by drivers of automobiles, and in several cases around the large eastern cities, automobilists riding two-wheelers have found out what treatment many drivers give the rider and have acted accordingly. Outside of the justice of the thing, those who enjoy both sports should fraternize, for the machines have a common origin; the first automobile was a motorcycle.

Gottlieb Daimler, the grandpa of the motor-vehicle, in 1885 built a four-cycle air-cooled motor which he mounted in the frame of a wooden bicycle vertically. On a crankshaft he fitted a pulley with a round groove and drove the rear wheel by a round belt. An idler was provided, giving free engine by lowering it, and the rider had foot-rests where the pedals now are. The ignition was by hot tube; 1895 saw the jump-spark first used by de Dion on a high-speed air-cooled motor. So you see that we riders are actually older in service than those who drive on four wheels.

What We Had in 1897.

This shows that the free engine device and foot-rests are not novelties and for that matter neither is the decompressor. In 1897 the real "racy" motorcycle was a tri-cycle with a live rear axle and an air-cooled motor back of the axle driving it by spur gears. I had one, with a sprightly (occasionally) little $1\frac{1}{4}$ h. motor, a cone clutch

and a small band brake on the differential. The starting of that 460-pound machine may be of interest, pointing out how easy it is nowadays. You first closed off the air by means of the little lever on the right side of the top tube, then you opened the gas valve (throttle) by a similar lever on the left side. Next the switch plug was put in the side of the battery-case, the spark retarded by a third little lever, and finally the compression was partly relieved by turning a fourth little lever. Then you pedalled violently, driving the outfit along with the clutch in, if it would stay that way. If all the settings were correct the motor would fire after 150 or 160 yards pedalling and you quickly; 1—closed the compression valve, 2—gave more air; 3—gave less gas; 4—advanced the spark. On reaching a hill you operated the air-gas and spark levers to suit, or you pedalled or pushed up that hill. If the hill was steep you helped the motor with the pedals. When the clutch took hold it bit hard, but the brake, operated by a hand-lever, always worked. The frame was rigid and the speed often 19 miles an hour. They fitted big $1\frac{1}{2}$ inch pneumatics, too. It was cheerful riding all around. When I hear a rider nowadays holler about his being a hard-starting machine I wonder how far he would have gotten with the de Dion "speedster."

So much for the past. Before 1914 we ought to see bigger improvements made than between 1897 and 1912.

VARYING SPARK PLUG SETTINGS

How Ingenious Device For Changing Position of Spark Points in Combustion Chamber Will Assist the Motor

A GREAT deal of difference in the performance of a motor will be noticed when different spark plugs are applied. Some plugs take up more space than others and so slightly increase the compression; others have the points projecting further into the combustion space than those usually fitted. These may cause a more rapid spread of the ignited gases, and sharper and more sudden ignition of the whole, making the motor livelier. Others, again, form pockets, which retain some of the burnt gases which are again compressed around the plug point, resulting in a less rich mixture just around that part. This is bad, because it is here, just around the plug points, that the very best mixture is wanted to fire immediately on the spark passing.

Often considerable differences in efficiencies can be got by a little experiment with different plugs. Some plugs are made with a big, long space up the inside, isolating the plug centre from the outside. The object of the makers is to preclude short circuiting by carbonizing and sooting up. These plugs are an advantage to motorcycle users who are too lazy to clean their plugs. It is possible, however, that by retaining around the plug centre some of the burnt gases they prevent rapid ignition, which is important if full power is to be obtained from the combustible charge.

If plugs are kept in proper order the best position for the points is just inside the combustion space, not in a pocket, and with as clean and flush a surface as possible so as to help get all the exhaust scavenged out away from the vicinity of the sparking points. A little experiment is, however, an advantage, as there are so many factors which affect the results, and different engines and different plugs all call for different treatment, but seldom get it. If really valuable data be required, nothing is better, when first commencing the tuning up of the motor, than an adjustable plug socket, by means of which plugs can be tried at different positions and different plugs accommodated.

This socket is unfortunately only applicable to side-by-side valve motors, as other types rarely allow of sufficient boss-surface in the heads or valve-chamber walls to admit of boring and tapping to larger diameters.

The method of arranging this is shown in the illustration. D is the valve-chamber cover, tapped out inside to take the threaded sleeve B, which in turn is threaded inside to take the sparking plug and recessed to accommodate the shoulder of the threaded part and the square. The plug will, of course, have to be operated by means of a box spanner. The inside of B is squared, or a couple of slots are cut down its side so that it can be turned with a bar spanner or key. By this means it can be raised or lowered in the cap D carrying the spark plug with it, and different heights of plug spark points can be obtained relatively to the combustion chamber head and the valve pocket.

In order to lock it securely in the desired position there is a case-hardened or tempered lock ring C, which is turned perfectly flat on the underside to fit in the top of the valve-chamber cover D and screwed a good fit around B.

In this way there is possible a very simple and convenient means of making adjustments to the motor which will allow experiments within certain limits, in the direction of reducing or slightly increasing the compression, and also in the way of pocketing the plug points or adjusting them otherwise relatively to the combustion space or the valve-chamber. When a machine is used sometimes for solo work and sometimes for passenger work, it may be found convenient to have a pair of sleeves B adjusted exactly to the two requirements.

WICKSTRUM WILL FIGHT.

P. W. WICKSTRUM, who was recently arrested by the Lincoln (Neb.) police for infringement of an ordinance prohibiting carrying a passenger on a motorcycle, and who was fined and sentenced to jail until the fine was paid, has begun habeas corpus proceedings to test the validity of the law.

A COLUMBUS ORDINANCE.

COLUMBUS, O.—An ordinance has been introduced in the local city council to regulate the use of motorcycles on the city streets. Excessive speed is prohibited, and all machines must be brought to a stop when signalled by anyone using a horse-drawn vehicle. Carrying children under seven years of age is also tabooed.

PIANO TUNER SAVES TIME.

L. E. WOODRUFF, a piano tuner of Coffeyville, Kan., whose territory comprises three counties, and who has heretofore made his trips in an automobile, has purchased a motorcycle and will henceforth use it to travel over his trade territory.

WORK will soon be started on a \$75,000 motordrome to be erected in Cincinnati, Ohio.

Paul McGrath, of Freeport, Ill., recently completed a motorcycle trip of 1,465 miles.

C. R. Calkins, milk inspector of Tacoma, Washington, uses a motorcycle in making his daily rounds.

A YANKEE ON EUROPEAN ROADS

MAXIMILLIAN ST. GEORGE

PERHAPS it would be well to state in the beginning that this article and those to follow are written by one who had ridden a motorcycle only one week before undertaking the trip which he will describe. In all he had covered only about 150 miles. The aim of these articles will be to show any one wishing to tour Europe the easiest and most economical way in which to travel by motorcycle. They will also deal with road conditions, customs regulations, and, naturally, with motorcycle troubles.

After crating my machine in Chicago I had the American Express Co. ship it to the White Star Line dock in Boston, Mass. On my arrival in Boston the day before sailing I called at the dock and found that some one, most likely the driver, had ordered the machine held for charges. At my request one of the White Star Line employees called up the American Express Co., and was informed that everything was all right. The next morning, two hours before sailing, I asked to have my machine put aboard, but the baggagemaster refused. I could not show him any receipts,

as the Edwards-Crist Co. had shipped it from Chicago, and I had no opportunity to get the papers from them. Not being able to induce him to change his mind, I called upon the Express Co. and had things straightened out. I reached the ship just as the gang-plank was being taken ashore.

The Arrival in Liverpool.

As I had shipped my machine as excess baggage it was put ashore on our landing. Another passenger who had shipped his as freight was not only obliged to go to the freight offices of the White Star Line, but also had to wait until the next day and go to the South Canada Docks, where he discovered that all his tools and a motorcycling coat had been stolen. The charge for shipping as excess baggage or freight was the same, \$5.25.

Immediately upon landing I had my machine carted to a garage, and was told that this service would cost 24 cents, but when presented the bill included the 24 cents cartage, 84 cents dock clearing charges and 24 cents commission. It is advisable to send the machine to some garage, such as C. W. Donkin & Co., Webster and Dale streets, or some good motorcycle shop, and there put it together, leaving the crate in storage. Storage charges on a crate are 24 cents per month. To ride in England a license is required, so as soon as my machine was assembled I went to the office and paid \$2.52 for a driving license and registration. From there I went to the Automobile Association and Motor Union Club at 134 Castle street, where I joined the club, paying \$3.24 dues. Here I made application for an international pass and passes for Belgium, France and Holland. I was also advised to take out triptyques for Germany and Austria, as these two countries do not recognize the international pass. The charge for the two would be \$3.15 and I would have to deposit the customs duties with the club. These duties would be returned to me upon the return of the third sheet of the triptyque. I did not take these triptyques, because I wanted to see if the international pass and membership in the Automobile Association were sufficient, and besides I did not care to spend that amount of money and leave a large deposit for customs at the same time. It generally requires a week's time to get all the necessary papers, but through special attention I did not have so long a wait.

Motor Trouble Aplenty.

With a rider named Owen, whom I had met on the steamer, I left the city after dinner, and it was indeed fortunate for me that I was not alone. If it had not been for Owen I do not see how I could have reached Chester. My first trouble developed in Liverpool, when for some reason my machine would not move. We looked it over and Owen found that my gasoline was not turned on! Next my clutch kept slipping, and when this was adjusted I found that my spark plugs were all coated

and that the engine was feeding too much oil. We finally reached Chester, about 4 in the afternoon. On stopping to inquire our way into the city my engine died. My cup of trouble was certainly full, and had I been alone I might have been tempted to take the first boat back to America.

This time we went over the machine thoroughly. We inspected the gas tank, the spark plug, the chain and tested the spark plugs and the magneto, but all to no avail. Then Owen disconnected the magneto cut-out and the engine pulled at once. We then rode over beautiful roads, amid charming scenery at a 30 mile an hour clip, slowing down only in the small villages, till we came to Blynhurst, near Stafford, Owen's home. I received a hearty welcome from Owen's father, and have changed my mind as regards certain English characteristics. I have always been of the opinion that the Britisher is cold and inhospitable, but that is to strangers only.

A Narrow Escape.

Owen and his brother accompanied me on my way to Stafford and Grantham. Just out-

The Cologne Cathedral.

Famous Cascade in Dresden.

side of Stafford we almost collided with a motorcyclist who was going at the rate of 40 miles an hour around a bend, and on the wrong side of the road. We had a close call. Nothing could be better than the English roads. I like to tear along at 40 and more miles an hour myself, but one can not be too careful in making the turns. The roads are well posted with danger signs, there being one at every cross-road, turn, descent and rail-road crossing and before every school. The speed laws are strict, and I was told that the police take pleasure in arresting anyone who breaks them. However, I hardly ever traveled less than 35 miles and was not stopped.

All along the road I met the uniformed agents of the Automobile Association, who, upon seeing my membership badge on the handlebars of my machine, always saluted. These agents or guards are on all the main English roads. They warn you of police traps, tell you whether or not the road is open, give you directions and in case of need ride to the nearest village for help. They are employed and paid by the association. On this run to Grantham I passed through five rain storms.

A Tandem Riding Exhibition.

I gave the Grantham folks a treat, by way of demonstrating the American style of double passenger riding. The English use side-cars with very few exceptions, and it is a surprise to an American to see how a lightly-built, 2½ or a 3 h. p. machine can travel over the roads and up hills, carrying a side-car. My baggage-carrier is a combination tandem and luggage affair, made by the Atlas Co., of Chicago. My bags were merely taken off and my friend took her seat on the carrier and we were off at a 30 mile an hour clip, much to the astonishment of the town folks.

I left Grantham at 10 in the morning and arrived in London at 5 in the afternoon, passing through Stamford, Eaton Socon and Barnet.

A Stop-over in London.

In London Mr. Spiegel, of the Essenkay Co., whose preparation to prevent punctures I have in my tires, entertained me. I stopped for the night at the Bruce Lodging House, on Drury lane, which is conducted by London County Council. Beds in partitions, called cubicles, cost 14 cents; better beds in larger cubicles, with washstand, soap and water and a towel may be had for 24 cents. One may lodge by the week for \$1.20. A good meal may be obtained for 15 cents.

At the Automobile Association and Motor Union in London I received my international traveling pass (certificate international de route); also a customs ticket for Holland and one for France, Belgium, Switzerland and Italy; a certificate of driver's competence and one for the fitness of the machine.

Advantages of the Association.

The international pass is a booklet of 40 pages and contains passes for all the countries you are apt to traverse. The advantage of joining the association and obtaining the passes is obvious.

The association endeavors to furnish the motorist with all the information he is likely to need. It gives full particulars in regard to the different customs and formalities. It gives a list of the hotels, repair shops, transport rates, insurance rates, itineraries of the chief routes, a list of road maps, road books and a great deal of general information. It also

Top picture shows a scene in one of Dresden's beautiful parks; Lower—The Brandenburger Gate at entrance to Berlin.

gives a handbook, compiled from practical experience, which contains a concise and complete resume of everything the tourist may need to know. The holder of a pass does not have to take out a license in the various countries, nor does he have to get number plates, as the one received in England is sufficient.

Convenience of Triptyques.

The chief benefit of having triptyques is that you leave your customs deposit with the association and not with the officials at the frontiers. The triptyque is a threefold sheet, of which the first portion is kept by the customs on entry and the second on final exit, while

the third is sent back to the association, on receipt of which they mail you a check for the amount deposited. The charge for the first triptyque on a motorcycle is \$2.55, and 60 cents is charged for each additional one. In Germany the duty on my machine would be \$8.48 and in Austria \$14.60, so I decided to pay the deposit as I entered these countries.

Having received all my papers I started for Dover, by way of Maidstone and Folkestone. The road passes Westminster Bridge to the Elephant and Castle, and down the New Kent road. Then the Old Kent road follows the train lines along New Cross road and through Eltham to Sidcup.

(To be continued.)

From ^{OREGON} Portland to ^{MAINE} Portland

by JOSEPH P. SHANTIN

ONE fine day last spring, A. J. Neisz, a very good friend of mine, spoke of taking a trip around the country to see some of the states outside of Oregon, and when I met him a few days later I told him I was on for taking a trip to New York and return. He readily agreed to this proposition and we prepared to bid farewell to Portland, our home city.

The next few days were spent in planning the route, and getting together the necessary equipment. I purchased a new 7 h. Flying Merkel, and Neisz had a 6 h. Harley-Davidson without free engine, which he felt would take him through. I had a small traveling bag made to carry only about twenty pounds of luggage, as I had found out on a previous trip to Mt. Hood how inconvenient it is to carry too much baggage.

Many friends said that I was foolish to attempt such a long trip on a single-track-er, as there would be too many hardships, and suggested that I travel by rail, if at all. However, I thought it would be a good outing and, knowing that the scenery would be much better by motorcycle than by rail, I decided to use my motor and to ship it ahead when the roads became too rough.

Start Made in Rain.

We left Portland during a heavy rain, consoling ourselves by thinking that a poor start might portend a good ending. We had good macadam roads for about sixteen miles; then we struck some sticky clay, which made it impossible to proceed. The mud clogged up under the mudguard and one could not ride even down hill without having to scrape the mud off every few feet. We came to the little town of New Era (18.5 miles) where we left our machines, but as we could not find meals or lodging there we walked ahead about half a mile to J. E. Bradtl's farm house. After hearing our story, Mr. Bradtl took us in for the night. It had rained ever since we left Portland and we were soaked to the skin by this time.

The next day brought clear weather but

the roads were still muddy. After going back for our machines we continued our trip as far as Gervias, a distance of 21 miles. Here we were the guests of Jacob Neisz, my companion's father. We stayed over for the rest of the afternoon and the following day, Decoration Day, waiting for the roads to dry a little. Then we left Gervias, headed for Eugene (95.3 miles), where we stayed at the University of Oregon overnight as the guests of my brother, George W. Schantin, who was attending college there. We encountered both good and bad roads and at one place we had to go off the main road on account of swollen streams.

Muddy Roads and Bad Hills.

On the evening of June 1, we found ourselves seven miles south of Roseburg, having traversed some good roads and also a very bad stretch of muddy road past Divide, where we had to walk for a stretch,

"We Left Portland in a Shower of Rain."

leading our mounts. That night we slept in a farm house. On Sunday, June 2, we made it to Gold Hill (85.6 miles). We had bad hills most of the way and an exceptionally bad one near Glendale. The stores being closed on Sunday we were unable to buy any gasoline and my supply ran out about four miles from Grant's Pass. I had to borrow some from my partner, and this lasted till we reached Grant's Pass, where we purchased some at a garage.

On June 3, we reached Hiltz, Cal. (47.9 miles). We had fine roads until we struck the Siskiyou Mountains, where we rode rough and steep hills for about seven miles. To make matters worse, my partner had the misfortune to break his handlebars at the foot of the mountains. He was about to go back to Ashland or Medford to try to get a new pair, but I persuaded him to wire the broken one together and have it fixed on the way. He was able to continue, but under difficulties. We had to ford several streams that day, which I did not enjoy, as in most cases the water would choke the engine and I would have to wade through.

We reached Kennett (123 miles) on June 14. The roads were mostly rough and hilly. We had to cross several creeks and took pictures of one. It was necessary to ride at night in order to reach Kennett, and this was dangerous, as I could not get my lamp to burn properly and the roads were hilly and winding. Neisz was considerably ahead of me when my light went out altogether, and my horn not being sufficiently loud to attract his attention, I had to fire a few shots from my revolver. This had the desired effect, and he came back at once, thinking something was wrong. We finally got the lamp burning and reached Kennett about 11 p. m.

The First Puncture.

On June 5 we had winding, hilly roads to Redding, where they improved, and from Red Bluffs they were good. My partner had the pleasure of getting his first puncture that day, and while I was waiting along

the road ahead of him a farmer came along with a load of hay and a team of mules. I was sitting on my machine, of which the mules seemed to take no notice until they got directly opposite me; then they took a sudden notion to make a detour around me, and upset the load of hay. It took the driver by surprise and he was peeved. He told me the best thing I could do was to move along, as his boss would make it hot for me if I stayed around. Neisz came along soon, and we continued our journey, not waiting for the boss to show up, although I think he would have been harmless. This was one of the hottest days of the entire trip. On June 6 we had very good roads to Lodi. We stopped over for three hours in Sacramento while my partner had his handlebars brazed.

On June 7 we reached San Francisco, having stopped at Stockton and Oakland on the way to visit friends. We had good roads all the way, except where we got off the main road for a short distance. I broke the bars under my saddle, the first breakage or trouble I had up to that time. We spent the next two days in San Francisco visiting friends, the main feature of our stay being a trip through the sugar refinery, where I saw more sugar than I ever expect to see again.

On June 10 we rode to Watsonville, having fine roads all the way.

More Puncture Trouble.

We reached San Luis Obispo on June 11. With a good start and good roads we expected to break our record that day, but it was my turn for hard luck, as I got a puncture. Neisz was ahead and we had only one pump, which he carried, so after repairing the puncture I sat down to wait until he would decide there was something wrong and come back. An auto came along in the meantime, and I borrowed a pump, and then was able to go on for a few miles until I had a blowout; my partner did not get away from me that time, and we soon had it fixed. Later I ran out of gasoline and could not borrow any from my partner, as his supply was very low. The nearest fuel station was

"A Mexican Section Hand Provided Tea."

eight miles distant, so Neisz went after gasoline while I waited. He had not gone more than a mile and a half when his supply was exhausted, but fortunately he stopped near a farm where they had an auto and was able to obtain enough gasoline to carry us both to the next town.

On June 12 we proceeded to Santa Barbara. We had good roads to Los Olivos, where they became rough and hilly. We both ran out of gasoline. Being unable to get any at several farm houses we had to walk two miles to a small store, where we got two bottles of it. The weather was very hot and walking was hard work.

My Partner Is Lost.

We reached Los Angeles on June 13. The roads varied, being partly good and partly rough. I lost Neisz about 25 miles north of Los Angeles by letting him ride past a little store, where I had been waiting for him. He was beating it along at a good rate, intending to overtake me, and I started out to

catch up with him. The roads branched, both leading to Los Angeles, and seeing a cloud of dust on the main road I followed it, but later found it was made by an auto. As it was hard to tell what my partner would do I decided not to go back to where the roads separated, but kept right on. I stopped at the first garage for gasoline and told them of losing Neisz, explaining that I thought I would be able to find him at the Harley-Davidson agency in Los Angeles. I left word at the agency that I would meet him at a certain time and continued on to Gardena to visit an old school-mate. Neisz happened to take the same road and stop at the same garage, and so learned of my plans, and I met him the next day.

We visited friends in Los Angeles on June 14 and 15, and also met Charles F. Gates, Pacific Coast F. A. M. referee. We spent the evening at Gardena with friends, and on June 15 we took a short ride to Pasadena. On June 17 we rode from Los Angeles to San Diego. We had a short interview with Mr. Gates, who took pictures of us before leaving San Diego accompanied by another motorcyclist. On June 18 we stayed over in San Diego visiting relatives, and the following day we left San Diego after investing in a canteen and extra gasoline cans. We had good roads until a short distance from Potrero, where they were bad on account of fresh grading. After that the roads for the most part were very bad, and it was hard to stay on the machine. We got into a grading camp that night and slept beside a stack of hay. It was quite cold, and we had to get the canvas cover doubled over us in order to get to sleep.

Through the Devil's Canyon.

On June 20 we rode from Dry Camp to Brawley. We got an early start, as the preceding days had been very hot, and it looked like another scorcher. The roads were poor, and we had to go through the Devil's Canyon (true to its name), which was several miles of big boulders and rocks. However, we had a little advantage, as it

Portland to Portland—Heavy Line Indicates Route Taken by Shantin Across the Country.

was downhill nearly all the way. Then we struck sand for the first time, and this stretch was bad. I took several spills and broke off a pedal, which made navigating rather difficult. I had considerable trouble in finding a place to repair the pedal in El Centro, but finally found an old bicycle pedal and had a blacksmith weld the tip on for me. We had fair roads from there to Brawley.

On June 21 we got an early start and made good headway for about 15 miles, when we struck sand. We had continued along in the sand for about three miles when my partner, having left his machine on the stand, informed me that he had seen enough and had decided to turn back. I was making fair headway, considering the conditions, so I decided to continue the trip alone, although somewhat afraid, owing to conditions of the country. We settled our accounts, I borrowed his camera for the rest of my trip and we parted about 9 a. m. that morning. I have heard since that he reached Portland safely after shipping his machine back. The sun came out very strong, and I made a little shelter out of a sage brush and kept beating the sun around it all day. In the evening I rode a few miles more, but could not light my lamp; the water had evaporated, and I did not care to take any from my canteen, as it was running low, so I slept out on the sand that night.

Long Run For a Pump.

The following morning I came upon the railroad tracks and followed them into Mammoth, a section station. I felt pretty sick, as I had not carried any grub with me and the heat seemed to have got the better of me. I felt a little better after drinking some tea obtained from one of the Mexican section hands, who also gave me a little breakfast. Traveling was rather rough now. I had let nearly all the air out of my tires when riding through the sand, and being without a pump since my partner had left, I had to beat it to the next station, about 13 miles distant, where I heard there was a garage. I borrowed a pump there from a Coast to Coast car that had been broken down. Then I had to lay around until late in the afternoon, when I had a chance to ride back. After pumping up my tires I continued on to Glamis, riding the railroad tracks, as they were much better than the sand.

On Sunday, June 23, I reached Yuma, and helped to load the Interstate automobile on to a flat car for shipment to Yuma. This car left Los Angeles before I did, but seemed to have had bad luck, breaking down twice. From late reports I understand they gave up the trip entirely. I cleaned my engine and tightened the belt before riding the tracks to Yuma.

Spills Break the Monotony.

Palomas was my destination on June 24. The Colorado River was very high at that time, backing up the Gila River, which covered the road in several places, so I rode the tracks to within a few miles of Dome, where the road was fair. I had some sand for a short distance and then fine roads to Castle Dome Mine, where I had dinner, and happened to meet A. E. Weeks, the motorcyclist who attempted to cross the desert a short time before. He was unsuccessful, having been almost exhausted when

picked up by the *Times* car, of Los Angeles. His failure was due to his machine having broken down with no water on hand.

A Narrow Escape.

On June 25 I rode to Phoenix. As it was very hot, I had started early, but took the wrong road for five miles, when things looked doubtful, so I turned back, which was one of the luckiest things I ever did, for the road led to a mine 60 miles distant with no water along the entire route, and I had a very scant supply of gasoline. The fellows at Palomas were very glad to hear the chug of my motor returning, as they had yelled their heads off when I left, trying to get me to take the right road. I did not hear them on account of the noise of the motor. I had expected to get gasoline at Palomas, but they would not sell less than a five-gallon can, so I took a chance with my scant supply and got what I needed at Agau Caliente. I had a few stretches of good road, but most of it was rough and sandy. I met a man along the road who asked me to mail some letters for him. One was addressed to a person in St. Louis, Mo., so I asked him if he would like me to deliver it in person, as I was to go through St. Louis. He agreed, but as there was no telling if I would ever get that far, I mailed them at Phoenix. A few miles farther down the road I met another party with a shy team which did not like the looks of my machine, so I had to stop. In talking with

the driver, A. G. Dyer, I found that one of the letters I had was addressed to his father, so he requested me to call on him, and I did. On arriving at Phoenix I looked up the Merkel agency and received good treatment at the hands of Mr. G. Sadler.

Friendly Camping Party.

I rode from Phoenix to a point 13 miles east of Roosevelt on June 26. I had my front wheel straightened and cleaned the machine before leaving Phoenix at 1 p. m. I passed the big Roosevelt dam and had good roads all the way. I met H. P. Deamund and a party of campers along the road, who invited me to a little supper, as it was just ready. I accepted.

The next morning, June 27, after breakfasting with the campers, I started out early and had good roads most of the way. I passed through the San Carlos Indian Reservation. At one place I passed a Mitchell car which had broken down in the sand. I struck a few miles of muddy road where a thunder shower had passed a few hours before and had difficult traveling, taking several spills. I had to cross the Gila River twice, and in doing so the second time I stopped to wash off the machine, forgetting all about the magneto, and when I got across I could not get the machine started. After trying a while I left the machine there and crossed back to a farm house for the night.

(To be continued in the next issue.)

EMERGENCY CYCLE SQUAD.

SAMUEL S. TOBACK, general manager of the A. Elliott Barney Company, has just created an "emergency squadron" and added it to the service department of the company, to give instant service by means of "minute men" to Hudson owners throughout the company's territory. The "emergency squadron" is now a permanent fixture in the department, which renders service to Hudson owners. It consists of a corps of men thoroughly versed in the mechanism of Hudson cars.

These men will travel along the main roads of the territory on motorcycles equipped with the tools necessary to make adjustments for Hudson owners, and will at regular periods "call up headquarters" to learn if their services are necessary. In addition to those who patrol the main roads will be the men who answer telephone calls at the office.

The "emergency squadron" will make adjustments on all Hudson cars; will make inspections on the road when Hudson owners are encountered and will leave no stone unturned to keep every Hudson car which any member of the "squadron" meets in good running order at all times.

DIDN'T SEE THE CALF.

CHARLES E. FARR, a dealer in motorcycles and supplies in Canastota, N. Y., passes this one along:

"A gentleman from our rural district was passing our busy corner a few days ago when an automobile and a motorcycle turned the corner abreast. The farmer dodged the car but failed to see the motorcycle and received a bump which damaged nothing except his dignity. The motorcyclist stopped and exclaimed: 'I tooted my horn, why didn't you get out of the way?'"

"'Well, young feller,' retorted the rustic, 'I dodged the ottermobile, but I didn't know the gol durned critter had a calf, that's why.'"

Heard it before? So had we, but good motorcycle humor is scarce and there ought to be more than one round of laughs in the above.

AMONG THE MISSING.

WBROWN, of 8015 Seventeenth avenue, Brooklyn, N. Y., reports the theft of his M. M. machine, which he describes as follows: It had the regulation circular M. M. tank, nickel-plated, maroon finish on frame, Eclipse free engine clutch, Standard speedometer, Bosch magneto, hand idler lever made of a piece of gas pipe, 26 x 2 1/4-inch Diamond tire on front wheel and 26x 2 1/2-inch Continental tire in rear. The lower tube of the upper frame construction was cracked just aft of the junction with the forward downrunner tube, and another distinctive mark will be found in the idler to which two ball-bearing roller skate wheels had been attached for contact with the belt. The machine had been used with a sidecar and should show marks of the fittings. Brown offers a reward of \$25 for the recovery of his mount, which was stolen on September 7.

READING WANTS MOTORCYCLES.

MOTORCYCLE mail deliveries for Reading, Pa., have been taken under consideration by the Postoffice Department in its efforts to solve the problems in this city's postal system. An inquiry has been directed to Postmaster High requesting his opinion as to the feasibility of the service for suburban work.

A MOTORCYCLE AMBULANCE.

THE police of Philadelphia have gone on record as the first to use the motorcycle as an ambulance. The precedent was established recently when a young man was thrown by a fire engine in the vicinity of the Keith theater. A motorcycle policeman carried the injured man on his motorcycle to St. Joseph's Hospital.

PITTSBURG TOURISTS.

R. L. BAKER and F. Hartman, Pittsburgh motorcyclists, returned to their home city a few days ago after a 3,500-mile tour. They left Pittsburgh on Sunday, August 18, and rode to Erie, Buffalo, Toronto and Montreal. Then they headed southward,

Hartman and Baker.

riding through New York State and taking in a part of Connecticut also. On their arrival in New York City they visited the Brighton Motordrome and witnessed one of the race meets. From New York they proceeded through New Jersey to Atlantic City and then to Philadelphia, from which point they made the final jump to Pittsburgh. They found good roads as a rule, and experienced no mechanical trouble. Baker reports that he did not have to touch his machine with a tool throughout the trip. The accompanying photograph shows the riders with their Excelsior machines, Baker on the left.

ON GEORGIA ROADS.

CARL H. O'BANNON, of the Claxton Ice & Coal Co., of Claxton, Ga., writes the following interesting letter concerning a motorcycle trip which he recently made to Statesboro, 25 miles from his home town:

"I have only been in the South a short time, and therefore I am not very familiar with road conditions. However, I have used a motorcycle for several years and have taken some long and hard trips, but for a short journey the one I am about to describe was certainly fierce. I ride a 7 h. twin M. M. with "V" belt drive, and decided that I could travel to Statesboro, 25 miles distant, without difficulty.

"I was told that I would have good clay roads, but found that they were anything but good, there being only two miles of clay road, and that was divided into stretches of about 200 yards. In places I could ride the side path, but at most points this was full of washouts and chuckholes. The sand was very deep and heavy, and I skidded and did all sorts of stunts. In many places I had to push. About every two miles I would have to cross a creek,

varying from 2 to 10 feet in width, and from 2 inches to 1 foot in depth. On each side for quite a distance the road was soft and swampy, and always after pushing my machine I would have a steep, sandy hill to start on, with a wet, slipping belt.

"In one place a clay causeway had been washed away, leaving a gap 10 feet wide and 6 feet deep. It being impossible to ride or push through, I had no alternative but to carry my machine across. I am not a weakling, but I must say that it is not an easy task to carry a 200-pound twin up a steep bank.

"Seventeen miles out I came to a small river. This was the last straw, so I turned around and started for home. I was so tired I could hardly move. Fortunately my motor was in good shape and I did not experience any trouble in this line. In trying to get in before a rain storm I got my first spill and bent a crank. When I was about four miles from home the rain started to come down and soon short-circuited the plugs. I set the machine on the stand and went under a tree, but was chased out by a number of rattlesnakes.

"Finally the rain stopped, but my motor was so cold and stiff that I could not turn it over. After considerable trouble and hard work I managed to get started, and after some more hard riding I eventually reached home, and home was never more welcome."

A TRIP TO NEW YORK.

J. WEBSTER EVANS, of Geigertown, Pa., recently made a motorcycle trip to New York city and return which he describes as follows:

"I left Geigertown at 6:15 a. m. on Friday, August 23, and made the run to New York in time to dine there at 7 p. m. Two hours and forty minutes were lost at Philadelphia, where I bought a new inner tube and other supplies. I had good roads and only a few hills on my run through New Jersey. I went via Camden, Burlington, Trenton, New Brunswick, Jersey City, and then to New York by ferry. For the return trip I left New York at 10:30 a. m., and rode to Pleasantville, N. J., along the shore road via Lakewood, covering 148 miles. Here I remained overnight, and in the morning I visited Atlantic City. I left for home at 10:50 a. m., going via Egg Harbor City and Hammonton to Camden, and then by ferry to Philadelphia. I reached the Quaker City at 1:30 p. m., and left at 2:45, arriving back in Geigertown at 6:30. I was delayed about an hour between Morristown and Pottstown by a blow-out. Four and a half gallons of gasoline were consumed, and the outlay for the trip was \$2.53, or an average of three-fifths of a cent per mile.

J. Webster Evans, Geigertown, Pa.

PLUCKY GIRL MOTORCYCLIST HAS HARD GOING

Miss "Cy" Woodman Reaches Rochester On Transcontinental Trip After Severe Falls and Ten-Days' Delay Following Spectacular Plunge Into a Mud-Hole—Interesting Experiences En Route.

By "Cy" Woodman

ROCHESTER, N. Y., Sept. 17.—I sure have had some rotten weather and heavy roads since starting on my New York to 'Frisco ride. It rained a portion of every day up to the time of my being stalled for ten days after a fall, and a steady downpour has delayed me during the last two days. The following will give any "would-be transcontinental motorcyclist" some idea as to the condition of the State roads: New York to Tarrytown O. K.; to Fishkill a long strip of No. 1 stone, which I ploughed through, my tires standing up under it; to Poughkeepsie good; to Albany excellent; to Amsterdam, rotten; here I carried my machine down thirty-six flimsy steps with a boy's help, and dragged it into a row-boat to be ferried across the river. On reaching the other side I was most agreeably surprised to learn the charge was only fifteen cents. From Palatine Bridge to Fonda will be found four miles of the worst road in this section of the country. It is well to look out for a "speed trap" at St. Johnsville. The road to Utica is fair except for the detour at Little Falls to Herkimer; further on the road is torn up for one mile. There will be found one excellent stretch of macadam road from Utica into Syracuse. From Cayuga to Geneva there is nothing but a sandy road-bed. Going into Rochester I encountered half a mile of No. 2 stone.

Welcomed Along the Route.

All riders along the road salute me and call out "Hello 'Cy.'" I have had a number of brushes with different makes of machines and what pleased me the most was the way my Flanders 4 took a hill that a twin of another make fell down on. Of course the rider blamed it to his weight (he claiming to weigh two hundred pounds.) It sure is laughable what gifts are thrust upon me; in some measure I am getting too popular for my own comfort. On stopping at farm houses I am loaded down with the most delicious chocolate pies and cakes and milk with real cream on it. Just think, this milk is only bringing two and three cents per quart wholesale. At one place the farmer queried as follows: "Be ye one of them pesky suffragettes?" My answer must have satisfied him, for I got the milk.

On the whole I don't know but what the worst feature of my ride is trouble with dogs, or just plain everyday muts, who will jump back and forth, seemingly playing tag with one, but incidentally trying to get a piece out of your legging. To be sure one has to expect a spill now and then (would rather miss it if it didn't come along), but when it takes the form of a nasty one, as the following will illustrate, it causes one to feel mighty thankful that the ride is only 3,800 miles. When I struck the bad stretch of road I am about to refer to, near Palatine Bridge, I shut down to about ten miles per hour, but my front wheel skidded in the soft mud, throwing me into a hole two feet deep and filled with muddy water. As I was going over the handle bars, I remembered to relax all my muscles and twist myself so as not to strike on my head and have any broken bones. There was a mo-

tor car coming slowly from the opposite direction and when it was about five hundred feet from me, the car was stopped and three men came running towards me, one saying as he came up to me: "My God! I thought you were killed." I replied, "Never mind me, but get my machine out of that hole." I was severely bruised from my waist down and my machine was damaged by the condenser in the magneto getting punctured. The men invited me to go back to New York with them, and on my refusing they drove off; as they went by I heard one say: "She's a plucky little devil."

A Delay of Ten Days.

I drew up to one side of the road and waited for about an hour until a team and farm wagon came along and with the farmer's help I lifted the motor into the wagon and had it carted four miles into town to the nearest garage. There I was stranded for the next ten days, waiting for my magneto to be returned from the factory. The day I left on my second start I ran into a speed trap at St. Johnsville, as I was endeavoring to make up lost time. A man dressed in a gray business suit stepped out from one side of the road and signalled me with uplifted hand, and thinking he might be some one with a message for me, sent on from the village, I stopped. Then he showed me his badge, informed me that I had been riding thirty-five miles an hour and said that I was to come along and explain matters to the judge. He said it wouldn't be necessary for me to walk into town and that I might ride in and the folks would tell me where the court was.

Well, I went back, and when I got into that town I started things moving right away. On learning that the judge was not married I saw it was up to me to try and create as favorable an impression as possible under the existing conditions, and I did. It does not seem possible that such a crowd could collect so quickly in a town of that size. Turning to the men I simply told them it was up to them to help me pay my fine by buying postcards, with the result that I was totally cleaned out and had to telegraph ahead for more cards to meet me on my next stop. When they discovered who I was I was sort of honorably discharged. A number of motorists whom I meet pay 25 and 50 cents apiece for my cards and in the evenings I sell them at the moving picture theaters. The next stunt that was pulled off was when my machine took some big hurdles, there being two large logs lying directly across my path. I took these hurdles when it was dusk, and really did not intend doing any real fancy riding. Just couldn't help it.

Weather and roads being favorable I make one hundred and fifty miles in a day of five hours' riding. On good clear stretches of road I have been making forty-five miles per hour. At Amsterdam the folks were somewhat skeptical and had the motorcycle officer pace me into Fonda. On his leaving me he saluted and said: "You made forty-seven, Miss 'Cy.'"

I was so keen on making up lost time that I thought I would go in for some night riding,

and not being equipped for such work, having only an oil lamp to use in cases of emergency, it came near proving my undoing. Every bump I took my lamp went out and one time I just skimmed the side of a horse and buggy, the latter being without a light. I rode this way until midnight and then my oil gave out just as I came to four corners. I could not see any guide posts and any road was a gamble, so I tooted my horn until a motorcyclist rode up. Just as he appeared I turned and ran into a ditch and up an embankment and was straddling my machine and holding it up, fearing to move lest I go down and out altogether when he hailed me. On looking up he said: "What in — are you doing up there?" I was feeling not any too lively, and answered: "Thought I would take a little run up here and look over things just for exercise." While talking things over this rider's light gave out and he started down the road striking matches to see if he could find a milepost; evidently he did not for he failed to return. After dragging my machine to one side of the road to a stone fence, I got my khaki skirt from my luggage carrier and with my sweater thrown over me I bunked by the roadside for the remainder of the night, watching the stars. At daybreak I was off on my way to Rochester and did the twenty-five miles into that city in just three quarters of an hour.

STANDEN STILL WINNING.

ST. LOUIS, September 15.—A large crowd was again treated to a clean sweep tonight by Albert Standen, the boy from the rural districts of Ohio. He has monopolized the racing at the popular South Side track to such an extent that the spectators know what to expect when the Oberlin flyer's name appears in the race list.

One feature of the night's racing was the improved riding of Henikman and Traffsky, who furnished some excitement for the spectators in their fight for second and third positions in the final mile of the ten-mile race.

It was announced that Brownie Carlslake had challenged Standen to three races. The local idol has accepted.

The feature event of the evening was the ten-mile free-for-all professional race. Standen took the lead after the first mile had been run off and was never headed, although Henikman pushed him hard for two miles. After this Henikman began to fall behind, putting him right alongside Traffsky. Then these two lads had their exciting fight for the second and third money, with Traffsky coming out on top at the finish.

Standen, riding for St. Louis, captured the four-cornered intercity match in two straight heats. The invitation professional race to be decided in the best two out of three heats, each heat being two miles, was won by Henikman in two straight heats, after a hard fight with Traffsky, who ran second in both instances.

KENNETH HANKINSON, a New Jersey farmer, is gaining knowledge regarding farming conditions, while on a motorcycle trip from New York to San Francisco.

TRI-STATE RUN PROVED EVENTFUL

Middletown Club's Endurance Contest Gave Riders Severe Test—Campbell's Game Showing After Injury Sustained in Fall.

DESIGNED solely to stimulate interest in motorcycling throughout a section of the country where motorcycles, while known, are not popular or numerous as yet, the three days' Tri-State endurance contest of the Middletown (Ohio) Motorcycle Club, held on Saturday, August 31, Sunday and Monday, September 1 and 2, proved to be all that its name implied.

At first it was intended to make this a big open run, but because of the lack of time for preparation and the conflicting race meets held in other nearby towns, it was decided to leave the affair open to club members only. The start was made at 1:20 p. m. Saturday, August 31, from the United States Hotel, at Middletown, the first stage of the journey being to Hamilton, where the roads were found fair but dusty. Just after the riders left Hamilton rain fell for ten or fifteen minutes, and this was followed by heavy hail, which made the red clay roads exceedingly slippery. In fact, there was not a single rider in the party who escaped going into the ditch at some time.

Greensburg was set as a night control, and despite the rocky roads and quite a little tire trouble, all of the riders got into Greensburg before the checking time, 6 p. m., with the exception of Andonie Corsie, of Middletown, who rode a 7 h. p. Indian. Corsie had tire trouble and later broke a priming cup. He did not arrive in Greensburg that night at all and was officially out of the contest. The distance to Greensburg was 80.6 miles. The second day's run was a real contest in many ways. The riders were checked out of Greensburg at 6:30 a. m., the route being to Horace, West Port, Sherwood, to North Vernon, and from North Vernon through Seymour to Crothersville, Scottsburg, Memphis, New Albany, and thence to Louisville, where the checking in time was set for 1:30 p. m., with the limit at 2:30 p. m. The scoring was on a basis of 1,000 points, and checking in ahead of schedule time resulted in a deduction of 2 points for each 5 minutes late, and for being late at controls, 1 point for each 5 minutes.

The Sealbach Hotel was the official headquarters, and all the riders stored their machines with R. L. Davis, Pierce, Pope and Reading Standard agent in Louisville, where free stories, free cigars, and free other things were passed out by the generous Bob.

The first sign of trouble came between Greensburg and North Vernon, when F. L. Valiant, chain-drive Flying Merkel 6, blew a tire while rounding a sharp turn. Valiant rolled off into the ditch, but was unhurt. This turn was so treacherous he decided to wait and see what happened when the others came around. Standing on one corner with his speed camera poised, he was rewarded when Ford Sanford came around at 25 miles an hour. The machine slid out from under him and Sanford went slithering across the road, but without any ill consequences.

The roads were fair from Greensburg to North Vernon, with the exception of spots where fresh crushed rock had just been dumped. There was not a rider in the race but had cuts and blow-outs, and punctures.

Going out of Seymour deep sand was encountered, and this continued for a number of miles towards Louisville. The only real mishap of this stage of the journey was when

Jesse Campbell, of the Yale team, hit a large dog while going at about 35 miles an hour. The machine turned off into one side of the road and Campbell landed heavily on his wrist in the middle of the road. By the time Seymour was reached, where a stop for gasoline and oil was made, Campbell's hand and wrist were as big as his shoulder. He was in great pain but pluckily decided to continue.

At New Albany, just before crossing the Ohio River Bridge, a number of the members of the Louisville Motorcycle Club met the party and guided them across the bridge.

Top Picture—The Start from Middletown.
Center—Fording a Stream in Kentucky.
Bottom—Kentucky Moonshine.

Valiant was the first one to check in at the Louisville control, followed by a Yale trio, and a majority of the others in quick order. Emmet Huntsbarger, another of the Merkel riders, and Frank Leshner, of Dayton, also a Merkel rider, who were riding together all the way, got on a wrong road which carried them about 22 miles out of their way. Huntsbarger just got in by the skin of his teeth, while Leshner was eight minutes over the limit in checking in at Louisville. The second day's mileage was figured at 114.7, but as nearly all of the riders had to make detours on account of torn up road, the distance was considerably more than that.

The third day was from Louisville back to Middletown, a distance of 181.5 miles. The start was fixed at 6 a. m., but on account of ferry delays and other minor things the riders did not get started much before 7. This meant beating it all the way back to cover the 182 miles before 4 p. m., which was the checking in time at the Middletown control. The official route was from Louisville to Jeffersonville, to Marble Hill, Madison, Vevay, Rising Sun, Lawrenceburg, Cincinnati and Hamilton, while an alternate route through Kentucky was offered. The distance was about the same, except that the Kentucky route had the disadvantage of being dotted with about 30 toll houses at distances of 4 or 5 miles apart, which caused a lot of delay. Corsie, the Indian rider, who had shown up some time during the night and continued as a survivor, started off with the rest of the party. A few miles out of Louisville, Kinney, Indian single, who up to this time had made a splendid run all the way, went down and out with a broken piston. A few minutes later Ford Sanford, one of the Merkel riders, who up to this time had a perfect score, had a blow-out, and Huntsbarger, another of the Merkel riders, also had a blow-out, while Leshner picked up a big nail in his rear tire. These three mishaps necessitated a delay of about an hour and forty minutes, so that the Merkel riders had to open wide to make up time.

The Merkel riders report that from start to finish of the run none of them opened his tool box; all the trouble was with tires, and from this trouble no one was immune.

Perhaps the most noteworthy run, from a human endurance standpoint, was made by Jesse A. Campbell. Despite the fact that Campbell's injured hand was practically useless, he finished with a perfect score. He has been laid up with his arm ever since. Solid gold medals will be awarded to those finishing with a perfect score, and silver medals to the survivors. The list of perfect scorers follows: F. L. Valiant, Merkel 6; George Squier, Yale 7; Jesse Campbell, Yale 7; J. F. Meyer, Yale 7; R. E. Morrison, Indian 7; Ward Jones, Indian 7; Clayton Palmer, Indian 4. Leshner, Huntsbarger and Sanford, Merkel riders, had 998, 994 and 993 points, respectively, at the finish.

KEPT OPEN HOUSE.

INDIANAPOLIS, Ind., September 14.—The Indianapolis Motorcycle Club kept open house tonight at its new clubrooms, 334 N. Illinois street. Out of town riders who had come in to see the motorcycle races here today were the guests of the local club. A subscription list was passed among the local dealers and riders for the purpose of furnishing the club and over \$200 was raised. Pool tables, reading tables and chairs are to be purchased at once.

INTERNATIONAL TOUR

IN the article which follows Donald McKie, who is keeping "the log" for the Atlanta tourists during their European trip, deals chiefly with roads, traffic customs and garages in Germany and Austria. This instalment carries the tourists from Berlin to Leipsic and Dresden, over the line into Austria and on to Vienna and finally to Budapest. The next instalment of McKie's article will find the Atlanta quartet in Munich.

We remained in Berlin for a little over a week, and during that period, with the aid of our motorcycles we saw more of the city than we could have viewed in the same time by any other means of transportation. It also goes without saying that our trips were made much more economically than they could have been made otherwise. However, the street car system in Berlin is excellent, being operated by the city. There are no straphangers; the conductor allows only as many passengers as can be seated to board the car.

Traffic in Berlin is rather heavy at several points, but nowhere does it compare with that of downtown New York. There are some Berlin streets so narrow that traffic moves only in one direction, but there is always an officer stationed at these places to prevent a visitor from going wrong. On the whole motorists are well cared for in the German capital. One side trip out of Berlin that should not be overlooked is to Potsdam, the home of the royal family. The road to Potsdam is excellent and the run is about 30 kilometers.

Berlin to Leipsic.

We left Berlin on July 24, and with some difficulty found our way to the next small town. For some distance out of the capital the pavements are of cobble-

stones and worn macadam, but later they improved and were better than any highways we have back in the States. Aside from a few bad stretches in small towns these road conditions prevail all the way to Leipsic, a manufacturing city of 600,000 people and very few motorcycles. At the office of the Hamburg-American line we obtained a map of the city free of charge. With this we quickly found the points of interest, including the Victory Monument, erected in commemoration of the war of 1813.

A cross-cut put us on the main road to Dresden. One of our spare oil cans, containing Mobiloil B which we had bought in Berlin, began to leak and it was necessary to empty it. At Tergua we paid a toll of five cents for the four of us to cross the Elbe river. Riding along slowly we were overtaken by a man mounting a little 3 h. Wanderer. He accompanied us until one of our clutches gave trouble and we were forced to stop. We took the clutch apart and finally finished the repair with the aid of an Old Sol lamp and Presto tank. We then discovered that we were too

far from any town to ride in and decided to sleep by the wayside. We found a wheat field and crawled into one of the stacks.

Dresden's Points of Interest.

Early the next morning we rode on to a small town for breakfast. Then we headed for Dresden once more over a road which winds in picturesque fashion along the Elbe river. This route is fine until the rider nears the city where the roads are pretty well cut up. On the edge of the city one of our machines ran out of gas directly in front of a motorcycle shop. A policeman helped us to replenish the tank. Later an officer gave us an order in German which we did not understand. However, we thought it wise to move on and found that we had been using our machines on a street where motor vehicles were barred. It was a close call for us.

Dresden is a city of many good points. A week may be spent here profitably. No visitor should miss the art galleries and museums. We abandoned our machines for three days to visit them. We made a side trip to Bastei, 50

kilometers from Dresden over a fine road. All the hills, some of them really stiff, were climbed with my tandem passenger in his saddle. On leaving Dresden we struck mountains and some hard going. This leads us to suggest that motorcycle tourists should clean their motors in Dresden and put their machines in tip-top shape. They will need all their power, although the roads are uniformly good. It is only the mountain-climbing that may give some trouble.

Invading Austria.

Finally we reached Zinnwald, and a short jaunt brought us to the offices of the German and Austrian customs. The German officials stamped our traveling card

Mid-day Meal by the Wayside.

to show the time we left the country and then—directly across the road—we encountered the Austrians. We expected to be allowed eight days in Austria without any trouble, but none of the officials could speak English and our small knowledge of German prevented us from understanding the situation fully. We showed all our credentials, and they finally said something about 300 marks. We shrugged our shoulders vigorously to indicate that we didn't understand and finally we were allowed to proceed. The officers did not stamp our papers and we assume that we may remain in Austria as long as we please. However, there may be a surprise for us when we leave.

From the top of the mountain we obtained a wonderful view of the surrounding country. We rode down with our engines cut out, at times coasting at a speed of 40 miles an hour. The coast lasted for seven miles. Not once did we turn on power. Then we struck Tepitz, the first town in Bohemia. Gasoline came too high for us there and we rode on to Laun, where we filled our tanks at the standard price.

A Garage "Hold-Up" in Prague.

In due time we reached Prague, the chief Bohemian city, going in over bad roads and very steep hills. Here we were "held up" for the first time at a garage. Without inquiring the price we had five litres of gasoline put in our tanks, and then found that we were to be charged 80 hellers, or 16 cents per litre. This figures out at about 70 cents a gallon. We protested, but had to pay the bill. This suggests a tip for touring motorcyclists: Always ask the price of an article before agreeing to take it. This will save money and trouble.

In this district we saw a number of sidecars, driven usually with the Puch machine; twin cylinder mounts with flat belt drive. There were a few singles also with sidecars. All seemed to have two-speed gears. How a single can handle a sidecar in that mountainous country, even with two-speed gears, is a mystery to us. We spent the night at Stecken. The next day we rode only 44 miles, a heavy rain having left the highways slippery. We were soon through with Bohemia and rather glad of it. Motorcyclists will not lose much by leaving it out of their European touring routes. If we had to make the trip again we would skip this district.

A Short Stay in Vienna.

At Iglau, in the next State, we bought some gasoline which cost us 76 hellers, or about 15 cents a kilogram. We came to the conclusion that the reason there are so few privately owned motorcycles and automobiles in the countries we have visited is because the price of gasoline is out of all reason. We had a surprise, however, in Iglau for it was explained that a citizen of the place could buy gasoline about as cheaply as we do in America, for his own use, but when it is to be re-sold the government levies a tax on it. In other words, the visiting motorcyclist has to stand the gaff.

We reached Vienna at night. For 70 kilometers going to the city the roads are somewhat better than those encountered earlier in Austria, but not up to the standard of those in Germany and certainly far inferior to those of Denmark. In Austria the custom is to drive

on the left side of the road, but having had some practice in this in Sweden we have not been bothered seriously.

In Picturesque Budapest.

After leaving Vienna our next stop was at Budapest. Here, for the first time, we found a radical departure from the customs and dress of our own country. We found ourselves in an excellent position to study the people, for riding our machines appeared to keep us in close touch with them. The costumes are remarkable and quite picturesque. Roads from Vienna to Budapest are fair. The latter city is located in Hungary, we having passed out of Austria less than 100 kilometers from Vienna.

We climbed some mountains on the way but Budapest is worth an effort. Returning to Vienna we took a boat up the beautiful Danube river, its banks lined with ruins of historic old castles and forts. We experienced no trouble in having the motorcycles carried on this boat. We simply pushed them aboard as we do on ferries in America, but we were forced to drain the gasoline from our tanks.

(To be continued.)

SAN BERNARDINO RACES.

MOTORCYCLE races are scheduled to take place on Thanksgiving Day in San Bernardino, Cal., under the auspices of the San Bernardino M. C. Ray Peck, Graves, Seymour, Wolters, Samuelson, Balke and other well-known riders will compete.

BENEFIT RACES.

MEMORIAL races for the benefit of Mrs. Edwards, widow of Curtis "Cort" Edwards, were held at the Riverview Motor-drome, September 14 and 15. The entire receipts of both performances will be given to the young widow.

TOURED TO INDIANAPOLIS.

HERBERT ANDERSON and Roy Wilson, of Olathe, Kansas, recently completed a 3,000-mile trip from their home town to Indianapolis, Ind., and return. They were away four weeks and encountered considerable mud

WHILE warming up for one of the races in the meet held recently at Rockville, Md., Thomas Dedge, the well-known Maryland speedster, fell and broke his left wrist.

Atlanta Tourists Caught in Rain on a German Road. A Stop for Repairs.

SIXTEEN RIDERS FINISH LONG NEWARK RUN

Starters Numbered Twenty-Eight, But 325-Mile Grind Through Jersey Sand and Over Hills Into New York State Reduced the List by Twelve—Yale Team Scores.

TWENTY-EIGHT riders left Newark, N. J., at 6:30 p. m. on Saturday, September 14, in the 24-hour endurance run of the New Jersey Motorcycle Club, and late on the afternoon of the following day 16 dusty roadsters checked in after having completed the 325-mile course, which led them through southern New Jersey, up into New York State and back to Newark. The other contestants were forced out along the route by various mishaps. No statement could be made as to the exact standing of the finishers at latest reports, owing to the fact that the checking sheets had not been received from the controls at outlying points.

The riders were sent off at one-minute intervals from the club's headquarters in Washington street, Newark. The route carried them through Elizabeth and then southward to Perth Amboy, Keyport and Freehold. The first control, in charge of Roy Pascal, was established at the latter place. From Freehold the route was across the State to Trenton, where the riders were checked in by members of the Central Jersey M. C. at midnight. From this point the route was to Princeton, Somerville and Phillipsburg, where the riders stopped for a hasty breakfast just before daylight.

The wise ones replenished their supplies of gasoline and oil at this place before essaying to climb the hills of North Jersey, through Hackettstown, Newton and Sussex to Port Jervis, where the State line was crossed into

New York. Thence the route led to Newburg, where the turn was made for home.

The special trophy for the team with the best score goes to the Yale trio, composed of P. W. Stevens, Ortie Stevens and George Riechey, of East Orange. The Indian team was put out of running, and the chances of the Excelsior team went a-glimmering when Andy Bohsen, one of the members, broke his exhaust valve lift at Washington and came home on one cylinder.

Mrs. Clayton Cox, of Elizabeth, was the only woman to take part. She rode with her husband in a side-car, but the pair were compelled to drop out at Somerville during the night, as their supply of oil had run out and they were unable to find a garage open.

Caesar Canara, of Newark, a member of the Indian team, had a bad spill at Branchville when he attempted to negotiate a turn while traveling at 40 miles an hour. He went off the road into a ditch and received a badly cut eye and a gash in his scalp. Seth Eberhardt and Howard Hill, his teammates, stayed with him and helped him to a physician. They lost so much time that they decided to cut the course and return home.

The list of those who finished is as follows: P. W. Stevens, West Orange, 7 h. p. Yale; George H. Riechey, East Orange, 7 h. p. Yale; Ortie Stevens, East Orange, 7 h. p. Yale; E. W. Allen, Newark, 6 h. p. Excelsior; S. Benedict, Newark, 6 h. p.

Excelsior; Stanley Beach, East Orange, 6 h. p. Excelsior; Peter Bohsen, West Orange, 6 h. p. Excelsior; Fred Cordes, Maplewood, 7 h. p. Excelsior; E. M. Miller, New York City, 4 h. p. Flanders; Fred Voelker, New York City, 4 h. p. Flanders; Arthur La Roe, Perth Amboy, 7 h. p. Indian; James Fenton, Trenton, 4 h. p. Harley-Davidson; R. C. Queen, Tarrytown, 7 h. p. Excelsior; W. A. Ford, White Plains, N. Y., 6 h. p. Excelsior; Watson Kluczek, West Orange, 4 h. p. Harley-Davidson.

Following is the list of remaining starters, who failed to get through: Gustave E. Heppler, Newark, 7 h. p. Yale, out at South Amboy, spilled and bent frame; George E. Buchanan, Newark, 4 h. p. Excelsior, out at Hampton, ran out of gasoline; Elliott D. Holton, Newark 4 h. p. Excelsior, lost road and dropped out at Phillipsburg over one hour late; George E. Byrnes, Newark, 4 h. p. Reading Standard, stuck by Holton, out at Phillipsburg; Andrew Bohsen, West Orange, 6 h. p. Excelsior, broken exhaust lift, out at North Branch; H. F. Mansfield, Newark, 7 h. p. Yale, dropped out at Phillipsburg; Caesar Canara, Newark, 7 h. p. Indian, fell at Branchville and cut about head, dropped out; Seth Eberhardt, Newark, 7 h. p. Indian, and Howard E. Hill, Newark, 7 h. p. Indian, both out at Branchville, taking Canara to a physician; Mr. and Mrs. Clayton Cox, Elizabeth, 7 h. p. N. S. U. and side-car, out at Somerville, lack of oil; Fred C. Mohrfeld, Trenton, 4 h. p. Flanders, out at Hackettstown.

LONDON CLUB ACTIVE

Ontario Squad Boomed Interest in the Motorcycle by Holding a Series of Race Meets.

FOR the purpose of building up its own membership as well as furthering the interests of the Canadian Motorcyclists' Association and the game in general in the whole district of Western Ontario, in which there are many thriving towns, the riders of the London Motorcycle Club, headed by J. W. Cunningham, who happens to be the good vice-president of the Canadian Federation, have been conducting an active racing campaign all season.

First of all, the "Cockneys" featured a race meet in their home town on the 24th of May. They then "circuited" to the Chatham and Brigden "gasoline alleys" during July, and on September 7 they staged the best meet they have ever conducted at St. Thomas before a lively and enthusiastic crowd. With the exception of London, none of the other cities had ever seen any motorcycle racing before and the good accomplished can be better imagined than described.

The plan of arrangements for the St. Thomas show consisted of spending \$200 for advertising the event. The town was "plastered" with posters and circulars, while on the morning of the eventful day, an imported band paraded the streets followed by the riders on their snorting mounts.

The half-mile track at St. Thomas was not up to much, but the riders made the most of it and no races were hippodromed. The ruts caused several spills, in one of which A. Thorpe, of London, was thrown twenty-five

feet over his handlebars and his machine damaged, but fortunately no one was seriously mugged. A race had been arranged between an auto and a motorcycle, but this was called off owing to the non-appearance of the four-wheeler. It was later learned that this machine had been stalled on roads through which the "single-trackers" had traveled with comparative ease.

Four races were put on, including an unknown distance affair. T. Kerr, riding an Emblem, captured the five-mile single-cylinder race in 7:25, while the same rider with a one-mile start took the ten-mile handicap, with T. J. Maher, on a double-barreled Indian, second from scratch. In this event Maher had made up half of the margin between himself and the winner before the finish. Thorpe won the five-mile twin-cylinder contest, with Maher second and Kerr third. Time, 6:39.

A TUBING TIP.

CE. ANDERSON, an observant motorcyclist of Middleboro, Mass., calls attention to the fact that a section of the stem of an ordinary clay pipe will serve admirably as a connecting link between two pieces of Prest-O-Lite tubing. One pipe stem will make several "connectors" and it will be found just the right size for a snug fit in the tubing.

AT GRAND RAPIDS.

SEVEN events were staged in a race meet at Grand Rapids, Mich., on Labor Day, under the auspices of the Grand Rapids M. C. In spite of threatening weather a fair-sized crowd saw Byrne Hall Indian, Joe Poisson (Indian), and Gable (Excelsior), carry off the honors.

COAST-TO-COAST HIGHWAY

Motorcycle Men Agree to Boost Project Which Is Endorsed at Indianapolis Banquet.

INDIANAPOLIS, Ind., September 11.—Motorcycle manufacturers were not forgotten here last night at the Carl Fisher banquet, when the plan to build a coast-to-coast highway was endorsed. Toastmaster Bookwalter, in introducing G. H. Westing, who spoke in behalf of the motorcyclists, said:

"The motorcycle industry has grown until now it is ready to take its place alongside the automobile game, and no longer can the two-wheelers be looked down upon. I feel that the motorcycle manufacturers should be given great consideration in connection with the building of this highway."

Mr. Westing, of the G. H. Westing Company, then addressed the assembly. He said he felt free to state that the motorcycle manufacturers will heartily endorse the project.

Motorcycle manufacturers will be asked to contribute one-third of one per cent. of their gross profits for three years, or in other words, one per cent. of their gross receipts for one year. It is figured that if all of the manufacturers interested in building the coast-to-coast road will contribute on this basis more than \$10,000,000 can be raised by the first of next year and the road can be finished in three years' time.

E. FRANK WINFIELD and his wife who are making a long tour through the west, reported at Grand Junction, Col., on August 30 Up to that time they had covered 1,124 miles.

FAST FINISHES IN BRIGHTON MATCHES

BROOKLYN, N. Y., Sept. 13.—John McNeil, the Scotch rider, again proved his class by winning the special match race of three miles from John Cox, in straight heats, at the Brighton Motordrome tonight.

Arthur Chapple, on scratch in the six-mile handicap race, conceded a lap to the rest of the field. He caught the riders on the fourth mile and gained a slight lead which he held to the finish. Billy Shields tore after Chapple as he was passing the other riders and jumped from last place to second, in which position he finished. George Lockner was in third place.

Three heats were necessary in the Shields-French three-mile match race. The former won by inches in the final lap. George Lockner captured the three heats of the five-mile pro race, with Ira Vail second and Billy Wray third. Summaries:

Match race, three miles, between John McNeil, of Scotland, and John Cox, of New York; first heat won by McNeil, J. A. P.; time, 2:09½; second heat won by McNeil; time, 2:06½.

Match race, three miles; William Shields, of Syracuse vs. J. B. French, of Brooklyn; first heat won by Shields, Indian; time, 2:20½; second heat, won by French, Indian; time, 2:19; third heat, won by Shields, Indian; time, 2:18½.

Six-mile race, handicap; won by Chapple (scratch); Shields (1 lap), second; George Lockner (1 lap), third. Time, 4:14½.

Five-mile race, open, 61:00 Class; first heat won by Lockner, Indian; Ira Vail, Brooklyn, Indian, second; W. H. Wray, New York, third. Time, 3:49½. Second heat won by Lockner; W. Wray, second; Ira Vail, third. Time, 3:46½. Third heat won by Lockner; Ira Vail, second; Wray, third. Time, 3:47½.

MCNEIL DEFEATS CHAPPLE.

ARTHUR CHAPPLE, the Brighton speed king, had his colors lowered in the final heat of his match race with James McNeil, of Scotland, on September 12. Neither Chapple nor McNeil rode his own machine. Chapple attempted to start this eight-valve motor three times, but was unable to get it to run. He then took Lockner's machine and McNeil was placed on Billy Shields' motor. McNeil broke a valve on the first lap and the heat was not run until he got another machine. He mounted Wray's "Bearcat" motor and set out after Chapple.

Both riders got away to a good start, Chapple leading. He held the advantage for two and a half miles when McNeil opened up and passed him on the final lap, winning by an open length. The time for the three miles was 2:16½.

Herbert Ayrault, the late addition to the pro ranks, captured two heats of the three-cornered match race. He blew a front shoe in the final heat and was put out of the running.

John Cox on his new "War-whoop" rode to victory in the five-mile professional race. He won all three heats.

William Wray carried off second place and George Lockner was third.

The final event, a six-mile handicap, brought out six starters. Each man had one-half a lap handicap over Johnny Cox, who was on scratch. Cox was unable to make up the handicap and Lockner won the race by two feet from Billy Shields. French nosed out Wray for third place.

CHAPPLE'S MACHINE CRIPPLED.

BROOKLYN, N. Y., September 10.—Only two heats of the three-mile special match race between John McNeil, the Scotchman, and Arthur Chapple, of New York, were run this evening at the Brighton Motordrome.

The first heat was a runaway. Getting away on an even start, Chapple gradually drew away from McNeil and won by over 100 yards.

The second heat was more exciting. Chapple led for the first mile by a wheel's length. His front tire blew out on the beginning of the second mile and put him out of the heat and race. Chapple was riding at a terrific speed, and it was pure good luck that saved him from a serious fall.

John Cox was in a class by himself in the five-mile open professional race. He led the other riders across the finish in all three heats. The six-mile handicap race went to Herbert Ayrault, who had been presented with a two-lap handicap. McNeil started from scratch, but was unable to cut down the handicap and retired when half the race was run.

LOCKNER WINS BIG RACE.

BROOKLYN, N. Y., September 8.—George Lockner, the up-state rider, captured the feature event at the Brighton Motordrome tonight. He defeated Billy Wray, his nearest competitor, by over a mile. Earle Eckel finished third. Many stops caused the leadership to change frequently.

Lockner gained a lap on the field in the seventeenth mile, but lost his advantage when he retired for oil. He was five laps behind before he got going again, but soon cut down the distance. Shields stopped, due to feeling ill, but resumed his riding. He stopped again later in the race.

Lockner regained the lead on the thirty-fifth mile, but had to stop for oil again. Wray took the lead for a while, but fell back; Lockner again assumed command and finished strong.

John Cox led the field over the line in the six-mile handicap. Arthur Chapple was on scratch, all the other riders having a lap and 200 yards handicap.

Earle Eckel won the first heat of his match with James French after a close race.

CHAPPLE REGAINS LAURELS.

BROOKLYN, N. Y., September 14.—Arthur Chapple came back in form this evening at the Brighton Motordrome and defeated John McNeil, the flying Scotchman, in the second of their series of match races. He accomplished the feat in straight heats. The first heat was a runaway for Chapple, as McNeil had engine trouble.

In the second heat McNeil's motor was running splendidly, but Chapple led all the way. On the beginning of the third mile Chapple was in the lead by an open length, with McNeil gaining steadily. Chapple, seeing this, rode high on the bank of the track, forcing McNeil up against the fence and making it impossible for the Scotchman to pass him. Chapple kept his position and won by a foot. Chapple was undoubtedly afraid of the Scotchman, and his unsportsmanlike riding caused some comment.

ARRANGEMENTS have been completed for the second annual 100-mile race meet of the Marion (Ind.) M. C. It is scheduled to take place September 29.

DOWN THE STRETCH

September 26.—St. Louis, Mo. Race meet, under auspices of the Dayton M. C. on mile dirt track.

September 21.—Byberry, Pa. Race meet, mile dirt track.

September 21.—York, Pa. Race meet, York fair grounds; mile dirt track.

September 22.—Denver, Col. Race meet, one-third mile board track.

September 22.—St. Louis, Mo. Race meet under auspices of the St. Louis Motordrome and Amusement Co.; quarter-mile board track.

September 24.—Powell, Ohio. Race meet under the auspices of the Delaware County fair managers; half-mile dirt track.

September 25.—St. Louis, Mo. Race meet, St. Louis Motordrome Amusement Co.

September 25.—St. Louis, Mo. Race meet, Luna Park Amusement Co.

September 26.—St. Louis, Mo. Race meet, St. Louis Motordrome and Amusement Co.

September 28.—Toronto, Canada. Race meet.

September 29.—St. Louis, Mo. Race meet under auspices of the St. Louis Motordrome and Amusement Co.

October 3-12.—Birmingham, Ala. Race meet under auspices of the State fair management. Mile dirt track.

October 5.—Toronto, Canada. Race meet.

October 6.—Boston, Worcester-Providence. Under auspices of the Providence M. C.

October 12.—Salem, N. H. Race meet, Rockingham Park Co. Mile dirt track.

October 12.—Toronto, Canada. Race meet.

September 22.—Chicago, Ill. Third quarterly trial of the Englewood M. C. Ottawa and return, 183 miles.

A COLUMBUS MEET.

COLUMBUS, Ohio.—The Columbus Motorcycle Club is arranging to hold a racing meet some time in October. This action was taken because of the failure of the board track to draw sufficient crowds. The Columbus Motordrome Company is now in the hands of Receiver Jerry O'Shaughnessy, but no disposition has been made of the case as yet. The meet given by the receiver on Labor Day was a success from a racing standpoint, but a failure financially.

WON HIS WAGER.

W. H. MICHESON, a motorcyclist of Jacksonville, Ill., opposed the argument of other local riders who claimed a run to Galesburg, Ill., 130 miles, could not be made in less than twelve hours. He wagered that he could make it in less time and when the bet was accepted he started. He reached Galesburg in six hours, over rough and sandy roads and obtained an affidavit to that effect, thereby winning the wager.

POINT BREEZE TRACK CLOSED.

PPOINT BREEZE MOTORDROME, in Philadelphia, Pa., has closed for the season. It is announced that next year the infield is to be concreted and an entrance put in for the admission of autos. It is also the intention to hold different sports there during the 1913 season, such as aerial meets, marathon races, etc.

THE two side pictures at top of page and the two top views in lower layout show members of the Flying Merkel M. C., of Dayton, O., on a re-

cent outing. The large lower picture is of the Merkel agency in Spokane, Wash.; Merkel agency in Indianapolis appears at top of page, in center.

NEWARK'S COSTLY LESSON.

LITTLE remains to be said concerning the sanguinary affair at Newark—too many newspaper presses have already smacked glutinous lips over the sickening details—but what does remain is of such import that it should carry from coast to coast. The price has been a heavy one; the lesson should be proportionately far-reaching. To present the gist of that lesson is not the simplest of tasks, but in the rough it points to modifications in board-track racing; to calm and impartial action which will safeguard the future of a royal sport, which will protect racers from themselves and a thrill-seeking public from participation in another tragedy of the motors.

It is not the purpose of the writer to string mere words upon a thread of sympathy already sorely taxed. Newark feels the blow keenly enough. Officials of the motordrome have a full realization of their indirect responsibility, and everything possible has been done in behalf of the injured and those who mourn. These phases of the situation speak for themselves, so it is the primary aim of this article to look ahead; to suggest that the Tomorrow of board-track racing in America be relieved of some of the imperilling conditions which have darkened its Yesterday. How this reformative movement is to be launched and what its trend shall be are questions now engaging the attention of F. A. M. officials and of thoughtful motorcyclists the country over.

No reasonable person desires to place in jeopardy the financial interests of the board track promoters, for many thousands of dollars have been invested in the bowls; nor is it desirable or feasible to crimp competition rules so that motorcycle racing will enter the quoits and lawn tennis category of sports. To eliminate the element of danger in racing the single-trackers would be to give the sport its quietus. Still there are degrees of danger, and it should be possible to determine the point at which competitive endeavor verges upon unjustifiable risk. Manufacturers build 90-mile an hour machines and promoters erect bowls in which to spin them, all of which shows ingenuity and progressiveness; but is a 90-mile an hour speed essential to the survival of motorcycle racing on board tracks? We hope not.

A few days ago a racing man who has on several occasions heard the swish of the Grim Reaper's scythe, suggested to the writer that board-track racing should be confined to machines of 30.50 cubic inches piston displacement. He argued that competition could be as keen, the finishes equally as spectacular as

with the big twins, and that the danger—while still to be reckoned with—would be greatly reduced. Against this is thrown the argument that race followers, having once seen a motorcycle travel 90 miles an hour, would not pay to witness anything less sensational. If this be true there is something wrong with our national sporting spirit; we hesitate to accept this viewpoint. The suggestion relative to 30.50 machines may have its drawbacks, but a number of experienced racing men believe it deserves serious consideration, and it is offered for what it is worth.

To set aside the rider and his risks for the moment, one thing is certain; board track promoters can, and they should without delaying a single day, take steps to afford greater protection for spectators. Just how this is to be done, with justice to all concerned, is a knotty question. It has been suggested that a dummy fence be erected about three feet out from the bleacher and grandstand railing at the top of the bowl. This safeguard would keep riders clear of even those spectators who persist in hanging over the inner railing. It would obstruct the view to some extent and it probably has other disadvantages, but it would practically eliminate the danger of a machine striking a spectator. It has also been suggested that the perpendicular section of the track, above the incline, be built to a height of six or eight feet. This would lift the occupants of the seats out of harm's way, but it also has obvious drawbacks.

These are matters for calm consideration by the men who build board tracks and the officials who govern them. They must be worked out along practical lines, with due regard for the interests of track owners and riders as well of the spectators. It is not the writer's intention to advocate sweeping and unreasonable reforms, but simply to point out that the time has arrived to safeguard the future of a sport which, to put it mildly, is being jeopardized.

That unfortunate Eddie Hasha fainted while riding at top speed on the Newark bowl is the consensus of expert opinion, and it must be admitted that the conditions attending his accident might never be duplicated on a board track. Still it has been demonstrated that the danger incident to driving motorcycles at 90 miles an hour, even on the best of bowls—and the Newark track is conceded to be a model of its size—is far out of proportion to the amusement afforded race followers and the publicity returns derived by the motorcycle

field in general. Board tracks have helped materially to bring the motorcycle into the national limelight, but whether they have of late advanced the interests of the motor single-tracker along permanent and constructive business lines is open to serious doubt.

THE CAMPAIGN FOR SILENCE.

THAT it will require a persistent educational campaign among motorcyclists in this country to obtain anything like general consideration for the radical muffler reforms now being talked of by far-seeing designers goes without saying, but it is equally certain that without radical changes the omnipresent silencing problem cannot be satisfactorily disposed of. In a recent article by our English correspondent attention was called to a proposed expansion chamber, fitted just forward of the motor, and from which the exhaust gases were to be led by an extra long pipe to the rear. Theoretically, this chamber should be capable of holding about six times the volume of the cylinder capacity, and it would of necessity be a somewhat cumbersome fitting. It is for that reason, primarily, that the rank and file of motorcyclists will frown upon it.

Admitting that the expansion chamber or a considerably enlarged muffler will not be a welcome addition to the average mount, their claims to recognition must still be considered. All the larger American cities are legislating against the cut-out, and it is certain that any contrivance calculated to reduce the noise evil still further will have a most important bearing upon the future of the motorcycle. No other single feature carries more weight with the general public, that hypercritical body from which the army of motorcyclists of the future must be recruited. Accordingly the thoughtful rider should not balk at a concession or two made in the interest of silent-running.

Students of the silencing problem are apparently of one mind in saying that satisfactory muffling cannot be obtained with the small box commonly fitted, unless it is so constructed that the back-pressure will be excessive. In other words the present standard muffler does not fill the bill. It must either hamper the motor or offend the ear, and between these faults there is small choice. It remains for manufacturers to produce a comparatively small exhaust box which will give something like the degree of silence obtained with the expansion chamber, and this is admittedly a knotty task. The expansion cham-

ber embodies the correct principle of exhaust gas silencing in that it allows the gas to cool and expand before it is discharged.

For several years past it has been argued in these columns that the ideal muffler should have a capacity of six to ten times the volume of the cylinder, and this is borne out by recent tests in England. The capacities of the cylinders on the English motorcycles used in the tests were approximately thirty cubic inches, and the cubical contents of an expansion box five by twelve inches are 236 cubic inches, or nearly eight times the cylinder volume. Under these conditions the noise was negligible.

Exhaustive experiments conducted in England and continental countries eight or nine years back showed that excellent results were obtained through fitting an expansion chamber of moderate size with a pipe leading from it, the latter being sometimes divided into two or three branches. This, however, introduces the question of size and unsightliness once more and leaves the investigator just about where he started. The problem is a big one and proportionately important. Must the conservative motorcyclist ultimately accept the expansion chamber, or can standard mufflers be improved to meet the widespread and justifiable demand for more silent running?

A PUBLICITY BOOMER.

MEMBERS of the Oakland (Cal.) M. C. made the most of their publicity opportunities when preparing for the recent Motorcycle Day at Livermore, and the accompanying photograph shows a club rider with his machine placarded for a road trip. This booster is H. Conboy, of Alameda. To acquaint the natives with the plans for the big program and distribute advertising matter along the line he rode from Oakland to San Jose, a distance of about 50 miles.

CHASED FIRE TRUCKS.

NEWARK, Ohio, Sept. 19.—In an effort to discourage Newark motorcyclists who persist in chasing the fire trucks when they respond to alarms, the police recently caused the arrest of half a dozen offenders, three of whom were fined. George Stewart, Walter Kussmaul and Bun Coulter were each fined \$10.

Five miles out of Oshkosh.

Road washed out completely at Van Dyne.

THAT SENTINEL RUN.

IN the last issue appeared an account of the Milwaukee *Sentinel* run which referred to the many hardships endured by the participants, and the accompanying photographs go to prove that the reports of heavy going were

not exaggerated. Picture number 1 shows a stretch of road five miles out of Oshkosh. This is a fair sample of the mud and water encountered. In the second picture is shown a road washout; one of the riders may be seen throwing water on his engine to cool it.

LOCATING *That* PUZZLING "KNOCK" by the *Timely Tipster*

THIS is the time of year when motors that have given faithful service over all kinds of roads throughout the summer begin to develop little eccentricities that puzzle and annoy their owners. One of these kinks is likely to come in the form of a "knock," a mysterious click or a bump.

Unusual noises coming from the motor always indicate present or prospective trouble, and should be attended to at once. A light tapping is a sign of slightly premature ignition. Correct it by retarding the spark until the noise ceases. A violent knocking indicates looseness or breakage in some connection; in motors that have had considerable use the bearings may be worn, causing looseness of the crankshaft or connecting rod. Another cause of a violent knock is looseness of the flywheels on the shafts. This is not common. Before attempting adjustments necessitated by a knock always retard the ignition gradually to ascertain whether premature firing is causing the trouble.

A dull pounding in the cylinder may be caused by accumulated carbon; by having the plug points too far into the cylinder; by too rich a mixture or by premature combustion. Clicking noises indicate too much clearance between the valve stems and tappets. The clearance should be slightly less than 1/32 of an inch. A peculiar sharp bumping noise, difficult to describe, gives warning of a cylinder loose on the crankcase.

H. Conboy, of Alameda.

Conboy is one of the most enthusiastic motorcycle boosters in California.

TO DENVER AND RETURN.

COLUMBUS, Ohio.—Two Columbus motorcyclists, Joseph Miller and Jesse Allen, have arrived home after a trip to Denver, Col., lasting a little over three weeks. They rode Indian 7 h. machines. The boys suffered no engine or tire trouble during the entire journey. The roads were found to be in good condition with the exception of some of those in the state of Illinois. The boys left Columbus August 20 and returned September 12.

A SPARK PLUG WARNING.

"DON'T screw the spark plug into the cylinder too tight," says Emil Grossman, manufacturer of the Red Head spark plugs. "They only want to be tight enough to prevent the leakage of gas. If they are screwed in too tight it breaks the porcelain and ends their usefulness."

TED BURNAFORD, Benjamin Connor, Joseph Helfrich and E. B. Wagner, motorcyclists of Wilkesbarre, Pa., recently completed a 1,200-mile trip through Pennsylvania, New York, Delaware, Connecticut, Massachusetts and Rhode Island.

FRANK BAKER, rural mail carrier out of Bellevue, Ohio, says he has it on the other carriers. He rides a motorcycle and finishes his work in half the time his co-workers spend covering the routes with a horse and buggy.

FRED SCOTHORN and wife of Coffeyville, Kan., have just returned from a vacation which they spent on their motorcycle. They traveled over Oklahoma and part of Southern Kansas. The machine used was an American.

THE Kane Drug Company, of Coffeyville, Kan., has just purchased a 1912 chain-drive Excelsior motorcycle for use in the delivery department. They have been using a 1911 Excelsior machine.

TWO MERKEL TOURISTS.

DAVID EMERSON, of Berlin, and E. G. Gehring, of Meriden, Conn., who recently completed an enjoyable vacation tour on their Flying Merkel machines, appear in the accom-

panying photograph. They left Meriden and rode to Pittsfield and through the Berkshire hills to Albany, N. Y. Then they proceeded to Schenectady and along the Mohawk River to Little Falls; thence to Utica, Syracuse, Rochester and Buffalo. From Buffalo they proceeded along the shore of Lake Erie to Erie and thence to Cleveland. They spent a week in touring Ohio and finally visited the Flying Merkel factory in Middletown.

SAN DIEGO TO NEW YORK.

H. P. ARROWOOD, with L. J. Saunders as a tandem passenger, is en route on a motorcycle from San Diego, Cal., to New York city. They expect to reach New York in 30 days. The cross-continent trip will not be a new experience for Saunders, as he made a trip from the Atlantic coast to San Diego on the same machine last Spring. The route for the present trip will be to Los Angeles, Salt Lake City and Denver; thence to St. Louis, Omaha, Kansas City and Indianapolis. From there the route will be to Cleveland, Harrisburg, Philadelphia and then to New York.

IN San Francisco, Cal., eighteen motorcyclists were arrested in one afternoon recently for exceeding the speed limit, and a score of automobilists were given the same treatment.

BAKER'S DARING RIDE**Indianapolis Boy Forged Into Second Place on a Bare Rim in 100-Mile Race.**

INDIANAPOLIS, Ind., September 14.—Despite his desperate attempt to win the 100-mile race here this afternoon, Erwin G. Baker finished second to Frank Houff, of Terre Haute, who, like Baker, rode a racing Indian 7. Baker rode the last five miles of the 100-mile grind on a tireless back rim and brought the crowds of spectators to their feet cheering. The Indianapolis rider held the lead until the 95-mile mark was passed and then had to stop. His tire had blown out. His lead at that time over Houff was two miles, but while Baker was trying to get the tire to hold air Houff went into first place, and Creviston, of Marion, went into second.

Baker grew impatient, jerked the worn-out tire from his rear wheel and finished the race on the steel rim. He went in pursuit of Houff, who had gained more than a lap on him and

passed his rival once. He still had a mile to make up in order to win with just three miles of the race left to do it in, and the odds were too great. The best Baker could do was pass Creviston and gain second place. Houff finished the 100 miles in 1:44:43½, and Baker was fifty seconds behind. When Houff finished the race, it marked his second 100-mile victory this year, he having won the event at Terre Haute on July 4.

AN INTERNATIONAL WINNER.

DEVAY, a French rider, recently won the international motorcycle race held under the auspices of the Automobile club of Sarthe at Le Mans, France. The distance was 246 miles, which Devay covered in 15 hours 12 minutes 35 seconds, about 48 miles an hour.

ARRANGEMENTS are under way to hold motorcycle races in Watertown, N. Y., and should the attendance warrant it a series of events will be arranged.

**BIG RUN TO OAKLAND.**

THE most successful road program ever arranged by the Los Angeles M. C.—one of the pace-setters for big motorcycle doings on the Pacific Coast—was that covering the recent 1,000-mile trip to Oakland and return. When the Los Angeles riders arrived at the turning point they were given a rousing welcome by the Oakland motorcyclists, who escorted them to the clubrooms. There the ladies of the Oakland club served an excellent supper and everything possible was done to entertain the visitors. The next day was spent in riding about Oakland and visiting points of interest. After a stop-over of two nights and a day the Los Angeles squad took up the return trail along the inland route.

One of the accompanying photographs shows a group of the riders posing with the tire car which followed them throughout the trip to Oakland. The picture was taken in front of the checking station in Oakland, as was the other view, which shows several of the riders waiting to check in. The third rider from the right calls his machine "Gentle Jane" and has that name printed on his tank.

PATTERSON'S APPEAL

President Requests F. A. M. Commissioners to Work Untiringly for a Membership of 30,000 in 1913.

WITH a view of injecting official ginger into state and local commissioners of the F. A. M., President Patterson has prepared a letter announcing his policy as regards these branches of the organization work, and making clear his determination to bring about greater activity. He makes an appeal to present state commissioners to give their duties reasonable attention or vacate the office in favor of a rider who can and will make progress. The letter is substantially as follows:

"I recently looked over a list of F. A. M. state and local commissioners sent me, and I find that in the list of 39 state commissioners there have been only three new appointments during the last term. Before making any appointments of state commissioners I have asked them several questions: Are they willing to answer official letters promptly? Are they prepared to give the necessary time and attention to their duties? Are they willing to appoint a local commissioner in every county in their state where there are motorcyclists?

"In going into the list more deeply I found this note opposite a commissioner's name: 'Don't know whether he is a good official because he has never answered the letters I forwarded to him and has not appointed a local commissioner in his State.' There is something wrong when it is necessary to make a note of this kind.

"What is the matter with our State commissioners? Surely there is no excuse for such lethargy. If you are a commissioner and the office appeals to you get busy at once; if you can't do that be fair to yourself and the F. A. M. and resign so that a more active man may occupy the office. I have a letter from far-off New Mexico in mind. A boy from that section writes me that there are 'very few riders in this district, but I will get them all.' That boy is going to make good. He is going to get results because he believes in 'doing things.' In some instances, unfortunately, the state commissioner is a man who simply holds the office because he believes it is helping his business. All this must be changed. We want result getters. The chairman of the Membership Committee, the Board of Directors, the National Secretary and your President are anxious to help you. When you get a man into the ranks keep him there. Give him some attention. Keep tab on him.

"We want every rider who joins to 'stay joined.' To this end I am anxious to hear from a lot of riders throughout the country who are willing to accept appointments as State or local commissioners. We need a capable official in every county in each State.

We believe the motorcycle game is still in its infancy, and we hope to build it up until the old parent won't know the child. The F. A. M. and the factory folks must co-operate; everybody must work. If we start on this basis we are bound to get results. I have set the membership mark at 30,000 for next year, and feel sure that we will reach it. We are going to make many changes in the list of State commissioners, and this letter is intended to call the attention of F. A. M. workers to our policy."

PLENTY OF VIM IN "ZIM."

NOT long ago during a two-minute lull in the boosting campaign he is waging for Hagstrom products, President Patterson, the F. A. M. in general, good roads and a few other projects, P. E. Zimmerman, of Lindsborg, Kan., found time to pose for the photograph which is reproduced below. "Zim"—he uses the other two syllables only on state occasions—is general manager for the Hagstrom

Bros. Manufacturing Company, in Lindsborg, and is also local F. A. M. commissioner and newly-elected vice-president of the Kansas Short Grass Club. From all of which it will be inferred that he is about as active a motorcycle live wire as ever sizzled in western territory; and the inference will be correct. He was one of the original Patterson boosters and is now a tireless worker for the upbuilding of the Federation in Kansas.

J. E. Spann and T. Moreland Caldwell, of Amarillo, Texas, are touring through Colorado on their motorcycles.

CANADIAN GOOD WILL

President Spencer, of Dominion Association Extends Hand of Fellowship to the F. A. M.

SOON after taking up his duties as president of the F. A. M., Doctor Patterson addressed a letter to President K. R. Spencer, of the Canadian Motorcyclists' Association expressing the good will of the Federation toward the recently organized Dominion body and inviting Canadian motorcyclists to take advantage of F. A. M. touring privileges when in the States. In reply President Spencer forwarded the following letter to President Patterson:

"Your letter of greetings to the Canadian Association has just been forwarded to the writer. I may say, speaking personally and on behalf of the board of directors and the members generally, that we reciprocate the very hearty greetings of the F. A. M. and feel proud to claim as our friends an organization as splendid as your own.

"The rapid advance of the Canadian Association has been due to a very great extent to the hearty support and friendliness shown by Dr. Thornley and Dr. Gibson; nor must we forget Mr. Hamilton or Mr. Sauer's early work, and we feel that with your good self in the lead, as at present, our friendship must assume even greater proportions.

"We thank you for your invitation to make use of the Federation privileges in touring the United States. We believe that there will be a number of riders who will accept your invitation and we also trust to have the pleasure of entertaining some of your tourists in this country.

"We are very pleased indeed, while in Columbus, to feel such a warm and hearty handshake as that extended to our official visiting your annual convention, and we herewith extend to you our invitation, that you attend the next national meeting of the Canadian Association of which we will forward you further information later. Would be very much pleased to have Dr. Thornley and Dr. Gibson and any other members or officers that are able to come."

Upon receipt of this communication President Patterson issued the following letter for general circulation:

"It will be noted in the letter forwarded by President Spencer of the Canadian Motorcyclists' Association that the Dominion riders have a most friendly feeling toward us, and in turn I think we should avail ourselves of every opportunity to assist Canadian riders who may be touring in the States. There are good roads and many points of interest on both sides of the line, and everything possible should be done to encourage a feeling of fellowship and good will. I trust that Dominion riders will have every possible courtesy extended to them when in our territory."

AMONG THE CLUBS

A UTICA OUTING.

ABOUT thirty members of the Utica (N. Y.) Motorcycle Club recently participated in a run to Saratoga Springs. They started at 7 o'clock Sunday morning, with symptoms of a rain storm very evident. By the time they reached the first control the storm became a reality and it rained on and off for the rest of the day. Long before Saratoga was reached seven of the tandem riders were obliged to abandon their machines and continue in an automobile. Despite the hardships contended with, the riders were all glad they made the trip and they are planning a series of such runs for next season.

QUINCY CLUB ORGANIZED.

WITH eighteen enthusiastic charter members the recently organized Quincy (Ill.) Motorcycle Club has started a busy career. The first meeting was held in the Chamber of Commerce rooms and officers elected were as follows: Joseph Esler, president; Frank Kathmann, vice-president; Carl Futterer, secretary; Motorcycle Mike Menke, treasurer; Joseph O'Neill, sergeant-at-arms; Oscar Kathmann, road captain and Albion Smith, lieutenant.

BUCKS COUNTY CLUB.

A MEETING was held at Newton, Pa., recently to perfect the organization of the Bucks County Automobile and Motorcycle Club with an enrollment of nearly fifty members. One of the objects of the association is to encourage the rebuilding of the roads in the county which are in a very bad condition. It was decided to fix the initiation fee at \$1 with annual dues as follows: Auto and motorcycle owners \$1.50, other members \$1. Meetings will be held every second Thursday.

SAGINAW OFFICERS.

AT a recent meeting of the Saginaw (Mich.) M. C. the following officers were elected: Edward L. Wissmueller, president; Norman Deshone, vice-president; Arthur Bohnhoff, secretary; Louie A. Beierwalters, treasurer.

SEVERAL members of the Middletown (Ohio) Motorcycle Club recently returned to their home town after having toured through Ohio, Indiana and Kentucky.

A NUMBER of motorcyclists of Chambersburg, Pa., recently made a Sunday run to Winchester. At Greencastle they were met by a dozen or more Waynesboro riders.

THERE are over 200 motorcyclists in Mobile, Ala., who are enthusiastic about forming a local club, and it is expected that some definite action will be taken soon.

CLOSE FINISH AT BALTIMORE

Members of Maryland M. C. Covered 125-Mile Route with Warmbold and Frank Setting the Pace.

BALTIMORE, Md.—After a good deal of close figuring the committee in charge of the first sociability run of the Maryland M. C., held on Sunday, September 1, has announced the winners, and at the last weekly meeting the prizes were distributed. First honors were divided between George Warmbold and Charles Frank. The average time for the 125-mile run was 7 hours and 52 minutes, while Warmbold's time was 7:49½, and Frank's 7:54½. The limit for the run was ten hours and nearly all of the fifty starters finished within that time. Some, however, proved bad guessers and they were hopelessly out of the running.

The plan of some of the boys was knocked in the head. They had arranged to ride in pairs and time themselves, but their scheme received a jolt when they arrived at the clubhouse and discovered that after drawing odd and even numbers the holders of each kind were sent off in opposite directions. The result was that no one had any idea who would win and their calculations went sky high.

The other prize winners were: William Wood, third, 7:48½; J. N. Carroll, Jr., fourth, 7:58; J. Hannibal, fifth, 7:44; J. W. Owen, sixth, 7:40; W. S. Fisher, seventh, 7:39; Sam Ambach, eighth, 8:07; Charles Kirwan, ninth, 7:37.

So pleased are the members with the success of the secret time run that talk has already been started of holding a 250-mile endurance run from here to Philadelphia in the near future. On Sunday, September 15, the boys went on a triangular run to Westminster, then across country to Ridgeville for dinner, and then down the Frederick pike, home, covering eighty miles. The race for the diamond medal offered for the best attendance on runs is a close one, with Nelson Johnson in the lead.

THE Rochester (N. Y.) Motorcycle Club has voted to assist in carrying the message through their section of the State when the F. A. M. conducts the ocean-to-ocean relay race which it is now planning.

THE Harley-Davidson Motorcycle Club, of Philadelphia, Pa., recently placed a handsome player piano in the clubrooms. Four new members were taken in at the last meeting.

MEMBERS of the Berks Motorcycle Club, of Reading, Pa., recently made a trip to Atlantic City and Ocean Grove, N. J.

A MOTORCYCLE club was recently organized in Yakima, Wash. It will be affiliated with the F. A. M.

HELD A CITY RUN.

THE first city run of the season was held in Indianapolis on September 8 by the Indianapolis Motorcycle Club. The riders, after gathering at the monument, started on a tour of the city and picked up more motorcyclists as they traveled. The tour covered about fifty miles. Carl Sneider was tourmaster. He took the riders through all of the city parks of note, and pulled off an impromptu hill-climb at "Crow's Nest," near Riverside Park. The Indianapolis Motorcycle Club is settled in permanent quarters downtown, at 322 N. Illinois street. The dealers of the city are subscribing to a fund which is expected to reach \$200, and which is to be used for furnishing the new clubhouse. There are five rooms and a bath in the quarters, and the location is a good one.

FIGHTING LICENSE CASE.

NEWARK, Ohio, Sept. 16.—Newark motorcycle riders are interested in the outcome of a case which will be tried in the county courts here soon in which the city is made defendant and L. W. Thomas, a motorcyclist, plaintiff. Thomas was charged with violation of the ordinance requiring motorcycles to bear numbered license tags. He alleges that the ordinance is invalid. The measure provides for the payment of \$1 for the license fee and stipulates that the owner or rider is to receive two tags, "one to be attached to each side of the machine." Thomas alleges that the city gives but one tag (which is a fact) while the ordinance provides for two. He was fined \$10 and costs.

ST. AUGUSTINE CLUB.

A NEW motorcycle club was recently organized in St. Augustine, Fla., under the name of the St. Augustine M. C. More than twenty-five members were enlisted and the following officers were elected: R. C. Stephens, president; H. W. House, vice-president; L. R. Buckner, secretary; R. B. Merseve, treasurer. L. R. Buckner offered a room over his garage for a meeting place, and regular sessions will be held there.

ANOTHER CALIFORNIA CLUB.

AT a meeting of about 50 motorcycle riders of Orange County, Cal., held at the Bridwell Motorcycle shop, it was decided to organize the Orange County Motorcycle Club. A committee was appointed to outline a number of runs.

A SUNDAY RUN.

A SUNDAY run to Beaver Dam, Waupun and Juneau, was recently made by the motorcyclists of Madison, Wis., under the auspices of the Four Lakes M. C.

MANUFACTURERS

IMPROVED CORBIN MODEL.

THE design and construction of the Corbin brake have kept pace with the gradual development of the motorcycle to its present efficient state. Over 50 per cent. of all the motorcycles manufactured in America today are equipped with the Corbin brake.

The 1913 model of this well known brake

shows some interesting improvements over that of 1912. For instance, the arm connecting band has been improved. On one end of this band are two projections forming a nut lock which securely holds the nut and prevents its turning or jarring loose. The device is now much easier to attach.

Another improvement is a bracket attached to the lower side of the brake arm. The object of this is to keep the brake band from dragging on the drum or sagging when expanded. This feature also prevents loss of power or overheating.

GOODRICH PLANT EXTENSIONS.

THE growing popularity of Goodrich tires has caused an era of factory expansion at the already extensive plant of the B. F. Goodrich Company, in Akron, O. Several more acres of floor space will be added by the time the snow flies. Work has already been started on a six-story office building which, with a two-story addition to the present quarters, it is hoped will be adequate for handling the rapidly growing business interests of the concern. The structure will be of steel and concrete, faced with brick and finished in the most modern style. A new factory building, also six stories high, is rapidly nearing completion. This big addition is 270 feet long by 157 feet wide and contains 6½ acres of floor space. In the meantime, despite the lateness of the season, the factory is working day and night in order to keep up with the demand for its products.

MARVEL PLANT MOVED.

THE MARVEL CARBURETER COMPANY, formerly located in Indianapolis, Ind., has moved its entire plant to Flint, Mich. Some of the Indianapolis employees are continuing with them in the new location. Increased space and improved facilities throughout the plant will enable the firm to increase its carbureter output by about one-third for the 1913 season. Advance orders are already being received.

TO SELL PIERCE PLANT

Property of Buffalo Company Will Be Disposed of October 2—Orders Filled in Meantime.

A MEETING of the creditors of the Pierce Cycle Co. of Buffalo, N. Y., was held in Buffalo on September 12, before Barber S. Conable, referee in bankruptcy. In order to settle the affairs of the company it is necessary that the Pierce plant be sold and the court has set October 2 as the date for a public sale. The sale will take place at the Pierce factory, 6-22 Hanover street, Buffalo.

The history of the Pierce Cycle Company is more than ordinarily interesting. The company had its origin as far back as 1865, when the late George N. Pierce entered the manufacturing field with a refrigerator line. In 1890 Mr. Pierce began the manufacture of bicycles under the name of the George N. Pierce Co. The success of the company was marked. It was one of the few companies that did not join the trust, and its bicycle line eventually became and is yet one of the standard American products.

It was but natural that the Pierce interests should enter the automobile field, and this occurred in 1900. The success of Pierce Motorettes and Stanhopes made possible the high-powered Arrow motor-cars. In 1906 the business had grown to such volume that the bicycle and automobile interests had to be separated. The bicycle end of the business was continued by Mr. Pierce, and associated under the firm name of The Pierce Cycle Company. In 1908 the first American-made four-cylinder motorcycle was produced by the company and two years later came the single-cylinder model.

The cost of developing the motorcycle business was enormous, and during 1910 the company became financially involved; this precipitated a receivership on August 10, 1910. For some time the plant was operated by L. P. Hancock and M. W. Bennett as joint receivers. Later Mr. Hancock was made sole trustee.

During the term of the receivership the business of the company has increased 50 per cent. The reputation of Pierce bicycles, long since established, has been carefully conserved and the motorcycles, little known in 1910, are now sold in all parts of the world, and are everywhere famous for their excellence of design and construction. Pierce bicycles and motorcycles are today sold in all parts of the United States and in 17 foreign countries. The company has 800 established dealer agents, all of whom will undoubtedly continue to represent Pierce goods in the future.

The Pierce plant will undoubtedly be sold to an organization amply capitalized to continue the manufacture of both bicycles and

motorcycles. It will probably be a matter of only three or four weeks before active production will be resumed. The property to be disposed of consists of machinery, finished and unfinished stock, factory equipment, fixtures, etc. The inventory value is close to \$300,000. The manufacturing and selling organizations are intact and will undoubtedly continue under the new control. In view of the standard of its product and the well-known name of the company, it is a great opportunity for those desiring to enter a growing industry. As to the details of the sale, any information will be given by L. P. Hancock, trustee, No. 18 Hanover street, Buffalo, N. Y.

TO FILL PIERCE ORDERS.

PENDING the sale of the property of the Pierce Cycle Company, on October 2, the Court has empowered L. P. Hancock, trustee, to fill orders for motorcycles, bicycles and parts thereof. This will enable Pierce agents to continue their business without interruption.

L. C. Van Buren, who will establish Goodyear Branch in England.

NEW HAGSTROM LINER.

THE latest product of the Hagstrom Bros. Mfg. Co., of Lindsborg, Kan., is a self-vulcanizing inner-liner, which is a godsend to the motorist living in a rural community, and likewise to the tourist, as it can be inserted on the road.

In towns of 5,000 to 10,000 population in the West and Central West, it is almost impossible to procure the kind of cement which best serves the purpose of cementing inner-liners to the casing. The Hagstrom self-vulcanizing inner-liner is prepared with a coating of pure raw rubber cement of the highest quality, and it is only necessary to wash off the soapstone with gasoline and wash out the casing, inserting the liner after allowing a short time to dry. The ordinary heat produced by the tires while in motion causes this to vulcanize.

NEW TWIN FILLS OUT THE POPE LINE

MOTORCYCLE ILLUSTRATED is able to publish this week an advance photograph of the new Pope twin, a forthcoming production of The Pope Manufacturing Company, of Hartford, Conn. With the advent of this model into the world of motorcycles still another manufacturer will have rounded out a complete line of machines, finishing off with a two-cylinder model. The Pope line of motorcycles for 1913 will consist of three models, each filling a distinct field of its own. Model H, the first to be put on the market and which met with instant success, will be continued with an increased output, and there will also be a large production of Model K, more recently announced, a machine with a "big four" horsepower. The new twin will be a fast and powerful machine. The photograph gives an excellent idea of the latest Pope mechanical

construction, sturdy as well as attractive.

The factory at Westfield, with its enormous floor space and large complement of the most improved machinery, is in a great state of activity. There will be a large increase over last season's output, but as always, this company will proceed on a sound and conservative basis. It is stated by L. D. Harden, manager of the motorcycle department, that the twin will be ready for shipment from the factory in good time for the rush trade of 1913. Already many dealers have visited the factory and closed contracts for the new year. These have had an opportunity to see the new machine and their enthusiasm over it has been so great that they have placed large orders. Still others, who have learned of the new product by rumor, have signified their desire to close for the coming season.

TOURISTS AT INDIAN FACTORY.

DURING July and August no less than six hundred tourists stopped at the Indian factory, in Springfield, Mass., which is located on the direct road between Boston and Albany and Boston and New York, and have kept the company's force of guides busy all of the time. This is an average of seventy-five each week, which demonstrates that the company's slogan, "Count the Indians on the Road," is not without weight.

Many tourists, after inspecting the different departments in the factory, have been amazed at the number of operations necessary to make the Indian. Others stopped off expecting to see a plant which they would be able to inspect completely in about half an hour, but instead of this they have walked until they became tired, and there still remained some departments which they did not visit. There is hardly any time during the day that at least one of the guides is not accompanying a party through the factory. The number of men employed, 1,200, immediately interests the curious tourist.

The tourists are not confined to any certain territory, coming from all parts of New England and the Middle West, and many times the visitors are from the Pacific Coast. In glancing over the register it is seen that the New

England States are well represented, and the list also includes riders from California, Colorado, Nevada, Nebraska, Utah, Illinois, Ohio, Pennsylvania, New Jersey, New York, Delaware and Maryland. The weather makes little difference in the number of visitors to the factory; tourists often put their machines under cover and take advantage of a trip to the factory while it is raining. In good weather there is a daily string of machines in front of the factory, belonging to incoming and outgoing tourists.

Tourists visiting the factory find the guides most courteous, and should they wish to remove the sand and grit which accumulate while on the road they are escorted to a laboratory where all the necessary things are at hand. Oftentimes tourists come in such large numbers that it becomes necessary for them to wait in the reception room for one of the guides to return from a trip in the factory. The reception room is equipped with all the latest literature pertaining to the Indian motorcycle, and the tourists never fail to ask for a few pamphlets which contain valuable information.

Aside from the various forms of literature tourists are presented with pennants to fly from their machines, and should they desire parts of any description they are served as promptly as possible.

NEWARK MOTORCYCLE SHOW.

NEWARK, N. J., with about 600 motorcyclists, will probably have an independent show for the motor-driven single-trackers during the coming winter. Such a movement was taken up last year but there was not sufficient time in which to develop the plans, and the local dealers are making an early start this year in order that their project need not be side-tracked. They argue that enough dealers from Newark and neighboring towns can be interested to make an excellent showing and that motorcycling interest in the vicinity justifies the undertaking.

TRIUMPH CATALOG.

TYPOGRAPHICALLY attractive, well illustrated and straightforward in its descriptive matter, the first catalog of the Triumph Manufacturing Company, of Detroit, Mich., is a booklet calculated to give the new arrival in the motorcycle field a favorable introduction. It is made up of 20 pages, each of which has something of interest to tell veterans as well as prospective recruits. An application to the Triumph Company at 51-55 East Woodbridge street, Detroit, will bring one of the catalogs by return mail.

NEW MERKEL HUSTLERS.

CHAS. R. MILLER, for a number of years superintendent of The Miami Cycle & Mfg. Co., in Middletown, Ohio, tendered his resignation last week. Mr. Miller's going was a most amicable departure, as he desired to take a long coveted rest, following which he will go into business for himself. On his retiring the employees presented their former superintendent with a diamond ring.

Mr. Miller's successor is C. J. Kester, who left a responsible position with the Flanders Manufacturing Co., of Chelsea, Mich., to assume the superintendency of the big Miami plant. Mr. Kester is a thoroughly practical

C. J. Kester.

man, of 21 years' mechanical experience, and knows bicycle and motorcycle manufacture from raw material to finished product.

Another recent acquisition is A. C. Bryan, who will fill the newly-created office of production engineer. Mr. Bryan, until recently, occupied a similar position with the General Motor Co., and was formerly with The Flanders Mfg. Co. He is a college graduate, has taken his degree in both mechanical and electrical engineering.

Arthur Graves, one of the best known tool foremen in the country, is also a new acquisition to the Miami staff.

Testers Deysher and Dunkle Ready to Try Out New R-S. Singles.

MADE SEVERE TEST

New Reading Standard Singles on Trial Run Encountered Everything from Sand to Floods.

TWO testers, James Dunkle and J. S. Deysher, were sent out recently by the Reading Standard Company, of Reading, Pa., on what was undoubtedly one of the most severe trial trips to which a single cylinder machine has been subjected in the East. The tour was made for the purpose of testing two of the company's 1913 4 h. singles, and the route was mapped by President A. S. Deysher in an automobile, his aim being to give the testers a full-fledged endurance run. The riders headed westward for Pittsburgh via York, Chambersburg, McConnellsburg and Bedford to Greensburg and thence to Pittsburgh. On their return they took a northern route, retracing as far as Greensburg and going thence to Tyrone, Blaisville, through Pine Flats to Altoona, from Altoona to Williamsport and thence to Reading.

The testers admit that President Deysher made no mistake in outlining the route if he was seeking poor roads. They believe it would be impossible to map a more severe trip in Pennsylvania. In the vicinity of McConnellsville hills three and four miles long were encountered and some of them have sandy stretches, an unusual condition for mountain roads. Near Pine Flats and on the way to Altoona the roads were next to impassable. Heavy rains had left them little more than quagmires.

The riders gave a satisfactory report on the performance of their machines on their return. They had no engine trouble and were not compelled to walk or push their machines up any of the hills. They state, however, that no single-cylinder machine ever made could climb the hills referred to without being sorely tried. One of the riders broke a cable of his band brake and it was necessary to remove the rear wheel to make repairs. This was the only adjustment necessary on the trip.

The testers were not trying for a speed record, but considering the condition of the roads they made good time, covering the 611 miles in 42 riding hours. Seven and a half gallons of gasoline and five pints of oil were required for each machine, an average of about 81½ miles to a gallon of fuel.

WITH COLUMBUS DEALERS.

COLUMBUS, O.—With favorable weather and touring conditions about the central part of the state the sales of the local dealers are soaring again. Chas. E. Barr, local distributor for the Indian, reports several sales this week with the prospects of many more in the near future.

A. C. Edwards, Central Ohio agent for the Flying Merkel, has taken the agency for the De Luxe motorcycle also.

The Goodyear Tire and Rubber Company moved from its old quarters at the corner of Gay and Fourth streets recently, to the new three-story fireproof building at the corner of Fourth and Elm streets. R. A. White is local manager.

J. Otto Tressmer, former assistant sales manager for the Barr Motorcycle Co., has left the employ of the above company to take up work along the same lines for the Hendee Manufacturing Co., at Springfield, Mass.

Articles of incorporation were issued recently to the Pharis Tire and Rubber Co., dealer in motorcycle, bicycle and automobile tires, and rubber specialties.

BIRKENBACH IMPROVEMENTS.

COLUMBUS, Ohio.—L. P. Birkenbach, who conducts the central Ohio agency for the Thor, plans extensive changes in his establishment at 17 North Fourth street. He will take out the partition between the present salesroom and the repair shop, doubling the sales space. Later a large addition will be built in the rear for an up-to-date repair shop and garage. The changes will make the place one of the most modern in central Ohio.

AFTER NEW MEMBERS.

AS the result of a recent banquet and smoker of the Sandusky (Ohio) M. C. an active membership campaign has been started and eleven new members have been enlisted. Permanent clubrooms have been secured and the riders are planning for a busy social season during the winter.

MAKING RAPID PROGRESS

Canadian Association Takes Up Show Plans, Names Commissioners and Arranges for Its Annual Assembly.

TORONTO, Can.—The Canadian Motorcyclists' Association is becoming quite the lusty lad of the motorcycle governing bodies of the world. Organized only a few short months ago, it is already attacking the big problems of the game in the Dominion and a fine start is being made in the establishment of correct conditions in all parts of the country.

The directors of the association confabbed at a special meeting held in Toronto on September 8, when several urgent details were worked out. Several important recommendations were brought in for presentation at the annual assembly of the association, which is to be held in Toronto about December 15, chief among which was a motion favoring the adoption of the new F. A. M. rider classifications, to prevent any clashes between the two federations on this question.

The following district commissioners were appointed: British Columbia, G. W. Lillie, Victoria; Alberta, Roy McKinnon, Calgary; Manitoba, J. M. Moorhouse, Winnipeg.

A press committee was created and W. M. Gladish, of Toronto, was appointed the first chairman with power to work out the development of a national press service.

Dr. Thornley, chairman of the F. A. M. competition committee, was made an honorary member of the association in recognition of his invaluable advice and assistance in the formation of the Dominion organization.

An official emblem for the association, in the form of a twin cylinder engine design, surmounted by a beaver, was officially adopted. A form of a certificate for affiliated clubs and district commissioners was also decided upon.

A motorcycle show committee, composed of F. A. O. Johnston, Alex McLean and W. M. Gladish, of Toronto, was created to work up interest among the motorcycle manufacturers for the coming Toronto show to be held next February. It is planned to give full publicity to this event, as well as the convention of the association, in order to make both occasions something worth while for the Canadian trade and riders. The C. M. A. will have special headquarters at the coming show for the dissemination of C. M. A. particulars.

A STRONG COMBINATION.

F. D. FREEMAN, formerly employed by the Aurora Automatic Machinery Company, and for some time in charge of this firm's retail motorcycle sales in Cook County, Ill., is now associated with H. T. Roberts, who recently entered the field as a manufacturers' agent with headquarters at 538 South Dearborn street, Chicago. Roberts handles the lines of nine factories devoted exclusively to motorcycle products, and Freeman will devote himself from now on to boosting this line-up of standard accessories. He joined Roberts on September 1 and began his sales campaign at once.

NEW MILLER BRANCH.

ANNOUNCEMENT is made that the branch establishment of Charles E. Miller in Atlanta, Ga., will be moved in a few days to a new building at the corner of Harris and Peachtree streets, where one of the most thoroughly equipped motor supply stores in the South will be conducted.

NORTHERN ONTARIO "ROADS."

THE fate of a transcontinental automobilist who essayed to cross Canada from Halifax to Vancouver is an example of the experience which Harry Humphries and wife, the globe-girdling motorcyclists, may be confronted with when they attempt to "see" the Dominion. The motorist, Thomas F. Wibby, discovered good roads, comparatively speaking, in Eastern Canada until he struck North Bay, Ontario. In this section his machine broke down twice on the sand, mud and corduroy "highways," and finally, when the roads terminated altogether, Wibby was compelled to ship his car by train across Northern Ontario.

"Genial" Houston, who is traveling Minnesota and the Dakotas for the Minneapolis Motorcycle Co.

COFFMAN'S NEW LINES.

A. B. COFFMAN, who recently resigned as vice-president and sales manager of the Consolidated Mfg. Co., of Toledo, announces that he has arranged for the exclusive sale of Morrow bicycle coaster brakes and hubs, made by the Eclipse Machine Company, of Elmira, N. Y., and that he will also handle sales of the American Wood Rim Company's full line of bicycle wood rims and automobile steering wheels. Mr. Coffman may be addressed for the present at 120 Tenth street, Toledo, Ohio.

NEW MERKEL ADDITION.

THE accompanying photograph affords an excellent view of the new addition to the plant of the Miami Cycle & Manufacturing Co., in Middletown, Ohio. On the extreme right

can be seen the old factory, which is joined by the new structure. Two stories of the extension are shown in the picture and the third is now being put on. The section adjoining the old factory will be four stories in height.

NEW H-D FACTORY.

IN the accompanying photograph is shown the new Harley-Davidson factory, embracing 90,000 square feet of floor space, which will permit of doubling the company's output for the 1913 season. All five floors and the basement of the new structure are now in use. A building adjoining this factory is now being torn down to make way for another five-story extension along the same architectural lines as the one shown in the photograph.

The Harley-Davidson company's use of pressed steel parts in motorcycle construction has been so highly successful that the firm is now adding to the equipment in this department. Another big press, weighing 33,000 pounds, has been ordered and will be in position in a week or two. This latest addition to the family of Harley-Davidson presses will be capable of delivering a stroke of 200 tons.

PITY THE POOR TORONTOAN.

LO, the unlucky motorcyclist of Toronto! On Friday, September 13, Magistrate Kingsford, of Toronto, issued a declaration that in future no speeding cases would be settled out of court, and further declared that, as he believed that the offenses of the riders and autoists were becoming far too common, he would live up to the full letter of the law by which he could confiscate a machine for a period of three months on the third offense.

The range of other penalties which he will impose is: A fine of \$50 or one week's imprisonment or both, for the first charge; \$10 or one month's imprisonment or both, for the second offense; and in the third case, imprisonment not to exceed three months.

A fine feature of the law is that when machines are impounded they may be placed where the magistrate directs and charges for storage or care of the machine can be made for the full time.

W. D. Freeman.

NOTES FROM BAKERSFIELD.

CHARLES P. CLARK recently resigned as president of the Bakersfield (Cal.) M. C., as he could not devote sufficient time to the office. A. Hansen was elected as his successor.

W. A. Park believes he should have an interest in a few jails up the valley. He was arrested four times on a trip to Fresno recently and fined \$10 each time.

The Bakersfield Club held a tandem run to Fresno a short time ago, and as the distance is something like 228 miles, the affair speaks well for the endurance of the Ladies.

Jules Berges and D. Stoekel have formed a partnership and intend to open an up-to-date motorcycle shop. They are both excellent mechanics and have secured the agencies for M. M. and P. E. M. motorcycles. Dealers in Bakersfield look for big 1913 sales.

Two New Mesinger Saddles;
Tandem Attachments; A
Unique Three-Wheeler; Valve
Spring-Remover and Tail Light

NEW MESINGER SADDLES.

TWO saddle patents, outlining improvements of prime interest to motorcyclists, have recently been obtained by Frederick Mesinger, of the H. & F. Mesinger

Company, of New York City. Both saddles are unique in that they dispense with the standard coil springs at the rear and utilize ingeniously arranged leaf springs. Patent No. 1,036,877, issued to Mr. Mesinger on August 27, is described as follows:

The saddle post 10 is straddled by a clamp 12 resting on a shoulder of the post and fastened by a bolt 13. Figure 1 shows the clamp fitted to an upright post, but it may be turned at right angles for use with a gooseneck post. The clamp is made in the form of a yoke, and its shanks are provided with radial grooves to constitute a pair of friction jaws. These jaws are engaged by correspondingly grooved jaws 15 formed on the upturned ends of a pair of longitudinal members 16 (in top view). A bolt 17 pivotally connects the arms to the yoke, while by slackening the nut 18 the arms may be swung backward or forward to adjust the height of the saddle. Each arm has at its outer end a recessed seat 19, adapted to receive the forward end of a flat cradle spring 20, which is fastened to the arm by a flanged cap and bolt. The springs 20 are intended to be made up of several leaves in the front, diminishing toward the back, where but a single leaf may be provided. The rear end of each spring is bow-shaped and secured to the back of the saddle, as shown in the side view.

The two forward ends of the stay spring 29 are seated within a grooved plate 30 pivoted by a bolt 31 to a pair of slotted L-shaped brackets 32, which are adjustably secured to the frame 11 by the bolt 33. This arrangement eliminates side-sway.

The saddle top is provided at its back with a depending flange to the inner face of which there is attached a curved cantle 24.

This cantle is provided with a pair of forwardly extending apertured lugs 25 from which depend a pair of bolts 26. These bolts carry at their lower ends a pair of yokes 27, each of said yokes being adapted for the reception of the rear end of one of the cradle springs 20. The rear eye-shaped ends of these springs encompass a pin 28 passing through both of the yokes which thus constitute bearings for said pin.

The second new Mesinger saddle, illustrated herewith, for which a patent was issued on September 3 last, is constructed along equally distinctive lines.

To the saddle post 10 is secured a cradle spring 11 of the peculiar shape more fully shown in Fig. 2. The spring is U-shaped in plan, with its two shanks coiled upwardly and forwardly at their free ends. The body of the spring may be composed of a number of superimposed leaves at its forward portion, while its rear or vertically curved portions may be composed of a single leaf. Means are provided for securing the spring at its center to post 10. The form of clamp plates 12, 13 connected by an expansion bolt 14 that extends into a slotted sleeve 15 or post 10 and carries a coniform nut 16. The rear ends of the spring 11 are connected to the back of the saddle top 17 by means of a cantle 18 to which a pair of flanged lugs 19 are riveted. Each of these lugs is apertured for the reception of a depending bolt 20 arranged between the cheeks of a yoke 21 depending from lug 19. Through these cheeks passes a common horizontal pin 22, which thus bridges the yokes, and around which the two shanks of spring 11 are coiled. The saddle is provided with two stay springs 23, each coiled at its rear end around one of the bolts 20. The front ends of the stay springs are secured to a plate 26 adjustably connected to the nose piece 27 by set screw 28. Plate 26 is so secured to the cycle frame 29 that a

free play at the forward ends of springs 23 is insured and that at the same time the play may be accurately regulated. For this purpose frame 29 is straddled by a flexible strap 30 which is apertured as at 31 for the accommodation of a bolt 32. This bolt passes through a cylindrical sleeve 34 which is partly concaved to closely hug frame 29. It will be seen that links 36 permit a free play of the stay spring, so that great resiliency at the front of the saddle is insured.

It is argued for both saddles that they combine to an unusual degree the desirable qualities of strength and resiliency and that they afford the lowest possible riding position on all standard machines.

CIRCULAR TANDEM SEAT.

A TANDEM seat embodying several new features is covered by a recently issued patent taken out by Teunis DeYoung, Jr., of

South Holland, Ill. The seat proper is circular in shape and has a railing extending part way round it. With reference to Fig. 2, the seat is held in position on the supporting ring 3 by means of small clamps 4, carried upon the under side and projecting out over the ring. Secured to the ring and projecting forward and downward are the arms 7, the ends of which are fastened to the shock-absorbing springs 8. Also secured to the ring 3 are the upper ends of the supporting rods 9 which pass through the rear shock-absorbing springs 10 and have their lower ends secured to the lower ends of the springs. The guide rods 11 also have their upper ends fastened to the ring 3 and the lower ends of these rods are turned outward to form footrests. On the out-turned end of the guide on the right side of the machine may be fitted a small platform or footrest for side-saddle riding. The seat proper may be so shifted on the ring 3 that the passenger faces forward or to either side.

ANOTHER TANDEM DEVICE.

A NOTHER improved tandem seat covered by a recent patent is the invention of Virgil W. Phillips, of Chicago. As shown in

the illustration, a U-shaped frame is provided having depending arms 9 provided with holes 4 in their lower ends so that the arms may be mounted on the regular axle of the machine. The arm on the left side may be offset to allow for the belt or other transmission mechanism. Secured to the upper ends of the arms 9 are frame pieces 12 adapted with clamps 15 for fastening to the rear fork of the machine.

Secured to the frame pieces 12 is a U-shaped support 19 and fastened to the upper cross section of this frame is a spring 22 which extends back and is finally formed as at 22' so that the saddle may be placed in position. The spring 22 is maintained in position on the part 10 and prevented from transverse movement by the clamping piece 26.

Supported from the saddle frame are bars 33 and pivotally secured to them are legs 32 which are slidably connected with the legs 9 at the slots 40. At the lower ends of the legs 32 are footrests which may be fitted in varying holes to permit of adjustments. The attachment depends upon the regular saddle springs and the flat spring 22 for resiliency, the depending legs being permitted to slide at 40 in keeping with the degree of movement in the spring 22.

VALVE SPRING REMOVER.

EDWIN N. KRAEMER, of Cedarburg, Wis., is the inventor of a contrivance to simplify the operation of removing the valve springs of internal combustion motors. The accompanying illustration shows a side view of the device, and a section of the valve from which the spring is being removed. As will

be seen, the Kraemer invention is designed to compress the coil spring on the valve stem so that the cotter pin or other fastening may be removed and the valve taken out. The levers 16 are pivoted at their rear ends to a transverse member 17. The forward ends of the levers are bifurcated, or provided with recesses 18 to accommodate the stem of the valve when in engagement with the valve

spring. When the thumb-screw 23 is turned the threaded rod 21 is drawn in and the arms 20 operate upon the levers 16 to compress the spring.

NOVEL THREE-WHEELER.

WILLIAM H. WILLIAMS, of Statesboro, Ga., is the patentee of a unique design for a motor three-wheeler, fitted with a friction change-speed gear. Only one wheel is driven, the rear right hand one. The motor is placed horizontally on a platform and drives a horizontal friction disc. Along a horizontal shaft above this disc is a friction wheel which is in contact with the disc and which can be moved along the shaft to give any speed ratios desired. The latter shaft has a friction roller which drives the right hand rear wheel. A long lever regulates the position of the friction wheel on the disc and another steers the vehicle by connection with the pivoted front wheel. The platform carries the fuel tank, ignition apparatus, etc., and provision is made for guarding the front wheel. The frame is triangular as shown and the left rear wheel

runs free. A spring seat is provided for the driver. The patent, No. 1,036,396, was granted August 20 last.

NEW TAIL LAMP.

JOHN W. ERICKSON, of Chicago, Ill., has obtained patent No. 1,036,984 on an improved lamp, designed for attaching to the rear mudguard of a motorcycle. The lamp has several unique features, one being its integral casting with the plate or bracket on which the lighting device is fastened to the mudguard. This makes for rigidity and low cost of manufacture. The lamp projects only a short distance out from the mudguard, contains a rear window for illuminating the license number and may be used interchangeably for gas or electricity.

THE Jordan-Florea Drug Company, of Coffeyville, has just received a new Excelsior motorcycle for the delivery of merchandise.

A MOTORCYCLE CLUB will be organized in the near future at Santa Ana, Cal.

Erickson tail lamp.

HAVE YOU SEEN IT?

ROBERT J. BENTZ, of 910 Garden street, Kenosha, Wis., reports the theft of his single-cylinder, 4 h. Harley-Davidson machine, which was taken from his home on the night of June 22. The machine was a 1911 model, the serial number being 9774. It was fitted with 26-inch wheels, with a new Goodrich Bailey tread tire on the rear and a Morgan & Wright tire in front. It carried a Majestic tandem attachment, Purdy whistle, Columbia headlight and generator and a small aluminum tail lamp.

AN IGNITION TIP.

"SOMETIMES a wire breaks inside of its insulation and gives no exterior sign of the break," says Emil Grossman, manufacturer of the Red Head spark plug, "and this may cause all sorts of trouble. Very often the blame is laid at the door of the ignition department. Spark plugs are changed and magnetos pulled down needlessly, so it is a good thing before taking everything else to pieces to make sure that there are no interior breaks in the insulation cable."

ONLY THE NUMBER NEEDED.

AFTER a conference between Police Commissioner Geo. S. Hill and Superintendent of Police Eugene Birmingham, of Bridgeport, Conn., it was stated that in future motorcycle cops will refrain from going at a clip of fifty miles an hour when chasing speeding autos, thereby endangering their lives, as it is only necessary to secure license numbers. This step was taken to prevent a repetition of a recent accident.

A MOTORCYCLE ELOPEMENT.

AN elopement on a motorcycle, culminating in a midnight marriage, is now one topic of conversation among the inhabitants of Great Falls, Mont. The bride and bridegroom—Miss Loris M. Gervais and Edward H. Schmidt—are members of prominent families and adopted the two-wheeler to assist them in their plans of quietly marrying.

A WIDE-AWAKE "NEWSIE."

S. O. MURPHY, Jr., of Springfield, Tenn., although only fourteen years of age, is up at 4:30 every morning to deliver papers over a long route on his motorcycle.

IT is estimated that there are 6,000 motorcycles in Cook County, Ill.

MORE than 4,000 motorcycles have been registered in Wisconsin this year.

Just before the start—Participants in the recent reliability run of the Utica M. C.

BALKE IS DENVER STAR.

IN the races held on the Tuileries motor-drome in Denver, September 8, Charlie Balke made exceptionally fast time for that track when he covered a mile in 39 3-5 seconds. He also headed Slivers Boyd in a two-mile match race which was run in heats, winning by a small margin. Cox and Boyd rode neck and neck throughout the five-mile invitation race, which resulted in Cox winning by a foot. Cox's clever riding brought the crowd to its feet, and he was cheered for minutes after the race. A three-mile handicap in which Balke gave Richards a full lap, was the final event of the day. Balke was seriously handicapped by riding the roughest part of the track, and Richards finished 100 feet in the lead.

CLEVELANDITES WIN.

CHARZIN FALLS, Ohio, September 6.—Races held here today under the sanction of the F. A. M. at the Cuyahoga County Fair, drew a large crowd. Huntsbery and Kissig, of Cleveland, took the big events, while Norton won the novice. Fully four thousand people were on hand when R. S. Connell called the first event. Horse racing had cut the track up and slow time was made.

A TRIP TO HUNN'S LAKE.

ONE of the most successful outings ever conducted by the Poughkeepsie (N. Y.) M. C. was held on August 25 to Hunn's Lake. Weather conditions were favorable and there was a good turnout of the riders for the run to the amusement place. There a chicken dinner was disposed of and the picnickers indulged in various games until it was time to start the return trip. The accompanying photograph shows the party at the lake after a fine trip from Poughkeepsie. It is forwarded by Edward Ryan, a Poughkeepsie dealer who went on the run.

DECATUR'S ANNUAL MEET.

NINE interesting events made up the second annual race meet of the Decatur (Ill.) Motorcycle Club, held recently. Twenty contestants were on hand when the first race was called. L. P. Stone, of St. Louis, won the three races in which he was entered and furnished many a thrill. Summaries:

Five miles, singles: W. B. Cash, Merkel, first; M. Pensinger, Excelsior, second. Time, 7:14.

Ten miles, twins: F. Rudy, Harley-Davidson, first; W. B. Cash, Merkel, second; M. Slater, Excelsior, third. Time, 8:07. (Cut to 7 miles on account of accident).

Five miles, singles: M. Pensinger, Excelsior, first; A. Guy, Harley-Davidson, second. Time, 7:28½.

Five miles, twins: L. P. Stone, Excelsior, first; F. Rudy, Harley-Davidson, second; Paul Degner, Indian, third. Time, 5:38.

Ten miles, singles: Herbert George, Harley-Davidson, first; H. Bourgoin, Flanders, second; M. Pensinger, Excelsior, third. Time, 13:57.

Ten miles, twins: Paul Degner, Indian, first; Walter Scott, Excelsior, second; F. Rudy, Harley-Davidson, third. Time, 11:49.

Ten miles, singles: M. Pensinger, Excelsior, first; Herbert George, Harley-Davidson, second. Time, 14:36½.

Ten miles, twins: L. P. Stone, Excelsior, first; Paul Degner, Indian, second; F. Rudy, Harley-Davidson, third. Time, 11:37.

Five miles, twins: L. P. Stone, Excelsior, first; F. Rudy, Harley-Davidson, second; W. B. Cash, Merkel, third. Time, 5:45½.

A WASHINGTON LETTER.

FRANK LONG, of Washington, D. C., who has been acting as F. A. M. referee at recent meets in the Capital City and vicinity, forwards the following letter relative to the condition of the Bennings track and the policy of its management:

"In spite of the fact that local racing men have been holding out for a price of \$5 and \$3 per mile (first and second place, respectively) for riding on the extremely bad track at Bennings, races were run on Labor Day, the starters being four novices using long handle bars, etc., and just off the street. One man in particular who rode in the races gave his word in writing that he would stay with the other boys in any decision reached, some two weeks ago.

"It is beginning to be a pretty state of affairs when motorcyclists in a city like Washington cannot get together and demand reasonable compensation for risking life and limb by riding on such a track as Bennings. The meet was held under the auspices of the Building Trades Council. The local newspapers roasted the management for not having an interesting race card, instead of having 'four riders strung out a quarter of a mile apart in the races.'

"Bennings racetrack is considered by every rider who has visited Washington to be one of the worst tracks in existence for motorcycle racing, the sand in some places being from ten to fifteen inches deep. Dr. Thornley would do well to send an F. A. M. representative down (at expense of local riders) to inspect this track—the writer will gamble that the representative would recommend prompt action."

RAIN SPOILED PROGRAM.

ALARGE crowd gathered to witness the races recently held by the Peoria (Ill.) Motorcycle Club. Two accidents occurred, Paul Degner and Harry Reese, both figuring in spills. A storm, which came up after the third race, spoiled the afternoon's sport.

DIAMOND

29" x 3"

Motorcycle Tire

¶ We built a tire in which there were no weak points—built it with the kind of material and the kind of workmanship which could mean nothing but strength in the finished tire.

¶ We were the first to build a motorcycle tire as a small automobile tire, and are the only manufacturers who insert a breaker strip between the fabric and tread to properly distribute the shocks to which a motorcycle tire is subject.

¶ Service and safety are what this tire means to the rider. Booklet describing all our motorcycle tires on request.

*Most Efficient, Durable and Lasting
Motorcycle Plug on the Market*

NEW YORK MICA & MFG. CO.
AUBURN, N. Y.

**J-D Visible
Cured
This Man**

DIAGNOSIS—Ignition Trouble

PRESCRIPTION—One set J-D Visible
Spark Plugs

FEE—\$1.00 per plug—money back if
not absolutely satisfied

We can cure your ignition troubles, too. The
new principle embodied in the J-D VISIBLE
GAP SPARK PLUG enables you to locate and
cure ignition trouble at a single glance.

One look tells everything

Through the port in the porcelain—outside the
motor—you see if the spark is jumping the gap
in the central electrode. If the spark jumps,
but proper ignition fails to follow, then the
plug must be foul or the carburetion faulty. If
the spark does not jump, then trouble lies be-
hind in magneto or wiring or coil or batteries.
Knurled adjusting nut allows you to widen or
close gap. Opened, it intensifies spark and
cleans point automatically. Uses minimum cur-
rent, makes timing of engine easy, and permits
regulating of spark in any cylinder.

If your dealer has not yet put the J-D VISIBLE
PLUG in stock, we will mail you as many
as you want, guaranteed, prepaid on receipt of
price—just \$1.00 per plug. Write and tell us
the size wanted and make of motor.

JEFFERY - DEWITT COMPANY
555 Butler Avenue, Detroit, Mich.

The Baxter Side Car

Strong—Because of its re-enforced frame-work,
its solid Bessemer steel hub spindles, its scien-
tific construction throughout.

Light—Weight is less by 20 lbs. than that of
any other side car made. This is due to the
proper distribution of weights.

Comfortable—Its deep leather cushions and
its patented tension spring wheel tend to make
the Baxter Side Car the acme of comfort.

"Whitney" Chains Are Built For Strains

Every "Whitney" Chain has a reputation back of it, a reputation of having been tested in the most trying service and never failing to make good. We've made chains for years and through our untiring efforts to produce nothing but the best our chains have gained a remarkable reputation. You can't go wrong by placing a "Whitney" on your machine.

When making replacements insist on a "Whitney" and get acquainted with its merits.

The *Neverout* Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS
THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

The Emblem

"The Eager Motorcycle"

There are two ways of purchasing a motorcycle—one, by heeding the recommendations of an enthusiastic rider; the other, by a careful study, comparison and elimination. The second, we unhesitatingly affirm to be the best. Get catalogs from all the leading manufacturers; compare their various claims; study closely their different features, then—order an EMBLEM.

For Washington: F. M. Spinning, Seattle.
For the South: Henry Kiedel & Co., Baltimore, Md.

Here is the largest, most powerful, strongest and most efficient lamp made

Without doubt, "Old Sol" No. 8 has been a potent factor in promoting night riding. The rider feels a sense of security when he sees before him the brilliant beam of light, 1,500 candlepower strong, which shows every pebble, every bump, every feature of the road for nearly one hundred years ahead! "Old Sol" is as powerful as any and more powerful than most automobile lamps.

Its heavy gauge brass construction, its thick magnifying mirror lens, and its absolute absence of loose parts tends to make it tremendously durable.

Write for our booklet. It shows our complete "Old Sol" Line.

"THE COVENTRY" CHAINS WIN AGAIN

From France comes the news that O. C. Godfrey, on a Coventry equipped Indian, won the French Motorcycling Grand Prix, which took place over the Circuit de Fontainebleau, Paris, on August 25th. He covered the distance of 279 miles in 6 hours, 34 minutes, 59 seconds.

This news, while gratifying, is not at all a surprise to us, nor to the thousands of other "Coventry" Chain users. They know their perfect service-giving qualities, their absolutely non-stretching strength, their marvelous endurance. There's a reason for the perfection of "The Coventry" Chains. It's all in the method of manufacture.

WRITE US ABOUT IT.

SARCO ENGINEERING CO.

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of June 13 is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I am planning to take a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and I am looking forward to a very pleasant trip.

Yours very truly,

B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waking & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,

CHAR. A. TANGEMAN.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

MOTORCYCLISTS: To insure CONTROL and avoid accidents—insist that your machine be equipped with the

CORBIN Motorcycle Band Brake

¶ The 1913 model of this famous braking device—the original motorcycle brake—is the simplest, strongest and most reliable brake any motorcycle can require, however powerful. Adaptable to all makes.

¶ An improvement for 1913 is the nut lock formed by two projections on one end of the band. Prevents the nut turning or jarring loose. A further improvement is a bracket attached to the lower side of the brake arm. Keeps the band from dragging on the drum or sagging when expanded. Also prevents loss of power or overheating.

¶ Be on the safe side. About 50% of all motorcycles made today are Corbin equipped. Insist on the Corbin Band Brake for *your* motorcycle.

Write for new 1913 catalogue showing all Corbin brakes and hubs for bicycles and motorcycles.

PENNSYLVANIA

Oilproof

VACUUM CUP TIRES

FOR MOTORCYCLES

They're OIL PROOF and SKID PROOF!

This colossal improvement will give those dealers who handle Pennsylvania Tires a strangle-hold on the trade of their territory.

1913 is going to see the output of motorcycles more than doubled. There are upwards of 30 manufacturers now producing motorcycles of distinctive designs. One of these makers has contracted to produce 35,000 machines during 1913.

Think of the increased tire business! And think how much of it you can corral if you sell the only oil proof tire on the market!

CLEVELAND, OHIO: 1837 Euclid Avenue

An Independent Company with an Independent Selling

he great, big, smashing sales features of

Pennsylvania Tires have already "arrived" to stay because of their remarkable anti-skid and long service qualities and liberal guarantees. Now they're OIL PROOF. Motorcyclists need no longer fear the effects of riding over oiled roads or pavements or of oily garage floors. Pennsylvania Motorcycle Tires resist oil disease.

Whoop up this feature good and loud. We're doing it all over the nation in our largely increased consumer advertising. Cut in on the results.

Motorcycle riders are shrewd. They'll buy the tires that are safe and sound and lasting.

The attention of Jobbers and Dealers is directed to our selling policy. Write us early. Delay may mean that you will lose the sales—lead in your territory.

THE ACME SIREN MAKES 'EM JUMP

There is nothing like the personal application. Suppose you were sitting comfortably on a big hay wagon which was traveling at the proverbial snail's pace directly in the middle of the road, and you heard behind you a low wail which gradually increased to an ear-piercing crescendo shriek, and then gradually died away into a low moan—wouldn't you turn out first and look to see what it was afterwards? Of course, you would.

That's the response that is invariably given to the Acme Siren, the little horn with the enormous range. Have you seen it? It is new, it is effective, it is substantial and durable. The sound is produced by a revolving reed through which the air is forced by a plain bulb. The horn is of solid brass, handsomely nicked and retails at \$5.00. Send the money or ask for our booklet. Better send the money first—it saves time.

SARCO ENGINEERING COMPANY

112 Broad Street, New York

HENDERSON

4 Cylinders, 7 horse-power—\$325.00

The Henderson's great success has been due to the fact that it is more comfortable than any other motorcycle; holds the road better; and has more than enough power for any road or hill.

Significant facts—both for the rider and the dealer.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per

day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4.....\$5.50	28 x 2 1/4.....\$6.50	28 x 3.....7.25
26 x 2 1/2.....6.00	28 x 2 1/2.....6.75	29 x 3.....7.50
	28 x 2 3/4.....7.00	

Other sizes on application.

Ask Your Dealer for "Bricton" Detachable Treads

Ask the best dealer in your town to show you the famous "BRICTSON" Guaranteed Detachable Tread. If for any reason he cannot supply you, fill out the attached ORDER BLANK, pin your check to same, mail it, and I will ship you the treads on TEN DAYS' FREE TRIAL, and if you don't find them perfectly satisfactory within 10 days from receipt of treads, return them and I will cheerfully refund your money. NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and giving maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen 1/4-inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

COASTER BRAKE LICENSORS

**The Yale
has made
good and
this**

Proves it!

P. W. STEVENS, ORTIE STEVENS AND GEORGE REICHEY.

WE'RE going to "talk right out in meetin'." We want to proclaim positively and with decision that the YALE has made good—that it has proven conclusively that it has all the requirements of a perfect motorcycle: speed, power, strength, durability and comfort.

This has been amply demonstrated by the New York-New Jersey 24-hour Endurance Run of 325 miles on September 15th-16th, in which the Yale team, composed of P. W. Stevens, Ortie Stevens and George Reichey made a perfect score. Stevens copped the gold medal and Reichey got the silver cup. That's only one instance. Then there's that Middletown to Elyria run of August 31st-September 1st. Again, the Yale was the only perfect-score machine.

DOESN'T THIS PROVE ANYTHING TO YOU?

If past performances count for anything at all the Yale should be the machine for you to investigate.

Spartan *versus* Oak-Tan

Facts of Vital Interest to Every Motorcycle Belt User

Furnish the *right* belt for the *right* drive--this has been our *inflexible policy* for over sixty years. To it may be attributed that steady and constant growth, year by year, which has finally made us *the largest belt manufacturers in the world*.

Although the sale of Oak Tanned Leather is a large factor of our business *we know* positively, from exhaustive experiments, that Oak Tanned Leather is absolutely unsuitable for the strenuous work demanded of a motorcycle drive.

Our experiments proved that a motorcycle belt is subjected to the severest use--often abuse--of any form of belt transmission. For this reason we have had to produce a special belt for this special purpose and that belt is the famous

--Spartan--

THE ONLY MOTORCYCLE BELT FOR EFFICIENT, ECONOMICAL AND SATISFACTORY SERVICE—the motorcycle belt already adopted by 80 per cent. of the manufacturers of belt drive machines.

We are absolutely *honest* in our statements about Spartan Leather as compared to Oak Tanned.

Spartan Leather is specially made for extreme work and for use under all climatic conditions.

Oak Tanned Leather is manufactured primarily for inside or dry work under favorable conditions—when waterproof cement is used Oak Tanned Belts may be used successfully in damp places, but they will not withstand a continual wetting and drying *without* cracking.

Spartan Motorcycle Belts will resist oil, water, steam and heat, generated by excessive pulley friction—they are not affected by climatic changes—that we guarantee absolutely.

Oak Tanned Motorcycle Belts very rapidly deteriorate from exposure to oil and when subjected to the action of heat, steam, etc., they are quickly ruined.

To demonstrate: Place a sample of Spartan and one of Oak Tanned Leather in boiling water or live steam for five or ten minutes, or as long as you wish—allow both samples to dry out—then note the results. The Oak Tanned is absolutely ruined while the Spartan remains in perfect condition. Another test: Slip the motorcycle belt over the front pulley while the engine is running at high speed—the friction thus produced will generate considerable heat—the Oak belt is quickly burned—the Spartan remains uninjured.

Our Spartan guarantee is your protection and guarantee of an absolutely perfect transmission—we have not guaranteed or promised anything Spartan belts cannot or will not fulfill.

Manufacturers, Dealers, Riders, can you afford to take chances? We believe that we will gain your friendship and good will by giving you the above comparative facts, which we positively stand back of. Insist on Spartan—the name is stamped on each belt—and do not accept any belt that may look as good and is cheaper. The use of poor belts lowers the standard of any motorcycle and adds danger to the user.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubos, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

**THE MOST STRENUOUS TEST FOR MAN
 and MOTORCYCLE EVER ACCOMPLISHED**

From Portland, Ore., to Portland, Me., via the Southern Route—5,964 miles—is the remarkable trip that has just been accomplished by Jos. P. Schantin, of the former city. Schantin is now on his way back to Oregon, via the Canadian Route, and at last reports had reached Milwaukee.

Not once during this arduous journey has Schantin experienced the slightest mechanical trouble of any nature whatsoever, his Flying Merkel pulling him through desert sand, over mountain ranges and through mud that would stall most engines, without a miss in its rhythmic purr. Most remarkable of all is the fact that Schantin has the use of only one leg. Therefore, his machine was put to an extraordinary racking test, as his motor had to pull the rider and baggage at all times without pedal assistance. Another rider on a different make machine started with Schantin, but for a multitude of reasons gave up the journey while crossing one of the deserts of California.

The same kind of day-in-and-day-out service is yours for the asking.

TRACK BUILDER SUGGESTS SAFEGUARDS

Official of Company That Erected Brighton Beach Motordrome Shows How Spectators at Board Tracks May Be Adequately Protected.

REFERRING to the board track situation in a recent interview, Arthur Jarvis, of the Coaster Construction Company, of New York, which built the Brighton Motordrome, stated that in his opinion the coming season will bring the big bowls into even greater popularity.

"It would not surprise me," said Mr. Jarvis, "to find a board track in every city of 300,000 inhabitants or over before May 1, 1913. What's more, these tracks will be as safe as it is possible to make them. Builders must see that their tracks are scientifically erected, properly banked, solid in construction and free from waves and rough spots. These precautions are due the rider, who takes his life in his hands every time he goes out to compete in a race. He is subjected to enough necessary risk without having any unnecessary risk thrust upon him.

"Traveling at 90 miles an hour, the rider covers 132 feet of the track in a second and a single track girder half an inch too high will cause a bump that may throw the speedster. At least the rider and machine will be thrown into the air for an instant and during that time the machine is unmanageable. Only by great skill and strength can the rider regain perfect control. Sometimes he fails to do this and an accident results.

"To construct the grandstands in a solid manner, having the line of vision so arranged that the rider is in full view at all times and so that the spectators will be fully protected should a machine run wild, is the main problem for track builders. All tracks now in existence should be changed so that spectators are safe at all times. Sketch No. 1 shows the precautionary method adopted at the Brighton Beach Motordrome, under the sanction of the Commissioner of Buildings of Brooklyn. The 2 x 12 board, almost at right angles to the track, will deflect any machine striking it and have a tendency to throw it into the infield. True enough, the rider will be in danger should he strike this board but he will have a far better chance to escape fatal injury than if he rides up on the fence and crashes into a pole.

"Sketch No. 2 shows an improperly built track. The track board is built up in front of the posts for some distance, thereby inviting some of the more daring riders to do spectacular stunts. This should never be encouraged and the track should be so built that such riding will be impossible. In sketch No. 2 the seats are arranged near the front rail and during the excitement of a race spectators will hang over the rail, thus taking chances on being struck by a rider or his machine. If an aisle of four or five feet is left between the rail and the first row of seats no one will hang over the railing, and spectators will have a much better chance should a machine get beyond control.

"The speed possibilities of a properly-built board track are startling. A 36-second mile may be expected almost any day and something even better may be developed before we are a great deal older."

H. D. RHOADS, of Akron, Ohio, is responsible for the board track suggestions embodied in the sketch at the left of the layout on page 18, and at the right is shown a type of board track guard-rail now being used in France. Rhoads would have tracks constructed to allow 25 feet of racing surface, with a black line to mark the danger point at the top. Above this he would have a section of the track boarding about ten feet high and curving slightly toward the infield. If a rider went above the black line and continued up on the ten-foot section he would ultimately fall

Figure I.

Figure II.

back on the incline. Obviously, this would be a serious matter for the racer, but the spectators would be in no danger.

The French guard-rail is built out at right angles to the ordinary railing at the top of the track, and spectators may lean out on this without being in danger. Should a racer ride high enough to jeopardize the spectators he will strike one of the braces of this table-like rail and be thrown without bothering those who are looking down upon him. This safeguard is quite costly, but it would seem to be effective.

HOT AFTER TRACK FRANCHISES.

THAT board track construction, which was lively enough to satisfy the most enthusiastic race follower during 1912, will be given even more remarkable impetus during the next six months is evident from plans that are now cropping out on all sides. In connection with these plans promoters are besieging the F. A. M. Board of Directors for restrictive franchises, and the solons of the national body are finding it anything but a simple matter to do justice to all concerned.

One of the most interesting phases of the present track situation involves Dallas, Tex., where two factions of promoters are waging a hot campaign to land a restrictive sanction. Clarence Linz represents one of the factions and his application for an F. A. M. franchise was filed prior to one which was received from S. G. Arthur, representing another party of Dallas promoters. It was hinted at first that George I. Kremer was to build the Linz track, but the promoters assert that they will have their bowl put up only by a contractor approved by the F. A. M. On the other hand Arthur and his backers have offered strong arguments to support their application. By way of proving that he is not a small-scale operator Arthur has followed his Dallas request with applications for restrictive franchises in San Antonio, Tex.; Atlanta, Ga.; Birmingham, Ala., and Havana, Cuba.

Within the last few days telegraph wires have been kept warm between Dallas and the points at which F. A. M. directors are located, as a result of the forwarding of a mysterious telegram from Dallas. The trouble-making wire read as follows:

"Am backing Arthur in Dallas motordrome. Have signed lease and must proceed. Earnest-

ly hope may not be forced to race as outlaw track. We have only profitable location, as

competitors admit. Already obliged to start construction to open for State fair on twelfth.

"EDWARD MAGNUS,
"c/o Anheuser Busch Brewing Co.,
"St. Louis, Mo."

As this wire embraced a covert threat to proceed as an outlaw track Chairman Thornley, of the F. A. M. Competition Committee, started an investigation and Arthur and his associates have been bombarding the competition chairman and the members of the Board of Directors with telegrams denying that they or anybody connected with them concocted the telegram in question.

At New Orleans there are more board track doings. M. F. Bramley, known to race followers through his connection with the Cleveland motordrome, and the recently opened St. Louis track, is seeking a restrictive franchise for the Louisiana city and he is desirous of obtaining the same consideration from the F. A. M. in Detroit, Kansas City and Cincinnati. It is understood that Jack Prince is more or less interested in all the track projects that are being handled by Mr. Bramley and the inference is that Bramley and Prince intend to build and operate a string of the big bowls for the 1913 season.

THE SHIELDS AND LOCHNER TEAM.
Winning Duet in Twice-Around-the-Clock Grind on the Brighton Beach Motordrome.

24-HOUR
SQUAD AT
BRIGHTON
MOTORDROME.

From left to
right — Shields,
Lochner, Cox,
McNeil, Eckel,
Spencer, Chapple,
Ayrault, Wray,
Thomas and
Vanberbury.

WHILE the twice-around-the-clock whirl on the Brighton Beach bowl, September 20-21, furnished some exciting brushes and a stellar performance by Lochner and Shields, the winners, it was with some misgivings that the fans accepted the final scores. Confusion resulted from the fact that all the competing teams were off the track for three hours, owing to the physical incapacity of some of the racers. In the meantime Ayrault and Eckels, who were not entered in the 24-hour race, were sent out to amuse the spectators. With a view of keeping up continuous scores and boosting the final mileage the track management estimated scores for the riders covering the hours they were off the track, and this added to the confusion.

The score for the first hour was as follows: Lochner-Shields, $67\frac{1}{3}$ miles; Chapple-Spencer, 67; Cox-McNeil, $64\frac{1}{3}$ miles; Wray-Vanderbury, 64 miles, and Thomas-Veditz, $63\frac{1}{3}$. Wray rode for an hour and eleven minutes before signaling his partner to relieve him. The long grind was started at 10:10 p. m., and during the night the boys plugged away steadily. At daybreak the riders complained of cramped hands and kidney pains. Cox suffered an attack of palpitation of the heart and was forced to retire. At this stage of the game lack of training showed itself clearly in all but the Syracuse team, Lochner and Shields.

These boys were easily the stars. They were credited with 1,374 miles and two laps at the close of the race, when the contestants had actually been riding 21 hours. McNeil and Eckel were in second place with 1,371 miles, and Chapple and Wray had 1,365 miles allowed them. The Thomas-Veditz team went out in the sixth hour and in the tenth hour Vanderbury retired and Veditz teamed with Wray. In the twentieth hour Veditz went out and Wray teamed with Chapple, Spencer being also out of the running. There was some dissatisfaction when Referee Pitman permitted Eckel, a fresh rider, to team with McNeil following the retirement of Cox, as it was argued that he had a considerable advantage over those who had been riding from the start. All the surviving riders took desperate chances in the last hour and the big crowd that turned out to see the finish was rewarded for its trip to Brighton.

A MOTORCYCLE run to Aurora, Joliet and Chicago was pulled off by the Elgin (Ill.) Motorcycle Club, on September 29.

BIGGER OUTPUT PROMISED.

AURORA, Ill., September 30.—Fire totally destroyed the stock of the Fowler-Carnes Company, manufacturers of motorcycle clothing, in this city on September 26. As soon as possible after the insurance adjusters have finished their work the company will resume business, and it is announced that the manufacture of motorcycle garments will be taken up on even a larger scale than in the past. In view of the fact that Fowler-Carnes business has been increasing at a record pace of late the company's new home will make ample allowance for the increased output, and the firm will be prepared to meet every demand made upon it for the coming season.

WHITNEY EXTENSION.

ANNOUNCEMENT is made by the Whitney Manufacturing Company, of Hartford, Conn., that work will be started without delay on its new factory building, which is to be 50 by 180 feet. The structure will be of steel and concrete and will be located between the frame buildings which now comprise the west wing of the plant. No changes will be made in the firm's line of high-grade chains for 1913, the present products having met all the expectations of manufacturers and riders.

ARUN to Williamsburg was recently held by members of the Norfolk (Va.) M. C.

FROM Boston to New York in a day; could we do it? The question had been in mind and on tongue for some weeks; like "Topsy," it grew. Ten days ago Monroe, my brother, laid out a schedule calling for twenty miles an hour with an occasional ten-minute stop for replenishments, and as I am sure others will want to take a try at it, I will write it out in full later in my story. It looked easy, that schedule. We had had the Excelsior for three months and my brother said she was well worked in and ready for anything. The Majestic torpedo side-car had been on the road for two weeks and none of the long rides we had taken had developed the slightest fatigue. So we made our plans for Sunday, September 15, and wrote Messrs. David Maholin, of Hartford; Shelton Sturges, of New Haven, and Stanley Kellogg, of Bridgeport, Conn., all Excelsior riders, telling them we would appreciate it greatly if they would be on the lookout for us five or ten miles north of their respective cities and pilot us through. We had no fear of losing the road in the open country, but were not so sure about the big cities. Some of these gentlemen met us and others deputized friends; all were kind and courteous. They helped us to gasoline and oil and refreshments and sent us through with despatch, and our appreciation of their assistance is as keen today as it was then.

Four a. m., from Boston! "Will we get up or stay up?" asked Monroe. We got up—with the aid of a trusty, if rusty, alarm clock—and in his room I heard him saying, "the cold gray dawn of the morning after is not the time for mirth and laughter." I called out to him that the "morning after" wasn't due for twenty-four hours yet. It was three o'clock. A steaming hot breakfast lifted our courage to the point where a San Francisco schedule would not have scared us, and we were ready for the road.

An Auspicious Start.

The car was well laden. An extra shoe was strapped on the back; two tubes, a package of small parts, a lunch box and an extra raincoat reposed in the front of the body. The clocks were preparing to strike four. Adieu said, we climbed aboard. I buttoned up the new storm curtain. "A kick and a clutch" and we slipped down Boylston street, past the Public Gardens and into Commonwealth avenue. The speed was 15-16 an hour, and this held until we passed the Packard Boston plant, three miles out, when it moved up to twenty. Commonwealth is a "saw tooth" road, and there are twelve miles of it. It is good in spots, but other stretches are full of

chuck-holes that try the outfit, motor and side-car, as well as rider's patience, to the limit. But the needle moved up and up, and, shades of Paul Revere! on the stretches through Auburndale and Naurembega it occasionally touches thirty-five.

Thus it is that we roll across the stone-arch bridge over the historic Charles River, twelve miles out, and when I tell Monroe that we are seven minutes ahead of the time called for on the card in my hand there is a grin on his face as he opens up and goes at the opposite hill with a roar that shows the first dash has done nothing more than warm the Excelsior up to its day's work. Weston, fifteen miles, with its green hills topped with Italian villas looking like fortresses in the gray light, slips to the rear, and we head down the Wayland road, a broad, smooth course that yields us forty an hour and then some on the straights. The car rides like velvet. "Rip" sits low to his work, watchful of milk wagons coming from lanes and by-roads and with an ear tuned for untoward sounds. South Sudbury, twenty miles; Longfellow's "Way-side Inn," twenty-one miles; and Marlboro, twenty-eight miles, are passed without incident other than the interest in the constant gain on the schedule, and at thirty-nine miles out we find ourselves fifteen minutes to the good.

Gaining on the Schedule.

So it was through Northboro, up the five hills into Shrewsbury, down the mile and a quarter hill to Lake Quinsigamond (these long Indian names before breakfast are good for the digestion), up the "Lake Hill" and into Worcester. Here William Farrell, of old road-racing fame, met us at City Hall with hot coffee and a bite; likewise gasoline and oil. *We were twenty-five minutes to the good!* Forty-five and a half miles in an hour and fifty minutes, and part of that ridden in the dark. I got out and stamped my tootsies, drank coffee and tried to look unconcerned. At this minute two autos full of friends rolled up. They had promised to see us through and down to Springfield and were greatly surprised at our early arrival, having planned breakfasting at a nearby "a la cart" (do you get it?) before we appeared, but they ate not. Ten minutes up and we were away again, with the clocks striking six as we flew out Main street, through Cherry Valley and to Leicester. Leicester Hill? Don't speak of it; it is unspeakable. It is the only teaser of a climb between Boston and New York. It is steep and rough, full of rocks, holes, dips, bumps and everything mean. It was slow work and Monroe walked the last hundred feet. I stayed

aboard, however, and in the glorious roads beyond, Leicester was soon forgotten.

Through Spencer and West Brookfield and the country between, the road wound among the green verdured New England hills, past rippling brooks and blue lakes shining in the early morning sun. We sped along the level stretches at from twenty-five to thirty-five miles an hour and climbed the hills at about twenty, taking it easily through the towns and giving the early risers a chance to read the banners with which we had the car decorated.

On a Scenic Route.

In West Brookfield we had our only tire trouble, a nice little blow-out, and as we had time to our credit, Monroe took fifteen minutes to make the change and then we were off again. Clocks in the towers of Warren and Palmer told us that we were still ahead of our schedule so we took it easily, drifting through North Wilbraham and into Springfield at 9 o'clock. Turning to the left at the foot of the State street hill, we found ourselves on the Hartford road, which runs down the East side of the river and this saved traveling through the streets of Springfield and allowed us to keep right up to the schedule. This stretch of road for twenty-six miles to Hartford was one of the prettiest, from a scenic point of view, on the entire trip. The banks of the Connecticut are lined with willows and occasionally a launch, off for a day's excursion, was seen flashing intermittently beyond the green. Monroe, however, had eyes for the road alone and was driving at a grand rate and paid little attention to anything but his work.

Through Longmeadow (100 miles) and Thompsonville (103), Warehouse Point (115) and into Hartford (122), at 10.30, showed us that the journey was more than half accomplished, with riders and Excelsior and Majestic De Luxe all in prime condition. Mr. Maholin, of the Hartford Motorcycle Club, met us at the big bridge across the river and showed us every possible attention. Time was precious, however, and we soon pushed on through Tracy and Wallingford, where the roads were none too good. We reached New Haven (160 miles), at 12 o'clock, seventeen minutes ahead of our schedule. Our escort here unfortunately had a blow-out, but under the circumstances was of quite some assistance. The policemen in the town, celebrated for harboring Yale College, were quite strict and slowed us down at every crossing. We lost our way once or twice and when one loses his way he usually loses his temper at the same time. So it was with us. We wandered into Fairfield ten minutes behind

our schedule and did not make it up until we reached Norwalk (191 miles), after which the going was better, so that we found ourselves in Greenwich, the last town in Connecticut, at 2.38, just on schedule time.

On the Final Stretch.

Then to Port Chester (207 miles), Rye (209), and we began to run into the worst roads on the trip. They were worn out macadam, full of chuck-holes and ruts, and to add to our discomfort the automobiles were as thick as they would be in a country town on parade day. Sometimes three or four would leave the main road in a procession for some other highway and one of these strings of cars we followed and so became lost again. At this time we were fifteen minutes ahead of our schedule and approaching the New York City limits. Another automobile overtaking us and noting the banner on our car, inquired if we had driven from Boston and if we were on our way to New York. I replied in the affirmative, whereupon they informed us that we were a considerable distance from the main road and offered to pilot us in. Certainly no kinder act could have been performed at that time, and we accepted with hearts full of gratitude as time was drawing short and our nerves were keyed up for the finish.

This good Samaritan proved to be C. W. Tate, of the Case Automobile Co., 1006 Broadway, New York, to whom we wish again to express our heartfelt thanks. He acted as pacemaker for us directly to Columbus Circle, at 59th Street and 8th Avenue, to which point we were followed by a party of motorcycle riders who had "hooked on" at different points in the last ten miles. Thus we believe we put up a record which will prove of interest to all practical motorcyclists; Boston to New York with motorcycle and side-car in daylight, and with time to spare. Monroe's weight is 165 pounds, mine 123 pounds. The Majestic side-car and extra equipment weighed about 100 pounds.

The schedule and route called for 240 miles, but through detours the distance covered amounted to 248 miles. With not a moment lost for repairs either to the Majestic or Excelsior and a fine day's sport, we finished up with a feeling that there is a substantiability to motorcycling and side-carrying, understood and appreciated only by those who have tried it out to the limit, as we think we did that Sunday.

The Full Schedule.

Due to Arrive	Towns	Total miles

	New York	24 240

CHICAGO MACHINE STOLEN.

A 1912 twin Excelsior was recently taken from the residence of Edward Matts, 723 West Sixtieth street, Chicago, Ill. The motor number is 36231, state license number 4905. The machine is equipped with a Simplex spring tandem attachment, Old Sol head-light and Perfecto tail lamp; aluminum chain-guard and tool-box on tank. A bull-dog head was fastened on the front mud-guard. Address communications to the Angsten-Koch Company, 348 W. Garfield Blvd., Chicago.

A CORRECTED ADDRESS.

IN the last issue the address of the Angel City M. C., of Los Angeles, was incorrectly given as 433 Fifteenth street. This proves to be the headquarters of the Oakland Motorcycle Club and the address of the Angel City squad is 132 West Twelfth street, Los Angeles.

A PRODIGIOUS SIDECAR RIDE.

BRITISH cycling can claim the longest-distance champion of the world in Harry Long, who, after riding gigantic distances on a pushbike in previous years rode to the Triumph works early in 1911, bought a stock roadster, and rode it 40,000 miles before last Christmas came around. This year he has gone one better by covering 20,000 miles with a 4 h. Singer and sidecar easily inside six months. Of course, only the distance is checked, his stops, repairs, and replacements being a private affair of his own, but the mere piling up of such a mileage is no small feat, especially when I add that he hugs the coast roads, which are notorious for hills and bad surface. On this sidecar jaunt he has covered every inch of the nearest practicable roads to the sea all the way round Great Britain and Ireland. His little daughter occupied the sidecar, which is the first of a new "underslung" type, with its chair depending by springs below the axle. Harry got through without breaking a valve, and he has several tips worth hearing on the point of saving the valves. He always inserts a new valve for 100 miles or so as an inlet valve, to get it acclimatized to heat, as he calls it, before transferring it to the exhaust tappet. (Note: Almost all British engines have interchangeable inlet and exhaust valves.—Ed.) He always shuts the throttle to slow down, in preference to raising the valve-lifter. His machine has a two-speed countershaft gearbox, of the sliding dog type, and is unique in that the drive from the engine to the gearbox is via an enclosed shaft, the final drive being by chain. Perhaps the most informative item of his ride is the excellent behavior of the Wood-Milne tires; Harry employs the heaviest covers that money can buy, and keeps them pumped iron-tight.

Scenes along the route taken by Miss Ripley and her brother in Boston-New York trip which was completed in a day.

From PORTLAND to PORTLAND

FOLLOWING is the final installment of the article written by Joseph P. Shantin, to describe his motorcycle trip from Portland, Oregon, to Portland, Maine. It carries the rider from Duncan, Arizona, to his destination, which he reached in fair time with colors flying. He is now on his way back to Oregon.

After traveling from Duncan, Arizona, to a point 10 miles east of Lordsburg, New Mexico, on June 28, I experienced magneto trouble, due to a short-circuit from water. When the water dried out I rode on, only to experience another short-circuit a few miles down the road. As it was getting dark and threatening rain I hustled back to Lordsburg for the night. The following day I rode to El Paso, Texas, 138 miles. The roads were bad most of the way, and I rode the railroad ties from Lanark on. In El Paso I looked up the Merkel agency and had my broken seat-bar brazed. I remained in El Paso over Sunday, June 30, and on July 1 proceeded to Glencoe, New Mexico, 168 miles.

I took along an extra can of gasoline that morning, but lost it and then returned and purchased a half-gallon can over which I kept better watch. I had bad roads and sand to Alamogordo, and then better going to Glencoe. Forging a creek four times helped to break the monotony.

July 2, to Roswell (84.0 miles). I had rocky hills most of the distance and had to ford one creek. I remained in Roswell that afternoon, taking a little ride with W. C. Bucy, Merkel agent there. The run on July 3 took me to Bronco, Texas (95.5 miles). There was a heavy thunder storm the previous night and I struck several miles of muddy road which made traveling difficult. I also had about ten miles of bad sand to go through. Fifty miles from Roswell I struck the high-water mark for gasoline, the price being fifty cents per gallon.

Surprising the Natives

On July 4 I reached Plainview. I lost the small wheel off my speedometer at Brownfield and found out that traveling was very inconvenient without it. Four of the towns on the route had big Fourth of July celebrations, and it was amusing to see how many people had never examined a motorcycle before. My machine seemed to fascinate them. I had

intended to stay in Plainview over night but all the hotels were full and I tried to reach the next small town. This I was unable to do, and I was obliged to pass the night in a farm house.

On July 5 I rode to Dumas. Traveling was bad for a time and then I had better roads. On July 6 I reached Liberal, Kansas, and on the following day I proceeded to Dodge City. I had five miles of sand and then had to ford a small river. There were a few good roads but most of them were rough from just being dried out after the rain. I arrived in Dodge City shortly after noon, and remained overnight waiting for mail.

July 8, to Ogden (about 275 miles). I got an early start and had fairly good roads. I broke my record that day as I covered about 275 miles, according to the road maps. I ran out of gasoline and had to push the machine a mile to a farmhouse where they kept an auto. There I got off the Santa Fe trail and went north through Clafin, Ellsworth and Salina. July 9; to Kansas City, Mo. (about 150 miles). Good roads, with a few exceptions. I took my time, stopping at the Merkel agencies in Topeka, Lawrence and Kansas City. There I received my first mail since leaving Phoenix, Ariz.

An Emergency Belt Repair.

On July 10 I stopped over in Kansas City with friends, and the next day I continued to Marshall, about 95 miles. On July 12 I rode to a point seven miles east of Wentzville (about 167 miles). I had rough, and in some places, muddy roads.

July 13, to St. Louis, Mo., about 45 miles. I had not traveled far in the morning when my belt broke and I had a little difficulty in getting it to hold with wire. After this I reached St. Louis without further trouble. As

I did not care to take any chances I put on a new tire as soon as I reached St. Louis, one of the old ones being in very bad shape. I made the necessary repairs on my speedometer, and remained in the city over Sunday and Monday.

July 16, St. Louis to Teutolis, Ill. (114 miles). The roads were good, except in two places, one between Troy and St. Jacobs, where I had to go through quite a little water and mud, and the other when I took the wrong road near Altamont, getting into about ten miles of very rough and muddy riding.

July 17, to Terre Haute, Ind., 70 miles. I had muddy roads to Greenup and when I reached there it commenced to rain, so had to lay over for four hours. I left about 1 p. m. and had muddy roads. At times the water was too deep to get through and I had to make long detours. Finally I got into a stretch of sticky clay, where it was impossible to make progress, and I was about to turn back to get on the tracks, when a good-natured farmer came along and offered to give me a lift. I accepted his offer, loaded the machine into his wagon and rode for a mile and a half.

July 18, to Richmond (138.1 miles). I had good roads all the way. I put in new rebound springs in forks and stopped for a short time at the Merkel agency in Indianapolis, also at the plant of the United States Tire Co.

Visit to Merkel Factory.

The next day I reached Columbus, Ohio (113.1 miles), over good roads and except for running a nail through my rear tire, I had no trouble. On arriving in Columbus I looked up Mr. Edwards, the Merkel agent, and Secretary Gibson, of the F. A. M. While there I attended the Merkel gathering at the convention and went to see the races at the motordrome. I stayed in Columbus over July 20, and got under way about 11 a. m. on July 21, with a number of Merkel riders who were going to visit the factory at Middletown. We left after a heavy shower and the roads were very slippery. A few miles east of Springfield I broke one of my control wires, which I was unable to fix, so I had to work the throttle in order to continue. After leaving Springfield I was separated from the rest of the party and did not reach Middletown that

"Many of the natives had never before seen a motorcycle."

night. I was out early the next morning and by 7 a. m. had reached Middletown. I visited the Merkel factory and was shown the processes of manufacturing a motorcycle and had my machine completely overhauled. I stayed over the next day and received generous treatment at the hands of the Miami Cycle and Manufacturing Company.

Slow Progress on Poor Roads.

I did not leave Middletown until July 27. I found good going to Chillicothe and rode a short distance by moonlight. On Sunday (July 28) I covered 113 miles over muddy roads, and had considerable trouble with my magneto. I crossed the Ohio River at Parkersburg and continued on to Murphysville. I had not gone far the next day when I broke the main saddle bar on my machine, which made riding uncomfortable. I was delayed four hours on account of rain and then the roads were slippery again. I was able to make only sixty-five miles that day and remained at Salem till morning. The following day I passed through a section which had been heavily flooded; the roads were all washed out, and in addition I had several creeks to ford. My magneto gave more trouble and I ran out of gasoline and had to walk over three miles to the next town. I stayed at Rowelsburg that night and the proprietor of the hotel, who owned an automobile told me how to remedy my magneto trouble.

On account of rain I did not get away till late the next morning and had poor roads all day. I left my camera at the hotel at Rowelsburg and sent word back to have it shipped ahead. On August 1 I left Capon Bridge, where I had stayed overnight and although the roads were hilly they were good and I made fair time to Gettysburg. I spent a few hours viewing the battlefield and the next morning I left for Washington, D. C. I stayed over in Washington sight-seeing, and made the acquaintance of A. W. Lafferty, Congressman from my home town.

In Portland at Last.

I met a couple of riders who were going my way as far as Philadelphia, so I left with them on the afternoon of the fourth. At Elkton I left my companions and continued on to Wilmington, where I stayed over night. I set out for Newark, N. J., the following morning, passing through Philadelphia and Trenton. At Trenton I met A. Karekus, the Greek who is traveling around the world on a Flying Merkel. I reached New York the following afternoon, August 7.

I left for Hartford, Conn., at noon on August 14 and found good roads except through the cities. When I was ready to leave the next morning I met an Indian rider from Wilmington who was going to Haverhill, so I had company to Boston. We stopped at Springfield to visit the Hendee Manufacturing Company, and then went on through Westboro, where we visited the F. A. M. headquarters and met Dr. Gibson. During the day McCartney, the rider from Wilmington, decided to go to Portland with me so we planned to go from Boston by boat. However, on arriving in Boston we were informed that motorcycles must be crated and we therefore decided to continue on our machines. McCartney wanted to visit some friends so I went on to Somerville, where I remained over night. I arrived in Portland at 1.30 p. m. the next day. My total mileage from Portland, Oregon, to Portland, Maine, was 5,964 miles. I stayed in Portland only a few hours and then left on the return trip.

BLAZING MACKINAW TRAIL

BY MAX
BURKE

TALES of severe motorcycle tours are becoming pretty common these days, but I am convinced that a recent trip through the Mackinaw division in my State (Michigan) is far enough out of the ordinary to warrant a brief story. I entered upon the journey in something of a joking mood, agreeing to ride without tools or a tire pump, although my route lay through a country where motorcycles were practically unknown and where roads could only be guessed at. Some of my friends questioned my sincerity and that clinched my determination to go through with the undertaking. Accordingly, I pulled out of Detroit on my Emblem one Sunday recently, minus the aforementioned tools and pump, and headed for the Mackinaw country.

For thirty miles out of Detroit the roads were good; then I struck sand, clay, deep

down again. I spent five and a half hours in riding from Grayling to Standish, 52 miles, and when I finally reached Mackinaw City I felt like a Glidden pathfinder. No one knew me there, but I was given a hearty welcome just the same.

I remained at Mackinaw only a few hours, and then took up the return trip by a different route. It was longer than the out trip, and harder, if such a thing could be possible. When I reached the Saginaw "turnpike" I discovered a pile of apples and potatoes by the roadside where they had been dumped, presumably by a farmer whose wagon had broken down under the heavy going. Both farmer and wagon had disappeared, and as I wanted something to show for my journey I took a two-bushel sack of potatoes from the pile and strapped it between my saddle and the tandem seat on the Emblem. Then I placed a bushel of apples in my suitcase, taking out the clothing and tying it to the machine here and there. I left a note for the farmer, explaining the conditions and telling him to mail me a bill for the apples and potatoes, but as I have not heard from him I take it for granted that he did not go back after his load.

Carrying the Double Cargo.

When I got under way with my heavy extra load I was doubly hampered, and the terrible roads almost forced me to abandon my sack and suitcase at several points. However, I knew it would add greatly to my achievement if I succeeded in getting home with them, so I stuck out the fight. To recount all my experiences on that return trip would require a serial story, but I lived through it and pulled into Detroit after six days on the road.

I used eight and a half gallons of gasoline and five quarts of oil on the trip. This may sound like very light consumption, but it is a true statement as far as I am able to calculate. The photograph shows my mount with the sack of potatoes on the rear and the suitcase carrying the apples strapped on the handlebars. The banner covering the case bore this inscription: "From Detroit through the Mackinaw Division." I think it is also worthy of note that my machine is a single.

AN INSPECTOR'S MILEAGE.

J. M. JACKSON, an inspector of construction work for the Union Electric Light and Power Company of St. Louis, Mo., who makes his daily rounds on a motorcycle, says he rides from 9,000 to 12,000 miles a year.

FRED JOHNSON, of Angola, Ind., is making a tour of Ohio on his new twin Indian in company with Ivan Clem.

Max Burke, Who Toured Unknown Trails into the Mackinaw Division.

ruts and loose stones, and this was the kind of going I had for a distance of 342 miles. I gave up three days to this trip, riding until 8 o'clock each evening. In some places the roads were so bad that I walked and used my clutch to let the machine pull itself through. The towns were hardly worthy of the name, and the natives informed me that my motorcycle was the first to appear in this section. They looked upon it with awe.

Some Record-Breaking Grades.

From Pinconing to Standish, 102 miles, the roads were little more than trails. I had never visited these places previously, by any means of transportation, and knew nothing of the route save what I could learn from town to town. The hills over Mackinaw Division are steeper than any others I have seen, and after reaching the top in some cases it gave me a sudden scare to think of riding

HOW THREE TENNESSEANS *Saw* NIAGARA

GEORGE E. DRENT

DESIRING to spend my vacation in what I consider the only ideal manner, on a motorcycle tour, I succeeded in interesting Ben L. Brachy and Will E. Davis, of my home city (Nashville, Tenn.), and as none of us had ever been to Niagara Falls or over into Canada, we decided upon the Falls as our destination. We left Nashville on Friday, August 2, and had what might be termed a fair road until we struck Kentucky at a point near Franklin. From this place to Bowling Green, the roads were considerably worse and by the time we reached the latter place we were in fine fettle for a chicken dinner, which, fortunately, we were able to obtain.

Some Hard Traveling.

From Bowling Green to Louisville, we had no roads at all. They may have been highways many years back, but now they are simply streaks of clearing through a rolling country, covered by stones as big as your head. The natives, however, did not seem to consider these bad roads at all; in fact, they thought they were rather above the average. They may have been for heavy farm wagons, but certainly not for motorcycles. However, we reached Louisville without any casualties the first night, and the next day we went to Latonia, Ky. We stopped at Frankfort and visited the state Capitol, and found some mighty good 22-year old Bourbon whiskey, the latter being obtained at the Capitol Hotel, which some years ago was the scene of the famous Goebel shooting.

Visited Merkel Plant.

The third day we left Latonia about 9 a. m., and rode over to Cincinnati, Ohio, where we called to see Ferd. Stenger the Flying Merkel agent. Then we proceeded to Hamilton for dinner. Hamilton proved a very uninteresting town, despite the fact that it is the county seat of Butler County, so we didn't tarry there, but headed toward Middletown, the home of the Flying Merkel. We arrived there about 2.30 p. m., rode around the town for a while and then went out to the Merkel factory. As it was Sunday there was nobody on hand except the watchman, who entertained us until evening. Early the next morning we went out to the plant again, where we were accorded a hearty welcome.

Leaving Middletown, we went to Springfield. The roads from here were rather good except for the dust. We spent the night in Springfield and had splendid roads straight on in to Columbus. We did not stop long at the latter place, but pushed on to Sandusky, arriving there at 10:30 p. m. The next morning we set out for Cleveland, and here is where we had the worst roads in the whole trip. There is sand nearly a foot deep in some places, and each of us took a spill or two. When we got to within about 17 miles of Cleveland, the sand was almost impassable, but just when we were ready to give up in disgust we ran onto a fine brick road and forgot all about our previous troubles. From Cleveland on to Buffalo, then to Tonawanda we had splendid roads, but from Tonawanda to Niagara Falls, rain and mud were encountered. When we reached Niagara Falls, we rode around the great gorge on the American side and then went over to Canada. We spent one night and part of two days at

Niagara and decided that as we hadn't had enough vacation we would ride back. Accordingly we turned southward, going through Tonawanda, Buffalo and thence on through Westfield and Lake Chatauqua, and on to North East and Erie, Pa., retracing the road back to Cleveland through Springfield, Ohio. At Springfield, however, we made a detour through Indianapolis and then went straight down through the state to Louisville, Ky., and from there over the same roads home.

A Satisfactory Summary.

We arrived home Sunday, August 18, all feeling much better for the trip. I rode a 7 h. p. belt-drive Flying Merkel, as did Brachy, while Davis rode a 4 h. p. Harley-Davidson. The summary of our troubles and falls was as follows: I had three falls and two blow-outs, necessitating buying a new tire at Cleveland. Brachy had two falls and one blow-out, and was also forced to buy a new tire. He bought his in Indianapolis. Davis had two falls and no tire trouble whatsoever, although he did have a lot of trouble with his flat belt, particularly on some of the steep hills which we encountered.

CLEVELAND CLUB NOTES.

AT the last meeting of the Cleveland M. C., the General Publishing Company was awarded the sole right to publish the Cleveland M. C. Directory for 1912 and 1913. This little booklet gives the name, street address and make of machine and horsepower of all registered motorcyclists in Cleveland.

Probably no club in the country has had a more profitable year than the Cleveland M. C. The club has held but two race meets this season, from which it derived a revenue, but its financial condition is twice as good as that of a year ago.

A letter from the police department of Cleveland notifying the Cleveland M. C. that a rigid enforcement of the traffic ordinance is to be expected was received by the club as a warning recently.

THE newly organized Aberdeen (S. C.) Motorcycle Club recently made a run to Hecla, where the riders were guests of the Hecla Commercial Club.

Nashville Riders on Tour to Niagara Falls.

A RARE BIT OF KENTUCKY LANDSCAPE

INTERNATIONAL TOUR

DONALD
McKIE

Part
Five

IN the present instalment of his article covering the European tour of the Atlanta tourists, Donald McKie deals with roads and customs in Germany, Austria and Switzerland. He reports comparatively little trouble with customs officials and states that the highways of Germany could hardly be improved upon. Mr. McKie's next article will deal with a trip over the famous Simplon Pass in Switzerland.

Vienna is a very interesting city and we spent considerable time in sight-seeing here, after leaving our machines in an out-house of the hotel. The latter arrangement proved costly for some person broke every bit of glass on them, such as the lenses in the lamps and the dials of the speedometers. A horn bulb was also taken and the gasoline was drained out of one of the tanks. We were mighty sore, but could not locate the offenders. Two roads lead out of Vienna; one following the Danube, while the other goes more to the south. We decided to take the latter and had some difficulty in finding the road. Finally we struck it, but we had not gone far when it started to rain. As a result when we reached Melk we decided to stay over till morning.

The roads were still wet and in bad shape when we started out the following day, and we had to use care to avoid spilling. We reached Linz, another prosperous town on the Danube, about three o'clock and as it was raining again we remained there overnight. While we were held up we cleaned our machines, so as to be ready for the mountain climbing ahead of us. We got started about noon the next day and had fine roads and excellent scenery. The mountains of Tyrol, to the south, make a very picturesque outlook. There were some winding hills to climb, but with 7 h. machines we made quick work of them; even the motorcycle carrying double had no trouble. We continued without trouble to Salzburg, the last town we struck in Austria. It is entirely surrounded by mountains, many of them being snow-capped.

A few miles out of Salzburg we passed the Austrian customs office, without stopping. We had entered and left Austria without any license or triptyque and had not been interfered with. Later we came to the German customs office. Here we were stopped and asked to show our papers, and we promptly produced our steuerkarte. For a time the officials insisted that we deposit a certain amount for our machines, something over 300 marks, but after considerable arguing they stamped our cards and allowed us to go on. All motor-

cyclists contemplating a European trip will do well to make note of this and hold out against such demands.

On Good German Roads.

Immediately upon entering Germany, traveling becomes very good. For a number of miles the road follows the banks of a large lake, the name of which we were unable to learn. The automobiles on the continent go very fast and you must be continually on the watch to avoid accidents. The distance between Salzburg and Munich is seventy-six miles, with only a few small villages en route. There were only three hills of any size and

they were climbed without trouble. We remained in Munich for a couple of days. While there we visited the German Museum where we saw a motorcycle built in 1885, called the Daimler, and another, the Drierl, made in 1898. Both were very interesting mechanical specimens and as might be supposed they formed quite a contrast with our machines.

Leaving Munich is very easy, as the main road goes straight out, something unusual for a European route. We did not get under way until 5.30 p. m., and after riding 35 miles we stopped at Landberg. Here we had to pay twenty-five cents, or ten pfennig, to enter the city. It rained from the time we entered the city until the next day. In the morning we started out, despite the rain. We had good roads and the time passed quickly. About noon the rain ceased and we had pleasant riding. We passed Lindau, at the eastern end of a large lake, known as Boden See. Here one can see across to the Austrian shore and discern the Austrian Alps in the distance.

It was raining again when we left the next day, but after a time the storm passed and the roads dried very quickly. Our course lay around the Boden See for many miles, and a short distance beyond Singen we again encountered the German customs, where we had our cards stamped. Further on we came to the Swiss customs office. We handed the officials our Auto Cycle Union cards (English), but were informed that this association is not extended the touring privileges. Our many other credentials were ignored in like manner and we finally had to deposit 28 francs or \$5.60 as security on our machines, with the understanding that this would be returned to us upon our leaving the country.

Viewing Good Scenery.

Switzerland's reputation naturally leads one to believe mountains are to be encountered from the start, but such is not the case. We rode for many miles over excellent roads. In Shaffhasn we saw the famous Rhine. Its water is of a peculiar color, unlike any we had previously seen. A short distance from the town may be seen the Rhine Falls, and the tourist should not miss them. After leaving the falls we were riding along at a good clip, when we were stopped by a farmer. He wanted to see our German driving license. As he could not show any badge we were reluctant to show our cards, but finally found that we were on a short stretch of German soil. We were soon traveling in Switzerland again and the next town we came to was Eglisna. On entering we went down a long winding hill and again saw the Rhine. An

old fashioned wooden bridge spans the river at this point. A long hill on the other side of the river had to be climbed, so we forgot the scenery for the time being and continued our trip. We decided to spend the night at Buchloe, a town about fifteen miles from Zurich.

We had not ridden far the next morning when we heard the roar of a cannon. We soon found that this hub-bub was caused by the Swiss army, which was engaged in its annual war maneuvers. We spent about two hours watching the "battle" and then continued to Zurich, reaching there before noon. Zurich is located at the foot of the mountains on the edge of a large lake. After riding around the city for a while we decided to leave and had some good hills to climb.

In the Mountains at Last.

The distance between Zurich and Luzerne is about forty miles. The road runs between high mountains, and is good, but full of curves. Going into Luzerne we were surprised to see a monoplane, presumably an Antoinette, making an exhibition flight over the lake. Luzerne is noted for its beauty and is consequently a mecca for tourists. This has a tendency to make prices high, so after looking around for some time we left just before dark. We located for the night at an inn outside of the city.

We continued on our way the next morning, with mountains all around us, and occasionally we came to a water-fall. We had good going to Bern, another attractive city and then to Lausanne. The latter place is purely a tourists' resort. The only place worth mention before we reached Lausanne is Tribourg, featured by true Alpine scenic splendor. We also encountered a severe hill, right in the city, with the usual rough pavement. From Lausanne we followed the LacLamon to Vevey, the home of Peter's chocolate. We were now approaching the real mountains, but as the road is in the valley we had no bad hills to climb. Out of St. Maurice there are many striking sights to be seen. At Martigny one can take the electric cog road to Chamonix, in France. From there may be seen Mt. Blanc, the highest Alpine peak.

We crossed and recrossed the Rhone and finally reached Brigue, where the famous Simplon Pass starts. We were detained here by the gendarmes, and having no International pass, had to pay two francs, or forty cents. This amount was required for each machine to cross the pass. From this police station to the next is only a little more than twenty-five miles, yet the officials force you to take two hours and twenty minutes to make the run. In other words the speed limit is eighteen kilometers or less than twelve miles per hour. After getting the time stamped on our tickets and making a short stop at a

cafe we were ready to ascend the famous Simplon Pass.

(To be continued.)

NEW ERA RECEIVER NAMED.

DAYTON, Ohio, Oct. 1.—J. D. Platt, Jr. has been appointed receiver for the New Era Autocycle Company, of this city, on the application of its president, E. Frank Platt. Inability to make collections contributed to the firm's action. Despite the present announcement it is reported that the company's assets exceed its liabilities. Two notes given by J. D. Platt and secured by E. F. Platt are also said to have had a bearing on the application for a receiver. These notes are unpaid and overdue. Other notes given by the company aggregate \$45,000. These will become due soon. The chief assets of the company, according to the petition for receivership, consist of the plant and its equipment. E. F. Platt asks that the notes endorsed be paid and to this end he wants the visible assets converted into cash, and the stockholders to share. The capital stock of the company is \$300,000 paid up. E. F. Platt was made president a short time ago. The receiver's bond was fixed at \$10,000.

BUFFUM'S CONTRADICTION.

EDWARD BUFFUM, of the Hendee Manufacturing Company's sales staff, announces that there is absolutely no foundation for the report, given credence in some quarters, that he is to leave the Wigwam to accept the position of sales manager for the Reading Standard Company, recently left open by the resignation of W. F. Remppis. Mr. Buffum disclaims all knowledge of the source of the announcement.

MR. AND MRS. THOMAS F. STONE, of Madison, Ill., recently completed a 2,000-mile honeymoon trip on a motorcycle.

PHILADELPHIA BANQUET.

BY way of celebrating the winning of prizes in the sealed-time run from Philadelphia to Stone Harbor, N. J., and in the races held the next day on the beach, the Harley-Davidson Motorcycle Club, of Philadelphia, recently

gave a banquet and smoker. A large crowd attended and it was unanimously declared a big success. Among the prizes won was a large silver cup, the club trophy; while six smaller silver cups, a gold watch and five stick pins constituted the winnings of individual riders.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

AN IMPROVED OUTFIT.

A VARIETY of devices go to make up this improved model of a touring motorcycle. The motor is a 9 h. twin, with combination drive (belt and chain), and a two-speed gear is fitted on the countershaft. The rear wheel is spring-suspended, having a rocker pivoted to the rear fork and the spring-members in each rear stay. The frame is in one piece, and contains the gasoline and oil tanks, tool-box and muffler. The saddle is mounted very low and has a spring post. Footboards are fitted and there are no pedals. The handlebars are cross-braced and the front fork operates on the same principle as the rear wheel suspension device. The change-gear lever is on the right and the clutch is operated by the foot-pedal on the footboard. The mudguards are of special shape and the brake is of the contracting band type. Handle starting for the motor is used. The compression relief device is operated by a rod on the left footboard. Contributed by H. D. Rhoads, Akron, Ohio.

A WORTHY IDEA.

MURRY FAHNESTOCK, of Allegheny, Pa., offers the following tip for manufacturers: "As there are many places on a motorcycle it is necessary to use left-hand threads to prevent parts from working loose it would be well to have such parts marked with an 'L,' or better still to have an arrow stamped on the part to show the direction in which the nut of bolt must be turned. This may seem like a small matter, but it gives much trouble to riders and even experienced repair men, especially where there are two lock rings, turning in opposite directions."

REAR WHEEL SUSPENSION.

TO a lug at the rear of the seat is fitted a coach-type spring, whose scroll end fits over a pin carried by the upper ends of vertical forks. To the axle is attached on each side the ends of horizontal fork members, which are pivoted to a special bracket near the base of the seat tube. The motion is

rocking around the latter bracket, while the vertical forks oscillate forward and backward, as the wheel rises and falls. Contributed by William Lindholm, Newark, N. J.

GRIP CONTROL LATCHES.

SOMETHING more definite than an uncertain amount of accidental friction to keep grip controls would seem desirable. The fatigue would be lessened by some form of latch, and three are suggested. A shows the first; there is a notched collar fitted to the handle bar and the grip sleeve carries a piano wire pointer in a lug. There is a set-screw for fastening the pointer in position. To change the position of the grip, the pointer can be lifted out of the notch or slid back, the grip turned and the pointer allowed to snap into the new notch. B has a radically-notched collar and a pedal-lever on the sleeve; the lever is held into the notch by a coil spring. To change position of the grip, the button on the end of lever is pressed, releasing the lever end from the notch. When the new position is reached the release of the button enables the spring to set the lever into the new notch. C is a modification of A, there being a coil in the wire pointer to give it springiness. It is

MURRY FAHNESTOCK.

brazed to the sleeve at the grip end. Either A or C will serve as indicators in addition to acting as latches. Contributed by Murry Fahnestock, Allegheny, Pa.

PROTECTED FOOTBOARD.

TO protect the feet of the rider an aluminum strip about three inches deep should be placed on the side of the foot rest as shown, with a curved dash or flap at the front. This would keep the shoe clean and also prevent the foot from bouncing off on negotiating bumps, etc. Contributed by Murry Fahnestock, Allegheny, Pa.

Rear Wheel Springs.

Variable Speed Pulleys.

EMERGENCY TANK.

TIPS AND TOPICS.

EVERYBODY has his troubles in this world, and the poor motorcycle dealer is not the least afflicted. When he isn't being bothered with unreasonable requests for free repairs, long after the guarantee period has expired, he has to explain that the effects of a bad case of "tinkeritis" nullify any guarantee whatsoever, and then soothe the lacerated feelings of the rider who has altered his machine for the worse. These are two of the reasons why gray hairs are so prevalent in the trade.

A dealer cannot please everybody, even with the variety of machines now on the market, and good evidences of this are the abnormal number of cases of "tinkeritis" and the letters that come to me about making various changes in existing machines, usually toward getting more speed. The "tinkers" go ahead with the work after hearing about some other fellow revamping his motor, or work along original lines and are generally dissatisfied with the result. The others, if they follow the advice given, attain the end desired (where that is possible), but at the cost of short life of the motor and increased expense. The advice of all technical men in both cases is: Make no structural changes in the machine. The manufacturers are wiser and more experienced, and usually do not put out a device that is unsatisfactory if treated properly. As to changes in the control systems, there is no harm done in making them unless they radically affect the operation of the motor, etc.

CARE OF BELT FASTENER.

BELT fasteners are inexpensive and comparatively easy of attachment under normal conditions, but even these advantages should not be looked upon by the careful motorcyclist as excuses for totally ignoring the uncomplaining little accessory. If the average fastener is not kept well oiled rust will set in quickly and necessitate an early replacement. Ordinary oil soon works off, however, and for that reason a lump of vaseline should be used. This will serve as a lubricant and also protect the fastener from rust. The rider who has been called upon to replace a fastener on the road, possibly in a downpour of rain, may realize that the connection has given way before its time, but even then the rust problem may not suggest itself to him. The use of vaseline on this fitting is one of the apparently unimportant little wrinkles that gives big returns.

PLAN BOWLING LEAGUE.

COLUMBUS, O., Sept. 24.—With the approach of cool weather, the members of the Columbus Motorcycle Club are getting ready for a busy season on the bowling alleys. The members will organize several teams representing their favorite machines, and a contest lasting through the winter months will be started for the championship of the club. Last year there were five teams in the race, the Indian team annexing first place, with the Harley-Davidson team a close second.

D. R. MACCOY, vice-president of the Joliet (Ill.) M. C., although nearly fourscore years of age, is an ardent motorcyclist and may be seen daily riding his machine.

AN EFFORT is being made by the Joliet (Ill.) M. C. to raise funds to properly mark roads within a radius of twenty miles of the city.

RESERVE GASOLINE TANK.

AN emergency gasoline tank is shown as a compartment in the regular tank construction. A partition divides the gasoline compartment into two, A being the emergency tank and B the regular tank. In A is fitted a needle valve and seat D, operated by a knurled handle on the stem. E is the regular needle (feed) valve and G the piping to the carburetor, while C is the oil tank. For ordinary running valve D is kept closed, and when tank B is drained, valve D is opened, when the contents of A run into B and pass to the carburetor. Contributed by J. S. Coyle, New Bedford, Mass.

SPECIAL MANUAL WANTED.

THE makers of a motorcycle should send out with each machine a manual in book form, explaining in the most simple manner the construction of the particular machine

which it accompanies. The manual should include adjustments, have illustrations, and particularly drawings and diagrams of the valves showing the setting. The carburetor should be more fully dealt with and instructions telling how to take down and reassemble the motor, how to clean it and finally how to test it out, should be included. Contributed by E. L. B., Blank, Pa.

A WOMAN SPEEDSTER.

MRS. HARRY SLAVINS, of Bay City, Mich., recently competed in motorcycle races at a fair. While she did not win a place in the finals, it is admitted that she showed class in piloting her Yale around the track.

In the British army motorcycles are now being used for scouting, in place of the cavalry.

QUESTIONS and ANSWERS

ANSWERS to Question No. 5, viz.—“Suggest means for improving the typical control system,” indicated strongly a desire for simplification of the operations performed by each hand, with the valve lifter separately operated, instead of being linked up to the spark control. One reply in particular was most ingenious, but the scheme is too intricate for the average rider, although considerable economy could be obtained if the arrangement was adopted. The first prize is awarded to Murry Fahnestock, of Allegheny, Pa., while the second award goes to B. A. Waltz, 1921 Ford Building, Detroit, Mich.

A number of answers to Question No. 6 have already been received. In general, the answers in this department have shown that riders are taking increasing interest in contests which involve thorough knowledge of the motorcycle and its parts. Answers to Question No. 6 will be printed in the October 17 issue.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the second issue following the number in which each question is asked. For example, answers to question Number 7, published in the present issue, will be printed in the October 31 issue. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time, the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of *MOTORCYCLE ILLUSTRATED* are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: “Editor Questions and Answers, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York.”

Question No. 6. What is the best way to remove and replace piston rings?

Question No. 7. Explain the operation of the inlet and exhaust valves.

FRANK

MERRITT

STANDARDIZATION OF CONTROL.

By Murry Fahnestock.

VIGOROUS efforts are being made by the Society of Automobile Engineers to standardize the control systems of automobiles, and it would seem a relatively easy matter to standardize the far simpler control of motorcycles. This would make it easier for the motorcyclist who has ridden one machine to become familiar with the handling of a new machine when he buys one. It would also tend to reduce accidents due to unfamiliarity in handling a strange system of control, for it requires time and much practice to become so familiar with a control system that the right thing is done instinctively and without hesitation. All control motions should be instinctive.

The second vital requisite is that the machine should be under complete control without removing the hands from the handlebars. Riders who have ridden over sandy or muddy roads will agree as to the importance to be attached to this feature, as it is no joke to have to take one hand from the bar to throw out the clutch when the machine begins to skid. Of course, all engineering is a compromise and absolute perfection an impossibility; so that it may be necessary to control the clutch by a lever at the left side of the gasoline tank, in order to secure the range and delicacy of control so essential to the proper operation of the clutch. The general adoption of this location shows that it has already been approved by the majority of

motorcycle manufacturers, so we shall take it as the starting point of our control system.

Safety a Prime Requisite.

The next point to be decided upon is whether the clutch lever shall be thrown forward or back to engage the clutch. It is important to remember that on such a high-speed vehicle as the motorcycle provision for quick and sure stopping is of the utmost importance if safety is to be considered. It is also one of the first points that is observed by the prospective purchaser. To stop quickly it is necessary to throw out the clutch, and since it is an instinctive motion to pull back the clutch lever when a collision is imminent, then pulling back the lever should disengage the clutch. An example of this practice is found in the fact that all automobiles have the emergency brake so arranged that pulling the lever backward stops the car.

Having placed the clutch lever at the left of the gasoline tank, the logical location for the throttle control is the right-hand grip, so that the throttle may be opened as the clutch is engaged, thus making possible a smooth quick get-away, without racing or stalling the motor. The importance of this is best recognized when going slowly through city traffic where it is necessary to throw the clutch out frequently and the noise of a racing motor is objectionable.

Spark in Left Grip.

If an emergency lever is thought desirable

it should be placed under the right-hand grip, so that the right hand can apply the brake while the left hand releases the clutch, when a sudden stop is imperative. The left-hand grip is the logical place for the spark control, since the general adoption of the magneto has made it practically unnecessary to manipulate the spark under ordinary conditions of riding. This is because the greater intensity of the spark at high speeds from the magneto, ignites the charge more quickly and thus less spark advance is required.

If the compression release is incorporated with the spark control, it makes the control simpler, which is a great advantage for the inexperienced rider; but if a separate release is thought desirable, and no emergency brake is fitted, then the place for the compression release is under the right-hand grip, for it will often be used as a brake. If an emergency brake is fitted, the compression release will necessarily be placed under the left-hand grip. If a magneto cut-out is furnished, it should be placed adjacent to the right-hand grip, for it is only used when stopping the motor or using the engine as a brake in descending long, steep hills, for example.

Control Elements.

One way of fitting the emergency brake is to attach it to the clutch-lever in such a way that after releasing the clutch, the continued movement of the lever applies the brake. Of course, the throttle could also be interconnected in such a manner that throwing out the clutch would slow down the engine and

thus prevent racing of the motor; but this would make it difficult to start the machine from a standstill in heavy sand or mud as it would be impossible to speed up the engine before throwing in the clutch, unless some special means were provided for temporarily throwing the connecting device out of action.

One feature of the average control that is generally unsatisfactory is play or lost motion, due to wear in the joints of the control system. The fewer the joints, the less play there will be, and in this respect the Bowden wire control would seem to have an advantage over the universal joint and sliding sleeve system. This looseness becomes increasingly evident after the machine has been in use for some time, and sometimes manifests itself in erratic running of the motor. At any rate, it makes the control uncertain, particularly at low speeds, and often results in stalling the motor when one merely wishes to slow down in traffic.

Applying the Remedy.

The best thing to do is to tighten up all joints, inserting new washers and bushings where necessary; but it is often possible to attach a light coil spring to the throttle lever of the carbureter in such a manner that the spring has a constant tendency to pull the lever either open or closed. Thus the spring will take up all the looseness in one direction, and one may operate the grip control feeling assured that the carbureter will respond accurately and not plus or minus an uncertain amount of play. The spring should not be strong or stiff, or the throttle will not remain in the position in which it is set.

SECOND PRIZE WINNER.

FROM B. A. Waltz, of Detroit, Mich., comes the following answer. It is excellent, except, perhaps, the linking up of the spark and gas could not be trusted to most riders since an independent adjustment also is mentioned. It is given second prize for its general excellence.

"1. A magneto cut-out consisting of a spring mounted on the binding post usually provided with magnetos for grounding the primary circuit, said spring to be in contact with the frame of the machine when the magneto is giving the greatest retard of spark.

"2. Connection of usual spark control to the throttle control in such a way that for openings of the throttle for speeds up to 20 miles per hour there will be a corresponding spark, varying between retarded and advanced position. Provided, however, that there may be means for retarding spark if desired with any other opening of throttle, greater than that necessary for speed mentioned.

"3. Provision of a graduated control for the clutch by lever on handles, as an improvement upon the present crude grip control or tank lever, which demands loss of hold on grips at times when a firm hold is necessary.

"4. Provision for an auxiliary handle bar control of the brake, for use in emergency when feet are not upon pedals.

"5. Provision of a reducing motion in the throttle control mechanism to allow more delicate adjustment of the throttle.

To Malcolm Bedell, of 26 James street, Montclair, N. J., is awarded honorable mention. The accelerator device mentioned is novel, but might not appeal to the majority of riders. His answer follows:

"The typical motorcycle control is by the double grip system, one grip controlling the

gas or throttle and the other the spark and valve lifter. If the spark is operated by a small lever directly over the grip that works the valve lifter, it can be set in starting at the position where it offers the least resistance. The lifter can then be operated without disturbing the spark setting. A clutch lever under one grip and a spark lever under the other will also add greatly to the comfort of the rider. An accelerator under one grip to open the throttle and operated by pulling back with the first finger may also appeal to some users."

Harry L. Dearborn, of Hillsboro, N. H., is also awarded honorable mention. He writes as follows:

"Fit the throttle grips and exhaust valve lift on the right bar with the spark advance and free engine clutch on the left; this will enable the spark to be set and the engine accelerated quickly with the least movement of the hands when starting off, for example. It will enable a stop to be made with spark and throttle set ready in traffic. Most riders can steer better with the right hand than with the left."

ROLLO CYCLECAR.

WALTER DOYLE—The Rollo cycle car is made by the Rollo Car Co., Ltd., Conybere street, Birmingham, England. Its price in England is from \$484.50 to \$510, according to the fittings (wind shield, top, etc.). There are no American agents, so write to the above address.

FIRING SEQUENCE.

A. DELARONDE.—Firing sequences on twin motors are figured from the rear cylinder as No. 1, and are given in terms of degrees on the crank path, although the carbon brushes on the magneto are set 180 degrees apart. The majority of twins have the cylinder axes set at 45 degrees apart and the firing sequence is 0-405-315. The last figure is the angular distance in degrees between No. 2 cylinder and No. 1. It will be noticed that the sum of the angles is equal to 720 degrees, or two revolutions. The Indian has cylinders set at 42 degrees, and the sequence is 0-402-318. The English-built Premier has the cylinders set at 45 degrees, but owing to an eccentric connecting-rod arrangement, the firing sequence is the same as the 90-degrees twin, given below.

The Thor has the cylinders at 50 degrees, with the sequence 0-410-310, while the M.M. twin-cylinders are 90 degrees apart and fire at 0-450-270. The relative balances of the various angles is treated in an article on "Balancing the Motorcycle Motor," March to May, 1911, of this publication.

BRIDGEPORT BOATS.

L. HERING.—The boats between Bridgeport and Port Jefferson, L. I., run at 9 a. m. and 6 p. m., on week days only during October. There are no boats running on Sundays.

N. S. U. TWO-SPEED.

H. F. LEE.—Apply to the Sun Motor and Supply Co., 307 Amsterdam avenue, New York, for details of the N. S. U. two-speed gear. They are the American agents for all N. S. U. material.

CLARENCE WEBB, of the Roanoke (Va.) Cycle Company and Joseph Kizer recently made a trip on their motorcycles to Washington and Baltimore.

PORTS IN CYLINDERS.

ALF. FREIDLEIN.—Form the ports beginning at $\frac{3}{8}$ of an inch before the piston reaches the downward dead center and shape them so that they will be all uncovered when the dead center is reached. Use a port area equal to the area of the exhaust valve. Use a $\frac{3}{8}$ drill and have the ports about $\frac{1}{2}$ to $\frac{3}{4}$ of an inch apart. We cannot give you the exact dimensions, as you do not tell us the size nor make of the cylinder you purpose porting. As to the advantage of porting a so-called "eight-valve" motor, it is very slight, and should not be necessary if the valve areas are properly calculated.

For timing the valves of a racing motor, apply to the makers of the motor. Generally speaking, the exhaust valves open earlier than on a stock motor. On a ported motor, start the exhaust to open as the piston uncovers the ports. We cannot give you further details until we know to what motor you refer.

Shrinkages are calculated for in the wood patterns, so that the casting would be the proper size with the proper shrinkage allowance. We advise your consulting a foundryman, or text-books on founding and pattern-making.

As the Brighton Beach and Vailsburg motor-dromes hold meets under F. A. M. sanction, no motors over 61 cubic inches capacity are allowed to compete. There are no restrictions as to air-valves, etc.

SIDECAR INFORMATION.

J. E. DONALDSON.—(1) A sidecar will operate well on poor roads if care is taken in the steering and if speed is not attempted. On hills, if the power is sufficient and the gearing the proper one, there should be no difficulty in making ascents. That is, unless they are unusually steep, in which case the passenger will have to walk. The passenger on a sidecar acts as ballast as well as passenger and should assist the outfit if necessary.

(2) Six horsepower, or still better, seven is sufficient for general sidecar work over other than smooth going.

(3) The latter form of drive is preferable, but the majority of European sidecar machines use the V-belt. It is really a question of what you can get out of the motor. We have ridden a six motor with sidecar in hilly country and never had trouble with the V-belt fitted.

TO CAPE COD AND THE COAST.

HARRY DETTER.—From Northbridge go to Farnumville, then to Saundersville, Millbury and Worcester; then go to Shrewsbury, Northboro, Marlboro, South Sudbury, Wayland, Weston, Waltham, and Cambridge to Boston. This route is the reverse of our route number 10 (Spring Touring Number). From Boston take our route number 9 to Provincetown, via: Milton Lower Mills, Quincy, Hingham, Cohasset, Marshfield, Plymouth, Sagamore, Sandwich, West Barnstable, Barnstable, Cummaquid, Yarmouthport, Yarmouth, Dennis, Brewster, Orleans, Eastham, North Eastham, South Wellfleet, the Truros, and Provincetown. Cape Cod is readily reached from the latter town. To get to Martha's Vineyard, turn off at West Barnstable and go to Marston's Mills, Mashpee, East Falmouth, Falmouth, and Woods Hole. From the Hole get boat (New Bedford to Oak Bluffs) to Oak Bluffs. Return via New Bedford, and ride through Westport Factory, Fall

River, Warren, Barrington Station, East Providence and Providence. At the latter city, go north to Pawtucket, then to Ashton, Woonsocket, Blackstone (Mass.), Uxbridge and Whitins to Northbridge.

STORAGE BATTERIES.

H. C. GREENWOOD.—Write the Electro-lamp Battery and Ignition Company, 67 Atwater street, Detroit, Mich. We do not think that any firm has a special make for any particular motorcycle. Small storage batteries are perfectly practicable for ordinary use; for years this type of ignition source was the only one employed on European motorcycles.

FITTING A CLUTCH.

JACOB P. DALL.—An Eclipse clutch can be fitted to the 1910 model machine you mention, and so can an Indian clutch. Write the makers or communicate with the nearest agent for the respective products, specifying the model and serial number of the machine.

DE LUXE MOTORCYCLE.

A. J. W.—The maker of the De Luxe motorcycle is the Excelsior Cycle Co., 166-8 Sangamon street, Chicago, Ill. The motors are made by the F. W. Spacke Machine Co., Indianapolis, Ind.

WATCH THE FILLER CAPS.

WHILE little trouble is experienced on American machines with leaky or unstable filler caps, too much importance cannot be attached to the proper fitting of these seemingly negligible parts. Many riders—not all of them in the novice class, by any means—are prone to give the cap a careless twist or two after replenishing the gasoline supply and thus leave an opportunity for the fuel to slop out, flow over the tank and drip down on the motor. With the machine in this condition a single backfire in the carburetor may start a costly blaze. The time devoted to screwing the filler cap in carefully and snugly is always well spent.

The same rider who handles his filler cap carelessly is likely to disregard a small leak in one of the seams of his tank, and thus seek trouble again in the form of a fire. With the gasoline sloshing about in the tank it does not require much of a leak to ooze out considerable fuel, and a comparatively small quantity may cause trouble. Some machines have a habit of developing a small leak where the tank is strapped to the bottom bar, but once this is repaired it is not likely to cause further annoyance. At any rate the original outlay for a repair is insignificant compared with the expense incident to even a small blaze.

PISTON PATTERN.

J. W. BRAUER.—From your sketch we conclude that you want the piston for a 2 15/16-inch cylinder, as it would be too small for a 3-inch one. The pattern for the piston is shown at B (see illustration); it is 3.031 inches long and cylindrical, with a diameter of 2.936 inches. The dimensions allow for shrinkage. The core prints, shown in black, are cylindrical also; the side prints are 1 1/2 by 3/8 inches, while the base print is 1 inch deep by 2.700 inches in diameter. The core will look like the shaded part of A the dimensions being given. The outline represents the core box, and there should be two of these with the edges registering so that the core will

serve to make the desired hollow inside the piston. It may be necessary to reinforce the side arms of the core with wires to prevent their breaking away.

The pattern B is cut in half. Make up the drag and use one of the B pattern halves, and then do the same with the cope, using the other half. Build up the cores in the boxes and bake them. When ready remove the B patterns from the drag and cope. Place the baked core so that the side arms fit into the spaces left by the side core prints of B and that the base section (below the dotted line in B) fits into the base print space. Brace by a light iron rod if necessary. Put drag and cope together and the mould is ready. For directions as to pouring hole vents, see some treatise on casting or some foundryman. When the piston is cool, its cross-section will be that shown at C. After scraping off the sand inside and out the piston will be ready for machining to the required form. Note that there are holes for the wrist-pin cored out, for making the machining easier. We have left the interior form of the piston to you to decide on, other than that given.

PROF. ROBERT GOODRICH, of the University of Arizona recently completed a motorcycle trip through the southern part of his state. He covered a distance of 500 miles and took 18 dozen pictures while en route. He rode a twin Indian and experienced no trouble on widely varying roads.

NEW MUFFLER BUILT ON NOVEL LINES

Invention of Texan Embodies Principle of the Maxim Firearm Silencer and is Credited With Unusual Efficiency.

SILENCE and a minimum of back pressure are the prime qualifications of a muffler for motorcycle use, and that this is realized by inventors and designers is readily perceived by a glance over the patent reports and the columns of the trade journals. Some ideas stand out from the general run of designs, and one of these is here illustrated. It is embodied in an invention patented by L. C. Smoot, of Hillsboro, Texas. To those familiar with progress in firearms manufacture, the similarity to the well-known Maxim silencer will be at once apparent, but certain details of construction have been made the subject of a patent.

The muffler consists of a series of spirals of pressed steel, placed in a cylinder body so that the cylindrical portions communicate with each other. These spirals are made with a hump in the center, but this is cut away in all but the next to last. The cutting away of these humps forms a channel practically the length of the chamber, but the sharp edges around the cuts allow a portion of the exhaust gases to pass successively into the cylindrical portions just mentioned and thus make their exit through the last spiral. The muffler is fastened to the exhaust pipe by the straight tube shown, while the outlet is through the curved casting at the opposite end. The action is as follows:

The exhaust passing into the muffler through the large openings in the spirals has portions deflected by striking the sharp edges and the gases thus separated from the main stream are given a rotative motion and pass out thus through the outlet. The main stream strikes the hump of the uncut spiral section and is

deflected into that spiral and joins the whirling stream, making its exit along with the latter. Its superior velocity draws the whirling stream along faster. The shape of the hump is such that back pressure is reduced to the minimum as the stream is deflected on striking it. The breaking up of the stream successively reduces the noise of the exhaust, and thus the prime requisites of the muffler are fulfilled.

A MOTORCYCLE LOCK.

IN the accompanying illustration is shown a new motorcycle lock, for which the California Motorcycle Company, of 818 South Main street, Los Angeles, is about to take out a patent. The principal claim for this lock over other similar devices is that it is a permanent attachment. It is fastened by means of a clamp on either the front or rear fork of a motorcycle. The cross-arm 15 is hung on a swivel so that it may be swung down between the spokes of the wheel, engaging in the clamp 14 on the opposite side of the fork. The combination lock shown at 20 locks the cross-arm in position and when the arm is down all the screws on the clamp are covered. When the cross bar is swung out of engagement it stands up parallel to the fork and is locked in position by a spring, 26. This makes it impossible for the arm to spring back between the spokes while the machine is in motion. The lock will be manufactured in two styles, one having a small padlock and key and the other the combination lock.

JOHN JAMIE and Louis Bornegrebe, of Aurora, Ill., covered 400 miles on a recent run to Danville.

ONTARIO RIDER ON SKIDDING THEORIES

Cobalt Enthusiast Supports C. A. Shaw in Belief That Front Wheel Slips Cause Motorcyclists Most Trouble on Greasy Roads.

FROM Cobalt, Ontario, comes the following letter in support of the anti-skidding theories advanced recently by C. A. Shaw, of Groton, Mass. It is written by O. L. Holmes, who has had considerable experience as a motorcyclist and whose opinions are therefore interesting. Mr. Holmes writes as follows:

"Murry Fahnestock's letter to MOTORCYCLE ILLUSTRATED, attacking the theories of Mr. Shaw with reference to skidding, prompts me to offer a few arguments supporting the claims of the latter. I admit the soundness of all Mr. Fahnestock has to say concerning rear-wheel skidding, but his statement that automobiles are never equipped with front-wheel chains is wrong, because the four-wheelers are often so fitted for service on muddy roads, particularly in clay districts. The chains are fitted on rear wheels principally to give traction for forward movement. If there are no chains on the rear wheels they will spin in soft going and by lifting up the rear of the car cause a skid. The power plant weight being over the front wheels helps to hold them to the road, and for this reason chains are not needed as badly here as in the rear. Any automobile driver who has driven over a narrow, steeply-crowned clay road in wet weather knows that chains or non-skid devices do not eliminate side-slip or skidding. So much for the automobile side of the question.

"As regards the motorcycle tandem, no two riders on earth have such sympathetic harmony of movement as to take the same action at the same instant by way of preventing a skid. One or the other will overdo the balancing act. Naturally, no tandem seat places the weight between the wheels and the tendency is to lighten the grip of the front wheel on the road and place most of the responsibility upon the rear wheel, which, because of the added weight, is not so likely to skid.

"In other words, I believe that when front-wheel skids are guarded against the machine

can be driven over almost any kind of a road with safety. I have found that in cutting corners on a half-mile dirt track with a smooth rear tire and a Nobby tire on the front wheel I can get greater speed by five miles than when the tires are reversed and the smooth one is on the front wheel. This ought to prove something.

"As to the relative value of singles and twins for slippery going I would say that the former have a considerable lead. If the single is not overgeared it will often make headway in greasy clay where a twin would get into serious trouble and flounder all over the road. Recent endurance performances in this country and also in the British Isles bear out my claims. In summing up I would say that the distribution of weight on the machine, the fork design, center of gravity and alignment of the wheels have much to do with skidding and that the saddle position and shape of the handlebars also figure."

SHAW STANDS HIS GROUND.

C. A. SHAW, of Groton, Mass., whose skidding theories were discussed in a recent article in MOTORCYCLE ILLUSTRATED by Murry Fahnestock, of Allegheny, Pa., submits the following brief statement with reference to his arguments:

"I was much interested in Mr. Fahnestock's article on skidding which appeared in the columns of MOTORCYCLE ILLUSTRATED. His reasoning is ingenious, but whether I can disprove his theories or not does not bother me. Why? Because the proof of the pudding is in the eating. My riding in the last three months has been restricted to the demands of business; still I have covered well over 2,000 miles, 600 of which were on the narrow clay roads of Maine. Beyond one skid of my rear wheel in a clayey mire, which did not result in a spill, I had absolutely no skidding and not a single fall. What's more, I did a lot of riding over wet roads.

"My rear tire, having covered 3,000 miles, is quite smooth, but the knobs on my front tire show very little wear and it still grips the road wonderfully. If Mr. Fahnestock or any other reader wishes to test the value of my idea it is easily done. Select some day when the roads are greasy after a rain. Ride five miles with a smooth front tire, and then place an anti-skid tire on the front wheel or some anti-skid bands on this tire and cover another five miles. If you find no improvement in traveling with the front tire thus safeguarded against skidding, then there is nothing in my idea. But I know you will note a difference."

MORE ABOUT SKIDDING.

FROM a road veteran: "Perhaps some riders skid on front wheels and others have the rear wheel habit. My few skids have been of the rear wheel variety, and I have noticed several times that when the front wheel starts on a skid and the rear wheel refuses to follow suit, the machine—mine, anyhow—always straightens up and goes on about its business. From my limited skidding experiences—I am usually a very careful rider—I have found that a rear wheel skid means a stop for a few minutes to straighten a bent crank or something; a front wheel skid means an anxious one hundredth of a second; after all, if the machine gets a proper start on a skid there is no time to figure out the theories and angles. In an instant the machine is on its side and the only thing the rider can do is shut off the power if the motor is still running; then stand the mount up, straighten the handlebars, take that dent out of the horn, see what caused the skid if possible and profit by the experience."

"RED INDIAN."

SKIPPED BAD ROADS.

EDWARD WHEELER, of Paducah, Ky., journeyed to Louisville by train recently and from there he rode to Buffalo, N. Y., on his motorcycle. He explains that he could not ride his machine to Louisville on account of the bad condition of the Kentucky roads.

PAUL VOGEL and Maurice Wilson of Omaha, Neb., are en route on a tandem motorcycle jaunt to New York.

NOT long ago the writer, while working himself into the good graces of a new machine, climbed a certain hill on an uncertain road in northern New Jersey and upon taking a sharp turn almost bowled over a brother of the trail who was standing beside his mount. We stopped, and as the distress signals were quite evident inquiries were in order. The story was soon told.

The offending machine, almost brand new, should have taken the hill without a whimper, but it had failed to top the grade in two attempts. The owner was not only tired; he was disgusted. Being the type of roadster who swears by his mount, he was irked at finding it not up to his calculations. Then came a council of war. It developed that the rider had started to climb the hill under a fairly good head of gas and that upon the first hint of a "knock" he had considerably retarded his spark. The writer suggested that this might have been overdone, and another trial of the new machine proved that injudicious handling of the spark accounted for most of the trouble. The owner went his way with renewed faith in his mount.

It is not possible to lay down a hard and fast set of rules for hill-climbing, applicable to every machine, but it is well to remember that in starting to climb a grade, unless it is a short one which can be rushed, the engine should be given the minimum of gas and the spark kept advanced for a time. Assuming that the carbureter is properly adjusted, the air supply should not require alteration unless the rider has purposely been running on a weak mixture. When the motor feels the load it is time to increase the gas supply gradually and to keep a sharp ear open for the "knock" which indicates that the spark must be retarded slightly. Many riders fail to get the most out of their machines in hill-climbing because the motor is not given its additional gas at the instant that it is most needed, and because the spark is too far retarded at a critical time. Any shock, however slight, to the momentum of a machine on a hill is bound to prove costly.

A Handy Sidecar Wrinkle.

USERS of sidecars who employ a loose cushioned seat in their passenger attachments are often troubled by having the cushion work out of its position over bumpy roads and slide down to the foot of the "basket," when the latter is being driven empty, but a simple contrivance recently noted will obviate this irksome habit. An ordinary strap and buckle is riveted to the sidecar seat and when the cushion is placed in position the strap is fastened—a matter of a moment—and the cushion will not be dislodged over the roughest roads. When spares are carried under the seat of the sidecar it is doubly annoying to have the cushion bumped

out of place, as the spares are quite likely to follow and give the rider an unpleasant time collecting them. Even when the "basket" carries a passenger the buckle and strap render service by keeping the upholstered seat just where it belongs in rough going.

Speed at Expense of Strength.

I DON'T think the desire for abnormal speed is very common, but almost every rider wants to be able to hit up a good clip in a roadside brush and come off first. To get a little extra speed, a rider can use cams of different profile from the ones ordinarily fitted, lighten the pistons and connecting rods, and cut ports in the cylinders, but he does this at the expense of the life of the motor, and the failure generally comes surprisingly quick. But these matters require considerable calculation and knowledge of a high technical character, and a greenhorn rider attempting them would simply spoil the outfit completely. Only the other day such a case came up, and the experimenter will be obliged to buy practically a new motor.

He was a pretty weighty rider, and was tired of being passed on the road by machines of the same power, so he obtained exhaust cams from another very fast machine of a different make, fitted them and cut ports as were in the motor from which he got the cams. It took about eight hours of hard work to get a satisfactory running of the bus, but it certainly did move; wouldn't go less than twenty miles an hour with the spark fully advanced. On most of the brushes along the road he "cleaned up," but was finally defeated in a match on one of the dirt tracks with a member of his club. During the race his motor quit entirely, and on taking it down this is what we saw: Long vertical scores in the cylinders, due to sand entering the ports; a broken piston and cylinder-head, with one of the exhaust valves embedded in it, and the crankshaft bearings gone. The cams were so sharp that the exhaust valve had its head literally hammered off and the nickel steel head punched through the piston and stuck inside the head finally. The sand entering the ports "fixed up" the bearings. You can imagine the repair bill he faced. As the machine had not been in use more than three weeks, he demanded repairs under the guarantee, but didn't get them. Now he is a bitter enemy of the maker and dealer, simply because he had a bad case of the tinkering disease and couldn't get the dealer to pay for his experiments. Moral: Don't tamper with the machine unnecessarily.

If, gentle reader, you are such a rider as L— you are not the dealer's best customer, nor his worst. L— buys a new machine each season, takes it apart, verifies every fitting, lightens very slightly each piston, assembles it and retimes the motor. If the

present model of carbureter does not give as good economy as that of last year, the latter goes on the machine. The result is that after going through this operation, L— has a very economical bus, one that is speedy and a strong hill-climber. His second-hand mounts sell for the highest prices in the neighborhood. But riders of this type are all too rare nowadays.

Flabby Mixtures.

ANOTHER "tinkeritis" case was also costly, but in a slightly different direction. This party, whose trouble could have been remedied by a change of one tooth in the valve-gearing, concluded that he was not getting enough gasoline, and proceeded to enlarge the jet aperture. He did not get enough air, so fitted a little Tucker grease cup in his manifold, and lo! the mixture was good and the motor ran quite well. But after going eighty miles the tank was nearly bone dry; he retimed the valves and did about ten miles per tank better than before. This summer the trouble began, as he went to a hilly district for the holidays and had to run slowly a good part of the time. The net results were a big fuel and oil bill and a motor whose cylinders were furred with carbon. He was running on a "flabby" mixture; one that had the proper proportions of gasoline and air at high speeds, but in which there was too much gasoline for the power developed. A part of the gasoline was merely burned without doing work, and was thrown out of the muffler uselessly. The jet aperture was too large. On low speeds too much fuel was used also, otherwise the mixture would have been too lean to give power with the enlarged jet opening. More riders run on flabby mixtures than one would think, and there are several ways of finding out whether the mixture is flabby or not. One is to ride on a given amount of gasoline and note the mileage, doing this a number of times and noting at what setting of the needle-valve the motor pulls strongly and how the most mileage is obtained.

Who Wants This Change-Speeder?

IN these days when every thoughtful motorcyclist is giving careful consideration to variable gear developments it is interesting to note the ingenious but sometimes far-fetched designs by which foreign manufacturers strive to obtain the desired results. In this connection it is probable that a certain French builder has something of a lead on all competitors. He is marketing a two-speed gear which, in order to run on low, requires that the rider pedal backwards!

The device is made up as follows: There are two chain rings placed side by side, one larger than the other, according to the ratio of gears required. Then on a bracket depending from the chain stay there is a small

chain wheel in the form of a jockey. The chain leaves the sprocket, goes round the smaller chain ring, round the jockey wheel, over the larger chain ring—from bottom to top—and leaving it at the top takes a downward course (inside the stay) to the bottom of the sprocket. The result obtained by this complicated arrangement is that the rider gets the direct normal drive when he pedals in the ordinary way. The pull from the top of the sprocket rotates the smaller chain ring and the rest of the chain's journey is merely by way of returning.

When he desires to use the low gear the rider pedals *backward* and the pull then comes from the bottom of the sprocket and so rotates the larger chain ring. In this way it obtains an increase of power, but a smaller number of revolutions for each turn of the cranks. As far as the mechanical operation of the device is concerned it has given the result intended, but that any American motorcyclist could put up with a contrivance which required his back-pedaling to obtain a low gear is hardly within the bounds of imagination. The Parisian inventor's gear, by the way, has been shown at several French motor shows, but it is not reported that it has worked up any interest worthy the name.

The Combination Drive.

SINCE a Triumph machine, using the combined chain and belt drive, romped off with the Junior Tourist Trophy on the Isle of Man a short time ago American designers as well as those in the front rank of English manufacturers have been giving this transmission system its full share of consideration. That the combined drive has its marked advantages cannot be denied. It gives a short, high-speed chain drive to a countershaft, thus enabling the user to employ a larger "small" pulley for the belt drive. The belt drive as a result becomes more durable and there is less likelihood of belt slip. British riders of the combined drive machines assert that they make good on all the claims advanced for them.

In use the combined drive adds one hundred per cent to the life of the belt, according to authoritative reports. The chain is given the first and most severe part of the driving stresses to transmit, while the belt escapes with comparatively light strains. Even under these conditions the much-abused chain outwears the belt and gives less trouble. This brings into court once more the old case—chain vs. belt—which it is not the purpose of these paragraphs to dispose of. However, the combined drive is rapidly making friends among the Britishers, and that it is worthy of all the attention it has attracted appears to be borne out by the tests.

Progress in Army Tests.

OF late I have noticed frequent references in the English motorcycle press to the important part being played by the motor two-wheeler in manoeuvres of the British army, and it is evident that American advocates of the motorcycle as a military adjunct may pick up many a tip from the warriors of Cousin Jonathan. The situation takes pertinence from the fact that motorcycles were used to excellent effect during the recent "siege" of New York, when the Red and Blue armies carried out their remarkable campaign to a draw. One of the generals engaged in the conflict stated, unhesitatingly, that he would have been sorely hampered without his mo-

torcycle scouts and messengers; that they had, in fact, permitted him to turn the tide at more than one point. As the campaign was naturally one of the keenest strategy, the motorcycle, skimming hither and thither at top speed and with minimum fuss and flurry, occupied a place of prime importance.

About 250 motorcyclists figured in the British army manoeuvres held during the present month. This staff was made up as follows: Twenty riders furnished by the A. C. U., the governing motorcycle body; 60 riders from the Automobile Association and Motorcycle Union; 40 from the Legion of Cyclists; 70 from the Territorial Cyclist Battalions; 20 furnished by the regular army; 15 from the Officers' Training Corps, and 30 from the special reserves and the Royal Engineers. In addition any motorcyclist who wished to participate could, by registering with the Legion of Cyclists, place himself in a position to be called upon for service.

The War Office allowed each motorcyclist a free railway pass for himself and his machine from his home to Cambridge and return. In addition an allowance of eight shillings a day was made to cover wear and tear on the motorcycle, charges for gasoline and oil and insurance. This was paid only when the riders were in service, and not during train journeys, etc. There was free mess for the motorcyclists while in camp and an allowance of eight shillings a day for hotel expenses while they were in service on the road.

KEROSENE AS FUEL.

GASOLINE prices have been noticeably fluctuating during the summer and early fall, and the tendency is generally toward a higher figure. Our British brethren are feeling this more than we as yet, the prices (which include a tax) being in the neighborhood of 40 cents per Imperial gallon, or at the rate of 32 cents per United States gallon, with prospects of a further increase in the near future. That any radical increase in price is not to be our portion we devoutly hope, but in the event of such being the case, it would be well to consider some other form of fuel, or a combination of gasoline and another fuel.

Of the fuels obtainable on a scale sufficient to satisfy the needs of the thousands of users of internal combustion motors, there are but two: kerosene and alcohol. The latter, in the form of denatured spirit, is very expensive,

costing in the neighborhood of 33 cents per gallon in barrel lots, and also would require, for the best economy, that the compression pressures be raised to as much as 100 or 120 pounds per square inch. This would involve an extensive redesigning of motors. Kerosene, on the other hand, is obtainable in gallon quantities at a very moderate price and can be used in motors constructed for gasoline fuel, without any redesigning of importance, if any at all. Difficulties lie in the proper vaporization of such a fuel, preheating being necessary for the purpose, or the mixture with air will be too rich and a wasteful odorous exhaust will be the result. A combination of gasoline and kerosene would seem to be the best under the circumstances, and it is toward the employment of this double-fuel that experiments have been conducted abroad.

One of the pioneers in this line of experiment is C. Binks, of Manchester, England, who has brought out a two-jet, two float-chamber carbureter for motorcycle service. One jet, the smaller, communicates with the gasoline compartment of the tank, and the other to a second compartment containing kerosene. On slightly opening the throttle, the gasoline jet is uncovered and this fuel is used for starting and slow running. As the throttle is further opened, the suction on the gasoline jet is decreased and the kerosene jet exposed, until the motor is running on a combination of kerosene and gasoline. This action precludes the necessity for preheating, as would be the case with kerosene only being used. The proportions of the tanks are 75 per cent. gasoline to 25 per cent. kerosene. Experiments along this or allied lines would be of inestimable value toward the attainment of economy in motorcycle operation.

MOTORCYCLIST BRINGS SUIT.

COLUMBUS, O., Sept. 23.—Daniel G. Vandermarck, of Groveport, O., has filed suit for \$469.50 damages against Charles Miller, of Canal Winchester. Vandermarck says his motorcycle skidded on a road south of the city and that Miller, who was driving an automobile, ran him down, smashing his machine and injuring him.

MUST HAVE LICENSE.

A LAW requiring all motorcyclists to carry a State license number went into effect September 9 in Kansas City, Mo., and State License Inspector Roach announces it will be rigidly enforced.

THREE CUBS IN THE RANKS.

THAT a baseball player may also be a full-fledged motorcycle enthusiast is evident from the accompanying photograph which shows Ritchie and Lavender, pitchers, and

Needham, catcher, all of the Chicago National League Club. The picture was taken at the Chicago grounds when the players consented to mount their machines in uniform for the benefit of the photographer.

The SUCCESSFUL DELIVERY VAN

ITS CONSTRUCTION AND OPERATION

D. R. HOBART

*Organizing a company—
Analysis of failures in the past—The problem from a territorial standpoint—
Different types of vehicles.*

ONE of the problems of the small retail merchant in a large city is to find the best method, from the viewpoints of economy and reliability, of delivering his packages. He has customers from all parts of the city, as a rule, although his main trade is in his immediate neighborhood. But if he specializes and has no branch stores, he is usually compelled to hire a boy and pay his carfare if the delivery is to be made quickly, or throw himself on the mercies of a local expressman, who charges in such cases all that the traffic will bear. Besides he is uncertain as to time of delivery.

Merchants who have tried boy-delivery know its unreliability and too-great expense, and in some cases they have adopted the carrier-bicycle. In using such a vehicle practically only time is saved; there is the purchase price, interest on investment, tires, etc., to be considered, and it is doubtful in the end if the gain is sufficient to warrant the increased expenditure. The bulk of goods a boy can carry in his hands and that capable of being carried on the bicycle is practically the same, so that given a certain number of packages per day, the cycle-mounted boy will deliver more than he who travels by street car.

This leaves the man who has goods to deliver with two alternatives, district messenger service or the delivery company. If the former, the reliability of delivery is pretty well assured, but the cost is often higher than when an employee makes the deliveries. There is practically no gain in time in either case. But if the services of a delivery company are available it is an entirely different question.

Defining a Delivery Company.

A delivery company undertakes for specified sums the delivery of parcels up to certain weights in a certain territory, using its own vehicles for the purpose. After handing over the packages to the company's driver or collector, the merchant need give no further thought to the matter; it is up to the company to do the rest. If there is any walking the floors at night over expenses, the company does the walking, and not the firm whose packages are being delivered. The company meets expenses and makes the profits solely on the income derived from handling the packages, consequently the strictest economy is necessary, not only in initial expenditures, but in all operating expenses, as rarely more than 15 cents can be charged for a package delivered within a city's limits. When the average operating and standing costs for a horse and

wagon figure at from 6.4 to 7.8 cents per mile, it will be seen that this form of hauling is out of the question for light parcels, so that some form of mechanical propulsion which is cheaper must be used. The commercial motorcycle, in the form of a tricar or side-van, presents itself as the most logical solution of the problem. In a former article (Commercial Motorcycle Costs), the writer showed that the average per mile for such a vehicle would be 3.82 cents, all expenses included.

Where Most Attempts Failed.

There have been quite a number of package delivery concerns started in the various large cities of the United States during the last five years, but most of them failed. As far as the retail merchant and his packages were concerned they were all successes; they delivered the goods, but the floor walking was performed in each case by the delivery concern's officials with too great frequency. The causes of non-success in the order of their importance were: incorrect estimate of costs, improper vehicles, configuration of the territory operated in, insufficient capital, and bad management.

Incorrect Cost Estimates.

From a number of interviews with officials of such concerns, it has been learned that the only standing costs figured were the rental of the building, washer's wages and salary list of the office force. Apparently the cars did not depreciate, there were no taxes figured on, no insurance costs (even when the insurance was written on the cars), and the interest of the money invested in cars was left to be slapped on the profit and loss account. As these costs popped up with astonishing vigor at the end of the year the inevitable happened, and the concerns passed out of existence quietly, except as regards the stockholders concerned. In two cases the writer was able to save concerns more than a substantial loss and enable them to keep going, but only to see them peter out later by defaulting officials.

Another prolific cause of incorrect cost estimates was the unfair attitude of the agents of the cars bought. Up to a year ago it used to be the usual thing to neglect everything but the gasoline, oil and tires in figuring costs, and the worst offenders were the automobile truck salesmen, whose victims danced to the tune of several thousand dollars each. The commercial motorcycle was an unknown quantity, and the buyer took the salesman's word in such matters, and found his expenses eating

up his income in consequence. Mention may be made of the salesman or distributor who disposed of some dozen machines to start a concern on such representation, got his money out of it, advertised the sale, etc. The "loading up" did its work; the concern went under disgracefully, and the territory was a barren field for motorcycle business of all kinds for several seasons.

Improper Vehicles.

Failures through improper vehicles are usually due to the adoption of "hybrids" instead of proper commercial cars. The chief hybrid was the high-speed twin with van attachment, commercially unsuitable for steady service by reason of its weakness, short life, increased first cost and great consumption of fuel and lubricant. In lesser degree comes the purely pleasure motorcycle with the van attached, short life being the chief cause of unsuitability. Finally, the fact that at one time only these two varieties of three-wheeler were available caused the construction of "special" vans, mostly along automobile lines. Wooden wheels, bevel or worm drives, sliding change-speed gears, pressed steel frames and big tires, increased the standing costs while not necessarily the operating expenses, and the net result was the same—failure.

Bodies were usually constructed to hold too much for the capacity of the power plant, and overloading resulted. For example, two ordinary books of octavo size weigh more than a pair of shoes boxed, and if a van body built for shoe carriage was packed with books, the springs would go in a short time. For parcel delivery either the classes of parcels must be restricted or the bodies must be of such size as to prevent overloading.

Territorial Configuration.

Not all cities are adaptable for economical motor delivery of any nature. By this is not meant the business or economic conditions, but the actual formation of the city and the nature of the paving. The taxicab companies have found this out to their cost; certain cities by their configuration never will permit of extensive revenue being realized. It costs just as much to run a vehicle empty as it does with a load, and the most economical conditions require that the vehicle run with load as large a percentage of the time as possible, for the delivering pays, while the running empty does not. This applies whether the "freight" is human or goods of any sort.

Take New York City, for example. It is spread over a long, relatively narrow island, with only one diagonal street—Broadway. Diagonal streets are of advantage to cities and towns, as they shorten total distances all over, but as they give more building surface they are usually crowded with local delivery traffic, which interferes with the through traffic striving to take advantage of the diagonal in place of the straight and cross-streets. New York is no exception to this and is handicapped by its lone Broadway. With even the most careful routing of the parcels to be delivered, the majority of New York hauls will have a good proportion of "empty" mileage. In other words, on account of the shape of the city, the deliveries will be made mostly to the north and south and the returns in the same direction. The diagonal street can only be availed of when the territory in which deliveries are to be made is adjacent to it. The distances being long, parcels will have to be relayed at uptown stations if the business warrants establishing such stations, or the hauls will be extra long and the "empty" mileage even greater.

Paving Conditions.

Another condition or set of conditions is the nature of the paving. In New York there are asphalt, cobbles, wood block, artificial stone block, Belgian block, macadam and dirt. By reason of poor management, the asphalt is generally set on a weak foundation and develops pot-holes and gutters. The cobbles are always badly set and the few macadam pavements are in poor shape. The various block surfaces are fine, but not sufficiently connected with each other to favor motor vehicles. As the pitted asphalt and cobble surfaces are mostly met going north and south, the vehicles give out sooner, and the depreciation increases, boosting the cost per mile. The only hill of importance in New York is the Washington Heights section, which can be reached by easy grades from the southernmost part.

In a city of the "circular" type, like St. Louis, delivery trips can generally be routed so that the empty car will be a short distance from the station when the last package has been delivered. A flat city with plenty of diagonal streets and one kind of pavement (say asphalt) maintained in good shape, is nearly ideal for motorcycle delivery purposes,

Other Causes.

The question of insufficient capital was primarily due to lack of business knowledge, but in part also to insufficient data on costs of the entire outfit necessary to conduct the business. Under the head of bad management comes too many or too few employees, too costly a plant and fixtures, poor soliciting of

business and, generally, an insufficient stock of cars and parts. All these can be avoided by consultation with proper authorities in the various lines.

Starting a Delivery Business.

The initial step in developing a delivery business is in the survey of the field, the determination of the volume of business obtainable and the prospects of increase of volume. This survey will determine approximately where a central location for the station or garage will be to give the prospective patrons prompt service. In the preliminary survey in approaching prospects it will have been necessary to fix prices for the parcels delivered, and there are several methods of charging for these. The best way is to charge according to district, with additional 5 or 10 cents for packages over certain sizes or weights. The latter condition should not be given much consideration unless the custom in heavy but small parcels warrants it.

District Charges.

In laying out a city in delivery districts, the one served directly from the station is known

as the "inside," and will vary in a radius according to the circumstances. Surrounding this will be the "middle," an approximately circular segment with nearly the same area as the "inside." Lastly, the "outside" district surrounds either wholly or partly the "middle" when the need for this district is apparent. In the accompanying drawing the city is shown laid off in the three districts, and the following tariff prevails:

	In-side.	Mid-dle.	Out-side.
Ordinary parcel (shoe box or of less size).....	05	10	15
Big parcel (hat box, suit of clothes)	10	15	20

Bigger parcels should not be carried; the smaller and more numerous the packages the

greater the returns, naturally. The inside district, or the "five-center" in this case, ends at a 2-mile radius from the station; the middle district's outer bounds are at 3½ miles, and the outer district's limits at 6½ miles. In the inner district, parcels are called for and delivered to any district at the tariff mentioned above, and this is arranged so for the middle district. In the outside district, if the business volume does not warrant the establishment of a relay, or branch station, an extra charge is made for calling, in addition to the regular charges for delivery.

Selecting the Car.

The next step is the selection of the car, as it will be called hereafter. The conditions to be considered are: Ability to negotiate all grades encountered and to carry the maximum load required, a fair turn of speed, ease of control, ready replacement of parts, ample tire equipment, and economical operation. Another and quite vital point, is that the frame should have no moving joints whatsoever, with the exception of a spring fork on the side-van model.

Ideal Not Yet Obtainable.

The ideal car has not yet arrived, but there are signs of its coming apparent. At present, for loads up to 500 pounds, the writer considers three types of great value for general delivery purposes. In the subjoined specifications only the general lines are given, details being left for the manufacturers or purchasers.

Type 1, side-van—5-horse-power, medium-speed, single cylinder motor, with friction clutch and two-speed gear (planetary or dog-clutch type); chain drive, reinforced standard frame, coaster and band brakes separately operated, 2¾-inch tires, magneto ignition, valve lifter operated by separate lever on bar and clutch controlled from bar or top tube. Side-van frame with front connection as shown, van body sprung all around, end or top doors, detachable hub, 2¾-inch tire. (See drawing.)

Type 2, tricar—same specifications as Type 1 except: Forecar attachment by side members to rear axle and by braces to steering head. Van body sprung fore and aft, front opening doors, 2¾-inch tires.

Type 3, tricar—5-horse-power medium-speed, water- or fan-cooled single cylinder motor under driver's seat, two speed planetary or friction change gear, chain-drive magneto ignition, two distinct brakes, channel or angle steel frame, hand and foot (car) control. Wire or tubular steel wheels, 2¾ or 3-inch tires, van body sprung fore and aft, with front doors. (See illustration.)

Reasons for the Selection.

Investigation of a large number of cases show that the 4 horse-power single motor as

Delivery Side-Van.

Delivery Tri-Car.

at present constructed is not well adapted to commercial service. It develops its power at too high a speed, overheating when run on a low gear for any length of time, and occasionally not developing power enough when run slowly. As commercial delivery service requires crawling along in traffic, steady climbs, and slow running over rough streets, a motor that develops its power at slower speeds than the single 4 is needed. As such a motor would be heavier than the 4, a medium-speed 5 h. single should fill the bill; it would develop sufficient power at slow speed to keep the machine going, could run slowly in traffic and on hills, and with a variable gear should go anywhere that the load will permit. A twin motor is out of the question, on account of the increased cost. Two speeds in the variable gear are all that are necessary, and as the machines mentioned will be marketed in the neighborhood of \$500, a planetary or dog-clutch gear can be fitted without excessive cost. A sliding gear would be too expensive, and the same applies to shaft drive.

Two distinct brakes should be on every machine fitted with an attachment of any nature, for safety's sake. Commercially speaking, the second brake may save damage suits in case of failure of the regular brake. The fact that the car has generally to be handled in traffic points to the need of a readily operated valve lifter, independent of spark or throttle, while the handle-bar clutch control keeps the driver's hand on the grips except when changing speed. The $2\frac{3}{4}$ -inch tires are none too big for a 300 to 500 pound live load, and it would be excellent to have the driving tires filled with Newmastic or a like substance instead of air.

The Carrier Type Tricar.

This is not strictly along motorcycle lines, but is a tricar or "carrier" following well-tried patterns. Owing to the large van box cutting off the air-draught, a fan, or water-cooling is advisable, the latter with its radiators being

shown. The motor and two-speed gear are mounted with the drive sprocket between them and a single chain direct to the tubular steel rear wheel transmits the power. One brake is incorporated in the gear, and the other, operated by hand lever, works on the rear wheel. The speeds are controlled by the short lever at the side of the seat.

Tubular steel wheels are lighter than wood wheels and resist shocks to a greater degree. Being welded together, the parts do not come loose as is the case with wire wheels, and the wheels remain true. Wheel steering is shown, but a tiller or side lever could be used as desired. A channel or angle steel frame is as cheap as a reinforced tubular one, and can be repaired by a good blacksmith, to whom a tubular frame can rarely be trusted. It can be bent hot or cold as desired, and involves no brazing.

Side-Van vs. Tricar.

In other delivery lines the question of side-van vs. tricar is in a large measure determined by the nature of the surfaces traversed. Over country roads, for example, the tricar is the better, causing less wear and tear on the machine and having the power to exert a direct push on the load. On city streets, unless absolutely vile, the greater strain put on the motorcycle by the sidecar may be considered to be somewhat counterbalanced by the greater ease in loading and unloading the van, as the box is right at the curb and accessible from top or side as desired, while the body on the tricar is open at the top or front only. Actually, the tricar and side-van appear to run equally well, and it is a matter of individual choice, if the latter is suspended properly from the motorcycle.

Sidecar Should Carry the Load.

To prevent distortion of the motorcycle frame, the load in the van body must be carried as far as possible by the sidecar wheel and frame, and towed by the motorcycle. This means that the load must be well over the

axle, and that the sidecar frame must be supported at the front to prevent the load leaning forward and dragging on the motorcycle. A tie-rod at the center of the front frame member and linked to the steering head will prevent this tipping forward.

(To be continued.)

OFF FOR THE COAST.

HUGH A. FARGO and Harrison H. Crawford, of Atlantic City, N. J., started on September 19, for San Francisco, Cal., by motorcycle. They have letters from Mayor Louis Fuhrmann, of Buffalo, and Mayor William Riddle, of Atlantic City, to Mayor James Rolph, Jr., of San Francisco.

It is not the desire of the young men to make a speed record. They will go through Philadelphia to Gettysburg, then south and over the mountains to Wheeling; thence through Columbus, Dayton, Indianapolis, St. Louis and Kansas City to Denver. From Denver to California the route will depend largely on the weather.

THAT NEW ORDINANCE.

THERE are indications that the recently framed ordinance to regulate the speed of motor vehicles in New York city will be acted upon by the Board of Aldermen at an early date, possibly before the middle of the current month. If this is the case the new measure will become operative about December 1, as it must be on file with the Secretary of State for thirty days before it goes into effect. It is expected that the new ordinance will be adopted without parley, despite the fact that some of its regulations are rather stringent. Speed limits are set very low and the penalties for violations will be heavy.

MAINE TO OHIO.

FOLLOWING is a brief description of a trip made by Harold N. Hanold, of Alfred, Me., on his motorcycle: The tour was to Marietta, Ohio, a distance of 1,200 miles, which Hanold made in just five days. He used exactly seventeen gallons of gasoline and had only one puncture. An hour's stop was made for each meal and there was no night riding. He rode a single Indian and states that the machine made every hill without trouble.

STRICT REGULATIONS.

AN ordinance prohibiting tank riding which was recently passed by the City Council of Kansas City, is being rigidly enforced and open mufflers within the city limits are absolutely forbidden. The police have also been instructed to stop all machines without headlights, which are required by the law.

BERKS CLUB RUN.

FIFTEEN members of the Berks Motorcycle Club with headquarters at No. 710 North Ninth street, Reading, Pa., made a run of 60 miles on Sunday, September 29. The riders left Reading at 8 o'clock in the morning and returned the same day.

FRANK BECK, of Joliet, Ill., has just taken the agency for the Indian motorcycle. He also represents the Harley-Davidson.

C. W. APPLEGARTH and C. D. Ferguson, of Lead, S. D., recently made a jaunt to Huron, same state, on their motorcycles to attend the State fair.

of Congress, March 3,
1879.

H. N. CONDUCT,
Secretary

FOR F. A. M. TOURISTS.

FEDERATION riders throughout the country will be interested in the announcement that on October 1 the F. A. M. Touring Bureau formally came into existence and took up its work of collecting and filing data relative to roads and general touring conditions. This is a progressive step which should give motorcyclists cause for rejoicing and at the same time arouse in them a widespread spirit of co-operation, for without the latter the task of building up a practical and systematic service for tourists would be doubly tedious and intricate. A number of state maps and considerable information bearing on main routes in the possession of the Touring Department of MOTORCYCLE ILLUSTRATED, are at once accessible to the Bureau and this arrangement permits of answering ordinary queries without further delay. The material thus available, however, is simply an encouraging nucleus for the fund of touring information which the Bureau hopes to have at its disposal in the course of a few months.

ACTING in the belief that something more than mere outlines of routes should be afforded its patrons, the Touring Bureau is now taking steps to obtain first-hand information concerning road conditions so that the prospective tourist may be instructed as to the character of highway surfaces he will encounter. It is obviously of prime importance that the rider shall know whether a given route is traversable only in fair weather or at certain seasons of the year, and it is through the possession of such intimate data that the Bureau will become in time the motorcyclist's most valuable ally. Tabulated statements on roadbeds under varying weather conditions will be collected, district by district and state by state, and renewed at intervals, and it is for the successful development of this plan that dealers and riders generally will be asked to give their generous co-operation. The task of gathering and filing this data will be a formidable one for the Bureau, but the work devolving upon the individual rider will be insignificant by comparison with the general results obtained for the advancement of the project.

IN view of the fact that the current month practically closes the touring season for the eastern and middle western states, the Bureau is giving specific attention first to the Pacific coast territory, and preliminary work has been taken up for obtaining the fullest possible information relative to routes and traveling conditions in California, Washing-

ton and Oregon, the immediate plans being designed to cover California. When all the desirable routes in this state have been outlined an official map will be prepared which may be sold to F. A. M. members at a nominal price, to assist in defraying the expenses of the Touring Bureau. The work will then be carried into other states, southward and eastward. While this system of state routing is being perfected the Bureau will proceed to answer queries and gather general touring data, without regard for state lines, and F. A. M. riders are invited to forward all available information, with special regard for road conditions, garages and hotel accommodations. Tell your touring story briefly, but fully, and mail it to the F. A. M. Touring Bureau, 51 Chambers street, New York City. The Bureau will appreciate this thoughtfulness and dozens of other riders will profit by it.

ROAD COURTESY.

IN almost every club you can hear the same story of riders being forced off the road by reckless motorcar drivers, and the condemnations made are only too just. Short of throwing something at the offender, there would seem to be no method of retaliation excepting legal proceedings, and while the vice on the part of drivers is too common near large centers, it fortunately is not on the increase. As a matter of fact, it is the

A HINT TO DEALERS.

BEYOND a doubt 1913 will be the biggest year so far in the history of the motorcycle industry. When the selling season opens an army of buyers will want machines—and want them quickly. To meet this unprecedented demand manufacturers are arranging for greatly increased outputs; in some cases production figures will be doubled. Are you ready to do your part, Mr. Dealer?

Sales will be rapid, competition keen. To make the most of your opportunities you will need to know the meaning of selling and service efficiency. Without it you will suffer lost motion. The National Motorcycle Dealers' Information Bureau helps dealers to turn every prospect into a sale. It gives them practical assistance in advertising and in obtaining general publicity. It gets results; it gives them moral backing—and it makes no charge. The address is 23 East Ohio street, Indianapolis, Ind. A post-card will start something. Mail it today. Merely state that you are a live dealer after live business and see what happens.

professional driver that does the mischief, and not the owner-driver, but "all drivers look alike" to many motorcyclists. I have in mind a case that happened not so long ago near New York where I was driving a car and, seeing a motorcyclist trying to pump up a 2¾-inch tire with a little frame-pump, I pulled up and offered the big, compound foot article carried on the car. The reply was pretty gruff, but I got down and pumped the tire myself to the proper gauge pressure. As I put the pump back under the seat the rider mounted, pedaled, put in his clutch and, kicking up the stand, went off—no thanks coming my way. Then came the inevitable "I told you so" from my passenger, and a discourse on the general actions of the motorcyclist. On comparing notes with the passenger, I found that he had been obliged to run up a bank on one trip to avoid cutting down a motorcyclist who dashed suddenly out on the wrong side at a corner, and then laughed at the fright of my friend's lady passenger. Hence the lack of love between the drivers of the two and four-wheeled vehicles.

THE lot of the reformer is a hard one, but I claim that if you treat all road users with consideration you will get it yourself. It takes all kinds of people to make a world, and the reckless driver of any vehicle will "get his" sooner or later, and you may be the agent by means of which the "come-uppance" arrives, without actually shooting or maiming him. It practically always pays to be polite. I say practically always, but some readers might not agree on this point if they had the following experience.

IN the early days of the two-wheeler, when lever control on the top tube was new and springless frames were universal, a party of riders was bowling along at about 20 miles per hour. As they passed around a turn in the road, a restive horse, driven by a lady, hove in sight, and the riders lifted their valves and stood up on their pedals. The rider nearest the horse back-pedaled with such vigor that the coaster brake locked, the machine stopped and he kept on through an arbor vitae hedge. As he staggered to his feet he heard the fair driver say sweetly: "Thank you," and then came the clump-clump-clump of the horse's hoofs. Question—Did he get thanked for eliminating himself so thoroughly, for his quick stop, or for his graceful dive?

ANOTHER rider met a forlorn young woman with a badly punctured bicycle tire, and stopping to offer assistance, was

asked to deliver an important note at the railroad station, five miles away, to a man whose description she gave. Ever gallant, the rider took the scented missive and scorched for the station to intercept the man described. He took a hard tumble at one turn, but remounted and sped on. Reaching the station and seeing his man, he explained the circumstances. The recipient thanked him and on opening the note showed unmistakable signs of cholera. The rider accordingly prepared for battle, but was only handed the note as the man boarded the train. It read as follows: "James, dear, don't forget Tootsie's collar."

AUTO RACING WANING?

INTEREST in the automobile race classics scheduled in Milwaukee this month is not as keen as had been anticipated, and the promoters of the big program admit it. Although there promises to be some interesting competition among cars of recognized worth, the fields in most instances will be comparatively small. American car manufacturers have, generally speaking, withdrawn their support from racing, and most of the glory, such as it is, will be gathered in by a few foreign cars.

The trend of things follows similar lines in the motorcycle field, and the disposition of manufacturers to keep their hands off is strengthened by pitiful occurrences such as the frightful accident in Newark recently.

There is pleasure, comfort and satisfaction in moderate speeds a la motor. The fascination is quite irresistible to the average man and woman. To most of us, too, there is something wonderfully attractive in the spectacle of drivers piloting the little or big speed demons at a space-annihilating rate. But the possibility of an accident is no doubt the biggest factor in making interesting the sight of a racer traveling at an eighty or ninety mile-an-hour clip. Plainly speaking, it's a barbaric thirst for blood that makes high speed so popular with the masses, and it's nothing short of madness for gold or excitement that permits of indulgence in the pastime at one's own risk.

Although most of us will be taught by nothing short of some terrible experience which

brings the truth to our very doors, the fact remains that excessively high speeds are a detriment to any sport, however delightful its exercise in moderation may be. The mile-a-minute road-burner may be always in our midst, but never in the wide world will he help to popularize the sport by his arrant abuse of it.

ACCIDENT PREVENTION.

COMPARATIVELY little is known, even in official circles, of the American Museum of Safety, and it is quite likely that this mention of the name conveys no concrete idea to nine out of ten readers, despite the fact that the institution is one which deserves at least the moral support of all road users. The museum is located in New York City, and has for its object the prevention of accidents and the general preservation of human and animal life. To this end special attention is given to traffic conditions, and simple rules of conduct for emergencies are worked out for adults as well as children. Mrs. William Tolman, wife of the director, has instituted classes which meet at the headquarters, 29 West Thirty-ninth street, and by means of models and diagrams she instructs the children as to correct and incorrect methods of crossing a street, and how otherwise to avoid trouble. That such instructions are of real value in the campaign to lower the percentage of street accidents cannot be denied.

AT present only New York children can be accommodated, as the means of the museum are limited and no fee is charged, but the authorities count upon extending their field to other cities at a comparatively early date. It is argued—and not without reason—that the traffic instructions referred to should be included in the curriculum of every public school, and such a general adoption of the plan is one of the aims of the Museum of Safety. It is the belief of the writer that seven out of ten motorcycle accidents involving a pedestrian are brought about through erratic and confusing action on the part of the latter. The pedestrian starts to cross the street, suddenly discovers the approaching

motorcyclist and then flounders nervously about until he is run down, or the motorcyclist has thrown himself and his mount to avoid a collision. It is to accidents of this class—easily preventable if the commonest rules of traffic are observed—that the Museum of Safety is directing its attention particularly. It is tackling a big and vital movement along practical lines, and is worthy of generous support.

MEDAL RACE IS CLOSE.

BALTIMORE, Md.—Every member of the Maryland M. C. who is striving to win the diamond medal offered for the best attendance record at runs will be put to a severe test before the first of the year, when the contest ends. Captain Staniford announces that he will call runs for every Sunday from now on, no matter how cold it may be or how much snow is on the ground. On Sunday, September 22, the club held the biggest run of the season, 100 riders joining in a spin over the new boulevard to Annapolis.

W. S. Fisher, the "grandpa" of motorcycling in Maryland, is making plans for a three-day tour through the Valley of Virginia.

HUDSON COUNTY'S SQUAD.

IN the accompanying photograph is shown the special boulevard squad of motorcycle officers attached to the Hudson County (N. J.) police department. This staff is one of the most active and efficient in the East and its members have many acts of heroism and daring to their credit. Not content with watching speeders, the Hudson officers render emergency service at fires and accidents, and half a dozen of the riders have stopped runaway horses after chasing them down at top speed on their machines. It goes without saying that Hudson County is proud of this squad, and the boys are leaving nothing undone to live up to their reputation. The officers, from left to right, are as follows: Schlemm, Bannon, Hanley, Schuler, Murray, Southard, Dolan, Boyle, Lieutenant McNamee, Chief Clossey, Lieutenant Broadhurst, Ryan, Schroeder, Coffey, Tuttle, Frost, Neary and Cuddy. The headquarters of the squad is at 2840 Hudson boulevard, Jersey City, N. J.

Motorcycle Squad That Has Established a Remarkable Reputation for Efficiency on the Hudson County Boulevard, Jersey City, N. J. Chief Clossey is the tenth rider from the left.

VISITING THE STATES.

Ontario Motorcyclists Enjoy Trips into New England, and Some Even Reach New York City.

TORONTO, Can.—A number of Ontario riders have been filling in the Autumn days with extensive excursions to distant points. Several have picked out the popular Buffalo to New York route, while New England has also been the stamping ground for the more venturesome. One of the biggest tours yet taken by a Toronto rider was Charlie Neilson's ride on an Indian seven to Boston and return, which reached a successful termination on a recent date. The puncture fiend only pricked his tire once, and otherwise he found that he had nothing to do but enjoy it. On the outbound flight, Neilson stopped over at Springfield, where he inspected the Hendee factory. Following Neilson's delightful experience other Toronto riders now propose following the same route before the snow flies.

Frank Benson, the secretary of the London M. C., recently saw the lights of Broadway when he piloted an Indian seven and sidecar to the Big Village in company with a 175-pound passenger. The only excitement of his ride was afforded when a sample size cyclone carried his machine, sidecar and all, completely off the road, but no damage resulted.

H. J. Stillaway, of Toronto, also recently covered the popular New York State route on an Indian, making Syracuse the turning point in his invasion. Harry Langford, of Ottawa, Ontario, recently Excelsiored from that city to Toronto, a distance of 300 miles, without mishap.

CLAUDE WITMER, of South Bend, Ind., is planning a long motorcycle jaunt, to cover 6,000 miles.

President Spencer, of the Canadian Motorcyclists' Association.

Mr. and Mrs. Moody and Machine on Which They Made 3,000-Mile Trip.

LONG-DISTANCE TOURISTS.

THE accompanying photograph shows Mr. and Mrs. E. S. Moody, of Glencoe, Minn., who recently finished a tandem tour over 3,071 miles of good, bad and indifferent roads. They covered 3,718 miles in all, but of this distance 647 miles were traversed in an automobile. The story of their trip to Chicago and then to Toledo, Cleveland, Erie, Pa., and Buffalo and finally to Niagara Falls, was told in the September 19 issue.

EN ROUTE TO THE COAST.

C. E. PARKER and Harry E. Patterson, of Pittsburgh, Pa., recently arrived in St. Louis, Mo., on their way to Los Angeles. While in St. Louis they were guests of the Hurck Motor and Cycle Company. They ride 7 h. Indians, Mr. Parker's being a Tourist Trophy model. They reported no machine trouble, but said that the roads in Illinois were not up to the mark, those in Pennsylvania and Ohio being considerably better.

A GOOD DAILY AVERAGE.

P. A. PAULSON, of Hettinger, S. D., and P. Paul Zick, of Big Stone, N. D., recently stopped at Stoughton, Wis., on a trip to Buffalo. Paulson rides a 7 h. twin and Zick a 4 h. single. They report fairly good road conditions, and state that they had no trouble in making 225 miles a day.

TWO GIRL RIDERS.

THE Harlem Motorcycle Club of New York City boasts of two girl members, who generally accompany the boys on their trips. They are Misses Florence and Ethel Willis.

MOTORCYCLE ANGLERS.

STREAMS near San Francisco, Cal., have been "fished out" and as a result motorcyclists are riding to the Walala River district, where the trout are still plentiful.

Secretary Gibson is working on plans for fire insurance on motorcycles belonging to F. A. M. members.

BUSY DAYS IN SAVANNAH.

SAVANNAH, Ga.—Members of the Savannah Motorcycle Club are looking forward to a busy winter season and say they will furnish enough news to keep the boys up north supplied until they are again able to ride. An early event will be a 120-mile endurance run to Statesboro, which will probably take place the latter part of October. The club is trying to arrange with the Augusta and Macon clubs to meet the riders in Statesboro for a reunion. On Christmas Day the club will hold a race meet over the Grand Prize course. Lee's birthday, which comes in January, will be celebrated by a run to Bailey's Place, where the boys will do justice to an oyster roast. Following this they will hold a 200-mile endurance contest over the Grand Prize course on Washington's Birthday. Besides figuring in a lantern parade the club will have its final endurance run to Belfast and return, a distance of sixty miles, in March.

A TOUR OF 1,500 MILES.

L. M. KRAMER and E. H. Gress, motorcyclists of Dayton, Ohio, recently reached Wheeling, W. Va., on a 1,500-mile trip. They visited many cities en route, among which were Cleveland, Buffalo, Albany, Boston, New York, Philadelphia, Hagerstown and Cumberland. They report the road conditions as being very good except in West Virginia.

A 2,000-MILE JOURNEY.

J. M. JACOBY and his cousins, N. B. and J. C. W. Jacoby, of Hutchinson's Station, Ky., recently arrived in Louisville, after a tour of four weeks on their motorcycles, in which time they covered 2,000 miles. They visited Cincinnati, Detroit, Lansing, Milwaukee, Chicago and Louisville.

ROUND-THE-WORLD TOURISTS.

I. R. MUNROE and P. Powers, motorcyclists of Australia, are in the United States on a jaunt around the world. They left Australia in April and have already toured England, Scotland and part of continental Europe.

ENGLISH NOTES

BY BRITISHER

Carbureter Controversy Is Interesting Many Close Followers of the Sport in England—Two of the Latest Sidecars—Protection for Rider From Heat of the Motor.

AMERICAN carbureter design differs so widely from British practice that our controversies in that department may not keenly interest your riders, but we are all agog at the ferocity of the warfare. The influx of duffers into the motorcycle world, due to the perfection of "no-trouble" machines which are good hill-climbers, has created a demand for a vaporizer which eliminates tap twiddling. Three types are fighting for the top rung. One is semi-automatic. It is of the usual British two-chamber type; the float is isolated in a separate barrel, and the jet is situated in a chamber of its own; all air is inhaled through fixed orifices along a line of travel at right angles to the jet axis and the jet is set behind the sliding piston which forms the

Rex Sidecar Chassis.

throttle valve. This piston chokes the flow of mixture, and also chokes the suction on the jet.

Lever Construction.

These vaporizers have two levers, but the air lever has only two positions—open and shut. It is shut for starting, after which it is banged right forward, and kept there all day, since movement of the choke-throttle suffices for all variations of speed and provides an approximately correct mixture at all speeds. This is at the moment the most popular type—a good starter, highly efficient and quite economical. Next to this in order of favor come the vaporizers which demand tap twiddling, and make some demands on the rider's intelligence. They vary in details of design, but are practically all of the two-chamber, two-lever type. Some have plain jets and plain airholes, each controlled by a sliding piston; others have variable jets, and even variable choke tubes, rare exceptions possessing three, and even four levers. A popular example of the more complex type utilize a stub jet lever in conjunction with handlebar air and gas controls.

The Truly Automatic Type.

The third class consists of the truly automatic one-lever type, and includes a variety of designs. A favorite example consists of two jets, each possessing its own choke tube. One jet is very large, with a choke tube to suit, and another very small, with ditto choke; as the throttle piston rises, it uncovers an extra air port towards the limit of its travel. This is a very efficient and convenient design, when the jets and choke tubes have been accurately adjusted to any given engine. One of its outstanding merits is the way you can kill "conking" by shutting the throttle down smartly so that the engine is confined to the small jet. Supposing an engine knocks when asked to pick up from practically a standstill in city traffic or on the hairpin bend of an abnormal hill; the "knock" ceases instantaneously if the gentle suction is concentrated on the small bore of the tiny jet and choke tube.

The popularity of change speed gears is sharpening the demand for semi-automatic and automatic carbureters. The owner of a three speed gear changes gear a hundred times a day; with a sensitive two-lever vaporizer he has to switch his carbureter control every time he changes gear; probably to shut the air down a notch; with an automatic or semi-automatic, he need not touch the gas controls.

Fin de Siecle Sidecars.

THE two accompanying cuts show examples of modern sidecar design. The stripped chassis is a Rex, of which the special feature lies in the double coil subsidiary springs fitted to the shackles of the main springs, which damp down the coarse oscillations of the big Ceas. The other is a Canoelet, fitted with adjustable talc windshield and folding luggage grid.

The Canoelet Sidecar.

A Valve Extractor

EVERY motorcyclist can trace his bluest profanity to moments when he has endeavored to extract an exhaust valve against the pressure of a 40 lb. spring, with no other tools than his fingers and a screw-driver. There is a growing and laudable tendency on this side for each engine maker to provide some simple and portable tool, by the aid of which the most refractory spring can be tamed. The cut shows the neat little vestpocket tool provided with British Triumph engines. The cut is almost self-explanatory. A steel cylinder is split vertically, its top and bottom plates being notched to catch below the spring cap.

For the Mudlarker.

THE two blocks inset in this paragraph show two tiny accessories which are invaluable for those sturdy spirits who motorcycle in all weathers. One is a sparking plug umbrella, which insures regular ignition

in the heart of a tornado. It catches the impinging rain, and guides it down clear of the mica or porcelain insulation to hiss harmlessly into steam on the hot head of the cylinder. (A similar fitment is used to a considerable extent on machines in this country.—Ed.) The other accessory is a waterproof terminal, scarcely essential with the modern magneto, but very useful with dry cell or accumulator ignitions, which—with their many connections, are rather apt to get "rained out" in a downpour.

Singer 2 1/2 h. Motor.

No More Burnt Trousers.

THE above cut shows a shielded Singer engine. A skeleton plate clips round the valvechest, and without preventing free radiation of heat, effectually prevents a rider's clothing from being scorched by the hot cylinder. The same cut gives details of a valvestem cover, held in position by a single milled nut. This cover silences the clack of the valves against their tappets, prevents oil being flung on the rider's leg, if oil should escape from a worn tappet guide, and safeguards both tappet and valve guides from the ingress of dust and grit.

A Duplex Valvelifter.

THE line sketch herewith appended shows a detail of interest to roughriders. No catastrophe is more distressing than an irreparable derangement of the valvelifter. It renders starting an awkward job under any circumstances, and if the throttle be leaky, and the magneto has no switch, stopping becomes a matter of equal uncertainty. The sketch shows the duplex valvelifter embodied on the English "L. M. C." machines. Only one lever is used, but it is provided with both pedal and handlebar controls, a flexible wire being coupled to the lever above, and a footrest

Foot-rest and Foot Exhaust Lift Lever.

pedal being added below. Only a very dire accident could disorganize both controls, so that the rider can rely on always being able to operate his compression release. The pedal is very useful for relieving the fingers of strain in coasting down prolonged grades.

A YOUNG EXPERT.

GEORGE LOFTES, ten years old, of Providence, R. I., can no longer claim to be the youngest rider of a Harley-Davidson motorcycle in the United States. This honor must now be given to Carl Worle, of Tampa, Fla., who is only eight years of age and who handles his 4 h. magneto model like a veteran.

COVER FOR CLEVELAND BOWL.

THE Luna Motordrome is to have a cover, and an entirely new track is to be laid. The old boards are to be torn up. The top is to cost in the neighborhood of \$10,000.

EDWARDS ON HIS UNICYCLE.

THE unusual photograph reproduced herewith shows Court Edwards on his unicycle at the Riverview Motordrome in Chicago. The picture was taken only a few days before the accident which resulted in the death of Edwards, and by a peculiar coincidence it shows the exact spot where he collided with another rider while driving his racing machine at top speed. Edwards was a plucky rider, always willing to take a sporting chance, and a favorite with the spectators and his fellow speedster. The photograph was taken by H. P. Cook, of Chicago, a racing enthusiast.

**A THREE-DAYS' TRIP.**

MATTHEW ROTH and Robert Ferritt, members of the Harley-Davidson Motorcycle Club, of Philadelphia, recently made a three-days' jaunt on their motorcycles. From Philadelphia they went to Trenton and Newark and then up the Hudson and back to New York City. The next morning they crossed over to New Jersey via Staten Island and rode through Long Branch and Asbury Park to Lake Como, where they stayed over night. From Lake Como they proceeded to Lakewood and Atlantic City and returned to Philadelphia.

MOTORCYCLES FOR SCOUTS.

SHERIFF, WALTER K. McANDORY, of Birmingham, Ala., recently purchased two new motorcycles to be used by his deputies for scouting purposes.

A CHART LIGHT.

IN the accompanying illustration is shown a neat little electric light for use on the handlebars of a motorcycle in connection with

a road chart. As it is during the hours of darkness that a route card is most necessary, the value of the lighting equipment will be at once apparent to the experienced tourist. Current for the light is supplied from a small dry battery which may be placed under the saddle as shown in the cut. The diagram is reproduced from a recent issue of *Popular Mechanics*.

ESLER'S EVENTFUL TRIP.

JOE ESLER, president of the recently organized Quincy (Ill.) Motorcycle Club, has been doing considerable road work lately and on one of his trips he reports encountering seventeen hills in a five-mile stretch. He left Quincy for Golden, 35 miles distant, and experienced no trouble until he started the return trip. He started back about 2 p. m., with rain threatening. Camp Point, six miles away, was reached without trouble; then after riding along the edge of a newly graded road, and passing six of the seventeen hills, Esler found plenty of excitement. The rain came down in torrents and the clay roads were soon in wretched condition. The rider finally reached the top of the eighth hill and decided to stop at a farmhouse. When he was ready to leave some time later, the farmer told him he had better leave the machine as it would be impossible to ride the hills. Following this advice Esler walked three miles to the next town and took a train back to Quincy, sending for his machine on the following day.

A WASHINGTON WINNER.

ONE of the prize winners in the recent endurance run from Hoquiam, Wash., to Tacoma, was L. L. Luce, who appears in the accompanying photograph with the Flanders

machine on which he carried off the awards. His winnings in the run are to be seen on the ground in front of the machine.

SOLVING *the* LIGHTING PROBLEM

A Comparison of the Gas Lighting Systems with Electric Illumination for Motorcycles.

WILLIAM HETHERINGTON JR.

ONE of the most interesting studies on the 1912 F. A. M. National Tour to Columbus concerned the lighting equipment carried on the various machines. In a body of riders, all of whom were riding under similar conditions, some general system of lighting might be looked for, but it was difficult to find two riders with the same equipment. Each individual had his own ideas about what should constitute a good lighting arrangement, and the choice of equipment ranged from the bicycle oil lamp to the modern acetylene and electric lighting systems.

In the early days of the motorcycle industry little attention was paid to lighting equipment by manufacturers, with the result that the old style bicycle lamps were utilized on motorcycles. As the industry expanded, however, the necessity for providing a more suitable lighting equipment was recognized by observing lamp manufacturers, and as a result the rider of today is offered a variety of lighting systems suitable for any condition. Motorcycle manufacturers also realized the necessity for providing suitable brackets for carrying lamps, and provision has been made in this direction

Selecting the System.

The proper lighting equipment to install on a motorcycle depends primarily on the use to which the machine is to be put. It would hardly be considered necessary to install a powerful headlight, for example, if the motorcycle is to be used solely for city use. An ideal lighting equipment must be efficient, reliable and durable. For city use an efficient oil lamp fulfils all requirements. It occupies little space, gives ample light and requires little attention.

The combined lamp and generator has the distinct advantage of being compact, and gives a good, strong light on a single charge, lasting about eight hours. It is necessary, of course, to refill the water reservoir frequently. The separate lamp and generator has all the advantages of the smaller combined type, and in addition does not require as frequent renewals of the charge. Gas generators require more or

less attention, and a rider who is not careful is likely to experience trouble, at which he condemns the lamp when the fault really lies with himself.

Any motorcyclist who has ridden during the winter months, dependent upon a lighting equipment in which water was one of the elements, knows that it is no fun to find an ice cake in place of the water supply when he tries to light the lamps. The advent of the gas tank eliminated most of the disadvantages of the separate generator supply, and this form of illumination has gained wonderful popularity.

Electric Lighting.

The newest type of lighting equipment for motorcycles is the electric system. As the separate gas tank system of illumination has become the most popular, a comparison of this type and the new electric system will prove of interest.

The essential features of reflector units are efficiency of illumination, capability to withstand heat, durability and compactness. The reflector should also be dust and moisture proof, as the efficiency of the mirror would otherwise be materially reduced. There are in common use three types of reflector mirrors: The metal type, mangin mirror and parabolic mirror.

The latter possesses a certain advantage over the other two. On account of its reflecting characteristics it is often preferred over the mangin mirror, and is the one in general use.

The method of grinding the surface of the mirror plays a most important part in its reflecting efficiency, and the silvering on the back should be done in a most careful manner in order to obtain the best results. By efficiency of illumination is meant the maximum beam of light which is projected out of the lamp. Very little light is absorbed by the reflector mirror; therefore nearly all the light produced is utilized, and in an electric headlight, with the lamp in the geometrical focus, practically all of the illumination is projected where it will do the most good. This is not true of the gas headlight, with the burner out of the geometrical focus, as by referring to drawing "A," it will be seen that all of the light included in the angle X is practically wasted.

Focal Adjustments.

A sliding adjustment has been developed for the electric type of headlight, which permits the changing of the focal length at the rider's will. The luminous center of the lamp socket may be changed relatively to the focus (Continued on page 58.)

A CLUBHOUSE NEEDED.

TORONTO, Can.—"We want club quarters," is the cry that went up at a recent meeting of the Toronto M. C., at which the attendance was well over one hundred. With the racing and touring season drawing to a close, the demand for a central meeting place for the members is growing in strength, and it is now intended to establish a large clubhouse, included in which will be pool tables, assembly room, gymnasium, repair shop, garage and other conveniences. The membership of the club is now over the two hundred mark, but it is felt that attractive quarters will accomplish considerable in inducing the city's many independent riders to join.

HARRY S. BEERS and George H. Abbott, of Buffalo, N. Y., recently completed a motorcycle trip through northwestern Pennsylvania and New York.

ELECTRIC HEADLIGHT

GAS HEADLIGHT

W. H. Jr.

A YANKEE ON EUROPEAN ROADS

MAXIMILLIAN ST. GEORGE

AFTER three hours of rather rough sailing I arrived in Ostend, Belgium. Here I had no trouble whatever at the customs house. The officer merely glanced at my customs ticket and international pass, asked me if the description of the motorcycle was correct and then allowed me to pass on. At my request two sailors, who had shown particular interest in my machine, escorted me to a hotel where lodging and meals were obtained at small cost. Here, also, my room and bed were all that could be desired.

The next morning, after eating breakfast, I set out for Bruges. The roads were very rough; I believe they are worse than any stone-paved street in New York or Chicago. There is always a narrow cinder path for bicycles, but this is forbidden to the motorcyclist. However, I risked arrest and rode on it, only to find that it also was quite bumpy, but better than the cobblestones. When stopped by a gendarme I would plead ignorance and mumble some complaint about the road, pass on, riding the stones until out of sight and then returning to the side-path.

These stones were the cause of considerable tire trouble. The outer tire would not be cut or punctured, but the inner tube was often split. I had two punctures of this character before reaching Bruges and three on the road to Ghent. From Ghent to Brussels I did not meet any gendarmes and so was able to ride the cycle-path and thus avoid punctures. The courtesy and hospitality of the inhabitants somewhat offset the troubles of the road. The distance from Ostend to Brussels is only eighty-one miles, yet I did not reach the latter place until 3:30 p. m., rather slow going.

From Belgium Into Holland.

In Bruges I bought ten litres of gasoline for fifty cents. In other places it cost about twice as much; I paid forty-five cents for five litres in Ghent. From Brussels the tourist should enjoy a trip to one of the magnificent parks, six miles out from the city. Here may be seen the house which is used by any distinguished guests of the king. At a museum here may be seen a great variety of interesting objects. It goes without saying that the motorcyclists will find it worth while to take a trip to Waterloo, the scene of Napoleon's last battle. From Waterloo a splendid road leads to Gwendoel, Moline and Antwerp and on to Holland. I took the route through Fervuiren,

Lourain, Tirelemont, St. Trond and Tongres to Masstricht, Holland, and had good macadam roads part of the distance. This was a day of misfortune for me, however. I lost my water-proof cap, had two blow-outs in one of my inner tubes and took a spill when traveling at the rate of twenty-five miles an hour. As a result of the spill my machine got a punctured tire, a badly bent footboard and a caved-in exhaust pipe. A mechanic at St. Trond fixed everything for twenty cents.

At the Dutch customs office I had merely to show my international pass and customs ticket for Holland. The officer did not even compare the description with my machine, simply asking me if it was correct. All through Masstricht, as in Belgium, the street pavements are bad. One would think the builders wanted to see how roughly they could lay the stones. The roads in Holland, however, are generally either macadam or brick paved and both are very good. They are lined on either side by rows of big trees. I rode along one of these roads at thirty miles an hour to the home of a friend, where I stayed overnight.

Hills and Fine Scenery.

The next morning at 9:30 I started for Germany. The roads were good and traveling was unhindered. At the German customs house no official appeared. I approached slowly, stopped for a minute and then rode on. The dreaded German customs had been passed. The roads at once became very good. The road from Juelich to Cologne continued good and were lined with fruit trees. Good substantial meals may be had at very reason-

able rates. A good road leads from Cologne to Bensberg, Engelskirchen, Gummersdorf, Olpe and Westphalia. Along this route I enjoyed some of the best scenery of the trip. I stopped for the night at a roadside inn a mile or so from Olpe.

The price of gasoline ranges from 9¼ to 14 cents per litre. Dapolin, which is considered a high grade of gasoline, sells for about eleven cents per litre. I rode on through a number of towns and had a couple of steep ascents to climb. That night I stopped just outside of Hirschberg and was surprised to meet a friend from my home town.

In the morning I began the passage of the Harg, the most interesting and beautiful mountainous country in western Germany. I rode up the Seiber river over a poor road to Seiber. From here the road is good to Andreasberg. At this point is the steepest climb I ever made. My machine reached the top much to my surprise and to the disappointment of the natives who had been expecting it to fall backwards. Then there is a long ascent to Brownloge and one to Elend. After that comes a long coast to Rotehutte and Elbingerode. Here the Harg ends and the country in general descends to Heimberg through the Dricksthal. From Pfefferkrug through Halberstadt, Magdeburg, Potsdam and Berlin the road is good.

A couple of times along the road when trying to find the cause of a flat tire I received help from some passers by. In one place they not only got a pail of water, but brought out a stool for me to sit on. From Magdeburg to Potsdam I rode from thirty to thirty-five miles an hour. Then along the splendid Kronprinzessin Strasse I was able to make forty-five miles an hour to Berlin.

Hard Luck in Berlin.

I made a comparatively short stay in the German capital, being anxious to get out on the road again. My motorcycle had been left with a mechanic to have the spark control repaired and a new inner tube put in the rear tire. I called for the machine the morning I was to leave, and was dismayed to learn that a tube of the size required could not be obtained in Berlin. However, the dealer happened to have a tube from an Excelsior, and as it was rather old and none too soft and elastic, he let me have it for six marks (\$1.49). After dinner I set out for Jossen, but had not

Scene on Lake Aussee, Switzerland.

gone far when an accident befell me, and I had to go back for repairs. That evening, after calling for the machine, I took my cousin out for a ride on the carrier, which resulted in another minor accident and more repairs.

On account of a heavy rain the next morning I was unable to start before 11 o'clock. All went well until I was about three miles from Jossen, or 15 miles out of Berlin. I was just entering a small town when a dog sprang out at me. My front wheel swerved and struck a stone, breaking the front forks and bending the wheel out of shape. Several spokes were also torn out. There was only one mechanic in the place, and he was unable to repair the machine. While I was wondering what to do a large auto truck, drawing a second truck, came along on its way to Berlin, and the driver consented to take me with him. We were soon in the capital again, and the driver carried me to a mechanic, who said he could fix my motorcycle if anyone could. The mechanic and his assistant set to work, and

by 11 o'clock had the task finished. The entire job cost only \$2.38.

Striking Mountain Scenery.

I was out of Berlin by 8 o'clock the next morning, and had good roads through Jossen, Golssen, Lukau and Elsterwerda. From Elsterwerda to Saxony the road was alternately rough and sandy, and from Saxony, through Grossenhain to Dresden, it was very good. The road passes through the beautiful Moritzburg, a royal hunting lodge, six miles north of Dresden. Road menders were at work all along the line, and it is quite probable that the stretches of bad road mentioned will soon be in good shape. Early in the afternoon I left for Bastei, a peak overlooking Saxon-Switzerland. This is a beautiful mountain region, filled with grotesque, pine-covered sandstone peaks and gorges. In rounding a sharp curve near Bastei I ran into a low ditch and broke off the nut holding the supports of the footboards, but had no difficulty in making repairs. From Bastei I rode back a short dis-

tance to a good road which leads to the main route to Schandau. This is a summer resort in the heart of the mountains, and the surrounding scenery is grand. The ride to Bastei and Schandau is the finest I have had in Germany.

At Schandau I crossed the Elbe over the Körugen Carola Brücke. The road is good to Krippen, where it becomes poor, with steep ascents. I passed through Rologmukle, Forstmukle and Cunnesdorf, from which point a rough and sandy ascent and a poor road lead to Rosenthal, the last German town before entering Austria.

Just outside the town are the German and Bohemian customs, a short distance apart. It was 8 p. m. when I reached Rosenthal. I had no German money, only American Express money orders, and not caring to sleep in the open I persuaded a farmer to let me sleep in his barn. I had no trouble with the German or Bohemian customs, but when I reached the Austrian official he wanted to see my triptyque. I assumed surprise, and went on to explain that motorcyclists did not require them, they being for automobilists only. He took my word for it, and I soon had a pass from him and the seal of the customs office on the motorcycle.

Along the Picturesque Elbe.

After paying seventy-one cents for a gallon of gasoline, I again set out and found good roads leading through a pine forest to Bodenbach, on the Elbe. Bodenbach is opposite the famous castle of Teschen. The road then follows the Elbe to Aussig, and is very poor. At Aussig I paid sixty cents for gasoline, and on the next day it cost me seventy cents, this being the highest price I paid while in Austria. The road continues in the picturesque valley of the Elbe to Teplitz. Through Brux, Kominatau, Kosterle and Carlsbox the road is pretty well worn, but the scenery is good. Just outside Carlsbad I got a two-inch nail in one of my tires; this was the first external puncture of the trip, and I had traveled 1,214 miles. As I went to mount my machine after the repair I found it impossible to turn the handle of the spark control. With a wrench I tried to loosen it, and after a few minutes I broke one of the pins. There was nothing to do then but return to town, and I had to wait over till the next day.

The next morning I took the road to Pilsen, via Petschan, through the beautiful Tepglans. The road was very slippery, and I could not make more than 10 miles an hour. That afternoon I had to make a stop on account of rain, but it did not last long, and I was soon on my way again. I passed through Horazhowic, over good roads, and at 7:30 p. m. I stopped at a hotel just beyond Strakowic. The accommodations were the poorest I had struck so far. The next morning in Budweis I again paid sixty-one cents per gallon for gasoline. Another downpour of rain made it necessary to seek shelter, and when I was ready to remount I found that my rear tire was flat. This was caused by the same nail puncture I received the day before, so I decided to remove the tube and replace the old one I had taken off in Berlin. To Linz, on the Danube, the capital of upper Austria, the road was slippery but generally good.

From Linz I was able to travel at thirty and more miles an hour through Wels and Lambach, and along the beautiful Traun river to Grounden and Traunkirchen, on Traun See. This was an enjoyable jaunt.

(To be continued.)

SOME ROUGH-RIDING

New Yorker Found Plenty of Road Variety and a Few Thrills on Pleasure Trip Into Vermont.

FRED JUKSCHWERDT, of New York City, who recently made a trip from the metropolis to Hinsdale, Vt., writes of his experiences as follows:

"It was 2 p. m. when I got under way and a little after 8 o'clock I reached Newton, Conn., having traveled 79 miles. The roads in New York were in excellent condition, but in Connecticut they were rather rough. I reached Danbury at 5.30 p. m., where I had lunch, and at 6 o'clock I was again on my way. Newton was only eight miles away, but on account of a five-mile hilly stretch, which was also rocky in places, it took me over two hours to make it. I had to push my machine much of the way.

"The next morning I started at 8 o'clock and rode to Sandy Hook, Conn., where I bought some rope and a gallon of gasoline. I was soon traveling again and found good roads to Plainville, where I stopped for gasoline, and then continued on to Hartford. From Sandy Hook to Hartford is 33 miles and I reached the latter place before 11 a. m. I had dinner and was on the road again by a few minutes after eleven. I had fine riding and reached Springfield, Mass., at 5 p. m. After eating a little supper I left for Greenfield over good roads and reached there by 8 o'clock. It was dark by this time and after lighting my lamp I set out for Brattleboro. The road was very bad and at one place where it was being repaired I had to walk about a mile. I reached Brattleboro at 9 p. m. and shortly after 10 o'clock I arrived in Hinsdale. I used but three and a half gallons of gasoline and two quarts of oil for the trip."

WITH BALTIMORE RIDERS.

BALTIMORE, Md.—The scheduled run of the Maryland M. C. to Harpers Ferry, W. Va., on Sunday, September 22, was called off by Captain Staniford, owing to the bad condition of the roads. A blind run was held, however, and the mudlarks had their inning. President Frank Boyd is laying plans for a minstrel show to be given by the members in the near future.

August Zimmerman, of this city, who is now a member of the Hendee force, left Springfield, Mass., early last Wednesday morning on his machine and arrived in this city about noon on Friday. The time he made was considered remarkable as he struck a heavy rain storm after leaving Springfield and it continued until he reached here.

The Chesapeake M. C. will hold its annual mask ball this month, arrangements for which will be made at the next business meeting.

CENTURY TANDEM TRIP.

B. S. AND H. B. EBERSOLE, of Sterling, Ill., recently made a run to Clinton, a distance of 108 miles, riding tandem on a 4 h. Flying Merkel, in five hours and fifty minutes. They left Sterling at 10 a. m. and arrived in Clinton at 7 p. m., after passing through Prophetstown, East Moline, Moline, Rock Island, Davenport, Bettendorf and Princeton to Clinton.

MEET POSTPONED.

THE racing program scheduled for the Tuileries track in Denver on September 15, was postponed owing to the fact that the funerals of Eddie Hasha and Johnnie Albright were held in the Colorado city on that date.

FRED and Hendon Vann, of Birmingham, Ala., recently made a trip to Washington, D. C., and return on their Indians.

Mrs. Helen White, of La Porte, Ind., appears in the photograph at the left with her Pope machine. Enclosed herewith is a reproduction of the medal presented to her by the Pope Mfg. Co.

MEDAL FOR MRS. WHITE.

MRS. HELEN WHITE, of La Porte, Ind., who distinguished herself on the recent F. A. M. run from Indianapolis to Columbus, by being the only woman motorcyclist to complete the trip on a single-passenger motorcycle without assistance, has been awarded a handsome silver medal by The Pope Manufacturing Company. In speaking of her experience on the trip, Mrs. White said: "The Pope brought me through without trouble of any kind on less than a quart of oil (175 miles), and 2½ gallons of gasoline. I made the trip with only one fall and that was caused by heavy dust. I tried the board track on the Pope and everyone was surprised at the speed I could get out of it."

A NEEDED REFORM.

COLUMBUS, Ohio, September 28.—Because of accidents lately in which motorcycles and automobiles ran into horse-drawn vehicles after dark, and in which a number of pedestrians were injured, the city council judiciary committee has voted for the passage of an ordinance requiring all vehicles, horse-drawn or otherwise, to carry lights front and back. To relieve the motor cops of part of their work the council provided an automobile for the use of a traffic officer, whose duty will be to arrest all offenders of the new law compelling vehicles to come to a stop on approaching street cars that are discharging passengers.

OHIO ROAD IMPROVEMENTS.

COLUMBUS, O., Sept. 23.—Bids for improvements amounting to almost \$150,000 are being advertised for by the State Highway Commissioner of Ohio, and contracts that will improve several miles of country roads throughout the State will be let as soon as possible.

EIGHT SHORT GRASS RACES.

EIGHT events, two amateur and six professional races, constituted the program at the State meet given by the Short Grass M. C. at Oakdale Park, Salina, Kan., Saturday, September 28.

400 MILES through NEW ENGLAND

D DWIGHT B. PANGBURN

FOR some time I had been looking forward to a vacation trip on my motorcycle and when Old Pal Amos called me by telephone one fine morning and announced that he was in a mood to start out with me that day, I jumped at his proposition. We overhauled our machines hurriedly and cleaned up a few business details during the morning and were ready for the road at 4 p. m. Accordingly we headed for Hartford. We could go via Middletown and up the Connecticut River or across country through Wallingford and Meriden. The lure of six miles of brand new State road just south of Hartford led us to choose the latter way, which in addition to the new road mentioned had very good roads all the rest of the way—or so we thought.

About a mile south of Wallingford we had to make a detour, as the main road was being asphalted. Here we had to climb a long hill of moderate grade on a narrow rutty road. We would have made it easily but for a road hog with a New York license (in New England almost all the road hogs seem to be in cars bearing New York licenses), who forced us into the ditch. There was no injury save to our feelings and after a half mile we reached the main road again and proceeded to Meriden.

On leaving Meriden we found the road builders had been at their old trick of dumping loose crushed stone on the road and leaving public spirit to roll it down. This lasted for two miles; then we struck good roads again and soon reached the above mentioned new State road, the Berlin turnpike. For several miles this road runs straight, over a succession of hills, resembling a gigantic switchback. It had been recently oiled and not sanded but we easily made up the time lost further back, and pulled into Hartford, 37 miles, at 5:45, a little ahead of schedule, which we had set at 20 miles per hour.

Into the "Slough of Despond"

We did not stop in Hartford but pushed for Springfield. In the July 11, 1912, issue of *MOTORCYCLE ILLUSTRATED* sandy roads were mentioned on the west side of the Connecticut River, so we took the east side, crossing the new bridge at Hartford. This gave us fine results till we reached Thompsonville, 6 miles south of Springfield. There had been heavy rains the night before in this section and the road, owing to hard usage, had become a pit of clay and mud. At length after a mile of riding with feet hanging out at the sides to save us from falling when our machines skidded, we saw ahead the last of the red lights that marked the new trolley construction and knew that good traveling lay before us. But between was a valley which contained the

Slough of Despond. Down into it we plunged—and stuck. Our machines were both singles, but I have ridden twins and a twin would have stuck too, I believe. Half the road was plain mud and half was mud interspersed with trolley ties. Simultaneously we hit the ties and began a succession of bumps and splashes. On the first tie my light went out; on the second Amos' followed its example.

Just after our lights went out and we were stranded in the middle of the slough a heavy touring car came over the crest of the hill and rushed down on us with open muffler, getting speed for the climb ahead. With one accord we seized our horns and blew with all our might, trying at the same time to get out of the road. About that time the driver saw us, set his brakes and slid to a standstill a couple of feet from us. After this narrow escape we lighted up once more and tried to start on. Again our lights bumped out. On the next try, however, we succeeded in pushing our machines up the hill and reached the macadam pavement through Longmeadow, arriving at Springfield at 7:45, having covered 64.8 miles, 30 minutes behind schedule.

The Run to Boston

On Saturday morning we went on at 8:35 and had a fine run over the excellent Massachusetts State roads to Worcester, which we reached at 11:15, 50 miles from the starting point in Springfield. We wished to get to Boston as soon as possible and so did not stop at Worcester. We had followed Blue Book routes so far and continued to do so, finding the roads from Worcester to Boston the best yet. We entered Boston past Norumbega Park on the asphalt speedway which is an extension of Commonwealth avenue, reaching the Common at 1:45, and completing a run of about 95 miles in 5 hours, 10 minutes. This was a little behind schedule and we found during the entire trip that it was not possible to average more than 16-18 miles per hour with any degree of satisfaction.

Meeting a Good Samaritan

We left Boston Common at 9:15 Sunday morning, intending to follow the Blue Book route to Plymouth. But we could not find Morton street, which we should have traversed; so we started in the general direction according to our own ideas. Just then luckily appeared one of the very few members of the fraternity that we had seen in Boston. He was mounted on a Pope and had what I took for a brass bicycle lock hanging on one of his saddle springs. Later I discovered it was the only license tag he was required to carry. Naturally our Connecticut number plates, 3 inches

wide by 10 inches long, and one on each end of the machine, caught his eye. He saw that we were strangers touring and probably mistaking our way—an easy thing to do in Boston—so he hailed us and asked where we were heading. Upon our saying Plymouth, he cheerfully informed us that we had picked the worst possible route, as to continue that way would mean riding over 7 or 8 miles of cobblestones. Then he volunteered to show us the right way, and went 5 miles out of his way to show us ours.

We went on down the south shore through the quaint towns of Quincy, Hingham, Nantasket, Cohasset and Scituate, to Marshfield. Here we turned off the State road and ran out to the little settlement, mostly of summer people, to Brant Rock. The principal thing of interest here, and the cause of this 5 mile side trip, is the National Electric Signalling Company's wireless station. We reached Brant Rock at noon, after a run of 47 miles, and took dinner at the Brant Rock House; if they always serve such food as they did to us. I advise motorcyclists to avoid them as a pestilence. We were dressed in khaki riding clothes, which in Boston had resulted in our being railroaded from the restaurant floor down to the cafe in one case at least, and we did not mind being put at a separate table in one corner of the dining room, out of sight of the better clad diners, but we did object to second class food as well.

More Sandy Roads

It was also at Brant Rock that we had our first and only tire trouble. I picked up a piece of iron wire of about No. 12 gauge and maybe three inches long. From Brant Rock we cut across country to the State road and down to Kingston. From here we started for Middleboro over the route listed in the Blue Book. The road is not very good anywhere over this stretch of 12 or 14 miles and in some places, aggregating perhaps 4 miles, it is very bad. In these spots it consists merely of a couple of ruts 6 to 12 inches deep wandering like lost souls in a devious course over a sea of sand. To meet or catch up with any other traffic in those spots is fatal. It means you have to shut off power and run into the ditch, and then push your machine to the end of that particularly bad stretch, for it is next to impossible to start from rest and get speed enough to be able to stay in your rut.

We wished to make Rhode Island that night, so we decided to cut across country to Fall River, instead of going around the regular route, by way of Taunton. I would not advise any one to try this. The older Blue Books give a route through here but the 1912 one

leaves it out altogether. Although the way is perhaps 9 miles shorter, I do not think any time is saved by going that way for the roads for the first half of the way are execrable. We arrived in Fall River at 6:05 p. m., having taken 65 minutes for the 16 miles from Middleboro.

Pleasant Run to Newport.

Fall River is primarily a manufacturing city, and every one knows that where drays and trucks are the only vehicles, cobblestones are the usual pavement. Fall River is no exception to this rule. After passing several stretches where the road was being fixed we arrived at a bridge and lighted up just after crossing it. We went on for about 5 miles and put up for the night at a farmhouse. We rolled our machines into the barn at 7:15 p. m., having covered 101.8 miles during the day. The next morning, Monday, we left at 8:30 and ran down to Newport. The 10:00 o'clock ferry for Jamestown and Saundertown was three minutes late in starting and we got on board at 10:02, thus missing by one minute, a one hour wait.

The ferry took us to Conanicut Island. There is a half-mile run across the island and another ferry to Saundertown (20c. each ferry), from which place a good road leads to Narragansett Pier. We arrived at the pier at 11:00 and then headed for Westerly. The trip from Narragansett Pier to Westerly was very unpleasant. The road was once macadam but it is worn out and full of holes. Eighteen miles of this took us to Westerly, where we stopped for refreshments, knowing that we had a bad section before us for 16 miles into New London.

The road to Stonington, once the richest city per capita in the United States, is the same as that to Westerly, and then it turns to sand. The road is not only sandy but there are numerous steep hills and bad curves.

An Emergency Pedal Repair.

We reached Groton at 3:32, just in time to miss the 3:30 ferry for New London—would that ferries were always as nearly on time as that. It had taken us an hour and a half to ride 16 miles from Westerly, and we were glad of 15 minutes' rest. We were sure that the road west from New London would be good, and after the first two miles it was. This two-mile stretch was sandy with projecting boulders here and there. One of these projected so far as to strike Amos' pedal and snap it off. We picked it up and proceeded on our way. At the first country blacksmith shop we stopped and Amos got a ¼-inch bolt about 4 inches long, and two nuts. He put the threaded end of the bolt through the hole in the pedal crank, with one nut on the inside and one on the outside. When the nuts were tightened up he had an improvised pedal which did very well.

After this little delay we went on towards the Connecticut River, the roads getting better. The new Saybrook-Lyme bridge is a toll bridge and we paid 15 cents toll. The toll-taker cautioned us to keep our receipts, as ten of these entitle one to a free passage. It was then 5:30, but the roads were good all the way to New Haven, and we decided to try to make 35 or more miles by daylight. We did not quite succeed, as the main road is also the main street of all the little towns along the shore, but we reached home at 7 p. m., having covered just 392.6 miles in all, and 128 miles for that day.

ANOTHER TIME-SAVER.

G. R. EWALT, of Abilene, Kan., is among the riders who are helping to prove the commercial as well as the purely social advantages of the motorcycle. Mr. Ewalt is employed by the United Telephone Company at Abilene and his official trips are usually made on his motor two-wheeler. He reports a material saving in time and general expense since purchasing his Emblem mount.

NEW ENGLANDERS ON TOUR.

WILLIAM H. STEBBINS, of the firm of Stebbins & Geynet, Eastern Connecticut agents for the Flying Merkel, accompanied by Charles Perry, Jr., and Peter Disjardins, all mounted on 6 h. p. Merkels have just completed a journey from their home town, Norwich, Conn., to the Merkel factory at Middletown. They left Norwich on Sunday, September 22, accompanied by a party of local enthusiasts who rode with them as far as Hartford. Striking out from Hartford, they went by way of Springfield and Pittsfield into Albany, making the trip through the Berkshires without mishaps of any kind.

NEW REGISTRATION RULE.

A CHANGE in the method of registration of motorcycles is to be made by the automobile division of the State Highway Department of Pennsylvania for 1913. Heretofore motorcycles have been registered on blanks similar to those provided for automobiles, but next year's licenses must be obtained on a special blank. The registration of motorcycles this year to date is over 7,100, against 4,826 last year. Each registration costs \$2.

RACES PLEASE BIG CROWD.

COLUMBUS, Ohio, September 27.—The motorcycle races held at the Delaware County Fair, Powel, Ohio, were witnessed by a large and enthusiastic crowd. The half-mile track is new and well banked. Competition was keen and no serious accidents occurred. A. A. Case, of Ohio State University, was chief promoter of the races and Mr. Gorrrell served as official referee. Summaries: Five-mile novice; Converse (Harley-Davidson), first; Dressel (Indian), second. Time, 6:25.

Three-mile stock; Bascom (Thor), first; Hall (Thor), second. Time, 4:7.5.

Five-mile open; Bascom (Thor), first; Dressel (Indian), second; Wells (Merkel), third. Time, 6:24¼.

Fifteen miles, open; Evans (Indian), first; Yates (Excelsior), second. Time, 18.38.

Bascom (Thor), threw a tire in last lap.

OHIOANS STILL HOPING

Good Roads Boosters of Buckeye State Will Ask for Direct Tax to Raise Big Improvement Fund.

COLUMBUS, O., Sept. 23.—Defeat of the good roads amendment in the recent constitutional amendment election will not prevent a good roads contest in the next General Assembly of this State. Officials of the Good Roads Federation declare that the Assembly will be asked to make a direct tax levy for road building. This will be the alternative to the bond issue now impossible under the present constitution of Ohio.

There are many who believe that the direct levy for roads will stand a better chance with the Legislature than a bond issue would have, had the amendment been ratified by the people. The good roads supporters say the fact that the amendment lost by a margin of only two thousand votes shows that the sentiment for improved roads is strong and that the Assembly cannot fail to take cognizance of it.

The precise plan of the Ohio Good Roads Federation is to ask the Assembly to make a direct tax levy for good roads of one-half mill. It is estimated that this would mean a revenue of \$3,000,000 annually, and would thus involve an appropriation of approximately \$6,000,000 by the Assembly for the next two years.

TWO GLOBE-GIRDLERS.

J. S. CLANCY and Joseph Storey, of New York City, sailed a few days ago for London, Eng., to begin a tour of the world on their Henderson machines. Mr. Clancy is a writer on the staff of *System*, and Mr. Storey is known through his writings in connection with moving pictures. The object of the round-the-world tour will be to obtain material for a book of travel and also to lay out a globe-girdling route. The prospective volume will be illustrated by photographs taken by the authors and in addition to being an entertaining travel book it will serve as a motorcycle "Blue Book."

Messrs. Clancy and Storey will go from London into France and then take up their course through Germany, Switzerland, Austria, Turkey, Egypt, India, Siam, China and Japan. They will then take steamer across the Pacific and ride from San Francisco to New York to complete their trip. The travelers will carry all their luggage on their machines. From time to time they will write of their experiences along the route and these articles will appear in *MOTORCYCLE ILLUSTRATED*.

PITTSBURGH MEET.

RACE followers were so enthused over the last motorcycle race meet given by the Pittsburgh (Pa.) *Press* that it has been decided to hold another similar event. The *Press* has arranged for five events to take place on the Schenley Oval on October 5.

A UNIVERSITY CLUB.

COLUMBUS, O., Sept. 24.—Following the opening of college last week, the Ohio State University Motorcycle Club is planning an organization meeting to be held at an early date. The club had about 40 members last year and the outlook is bright for a larger membership this year.

MANUFACTURERS

ADDITIONS TO MIAMI STAFF.

THAT the Miami Cycle & Manufacturing Co. is leaving no stone unturned to complete a perfect organization was further made evident this week when additional appointments were made to the factory and office forces. One of the most important announcements was to the effect that F. C. Kapp, formerly of the Flanders staff, has been secured to assume full charge of the automatic machinery division of the big plant at Middletown. Another appointment was that of S. G. Prest to the position of chief inspector. Mr. Prest formerly held a similar position with the General Motors Co. L. S. Taylor, for several years with the Emblem Manufacturing Co., and well known in racing circles, also has joined the Miami forces, and will be associated with Chief Engineer Joseph Merkel, in the engineering department.

C. A. Carroll, until now with the sales and advertising department of the Elyea-Austell Co., of Atlanta, Ga., has been appointed assistant advertising manager, and will assist Messrs. Ash and Valiant in the sales and advertising departments. He entered upon his new duties this week.

NEW WILLARD BATTERY.

REALIZING the growing demand for electric headlights for motorcycles, the Willard Storage Battery Company has developed a new type of LBA battery, particularly suitable for this service. This battery is made to be used in connection with 2-volt lamps and is capable of delivering a light far superior to the acetylene headlights usually carried. It will run the lamp for from 30 to 35 hours continuously before recharging.

The battery embodies all the features of the LBA battery which has made it a success in automobile lighting; but it has been constructed especially rugged and acid-tight to stand the severe service on a motorcycle. The battery weighs only eight pounds and can be attached in any convenient place on the frame of the motorcycle.

CANADIAN PATENT ISSUED.

CANADIAN patent rights on its Simplex spring tandem attachment have been obtained by the Angsten-Koch Company, of Chicago.

THE Graton & Knight Mfg. Company's Canadian distributors are the Canada Cycle & Motor Company, Ltd., with offices in West Toronto, Winnipeg and Vancouver.

NEW SPEEDOMETER READY

Corbin-Brown Instrument, Produced by Well-Known Brake Makers, Is the Latest Arrival.

THE Corbin Screw Corporation Division of the American Hardware Corporation, known to the entire trade as the manufacturer of the famous Corbin coaster brake, has entered the speedometer field with a new instru-

ment to be marketed under the name of the "Corbin-Brown." This speedometer is an adaptation of the "Corbin-Brown" automobile speedometer which has become generally known as the "speedometer of permanent accuracy."

The Corbin-Brown motorcycle speedometer is built on the centrifugal principle, and is therefore unaffected by temperature changes. It is claimed that it is just as accurate during the zero of Christmas as during the torridity of July. Compound governors make it doubly sensible to the speed of the wheel. The mechanism is extremely simple and the few parts are big and strong. The Corbin-Brown is sold under a one year's guarantee, which not only covers the speedometer as a whole, but its parts as well. It is listed at the extremely low price of \$15.

The Corbin Screw Corporation Division is now prepared to furnish special brackets for the Indian, Harley-Davidson, Excelsior, Pope and Merkel motorcycles. Brackets for other makes will be ready shortly.

NEW ERO QUARTERS.

ANNOUNCEMENT is made that the Ero Manufacturing Co., formerly located at 914 West Jackson Boulevard, Chicago, has moved to more spacious quarters in the Halton building, 408-418 West Indiana street. The company has added a number of attractive new specialties to its line and preparations are being made for a heavy output with the opening of the 1913 season.

ASUNDAY run to Chandler, Ariz., was recently conducted by the Phoenix M. C., under the direction of Captain J. Young.

PHARIS COMPANY REORGANIZES.

COLUMBUS, Ohio, September 28.—The Pharis Tire and Rubber Co., recently incorporated, held a reorganization meeting this week at which A. R. Lindorf was elected president, R. W. Pharis, Secretary-Treasurer, and Carl Pharis, General Manager. The company decided to reopen the factory of the Newark Tire and Rubber Co., now owned by them after equipping it with additional machinery. The output of the Newark factory is about 50 motorcycles and automobile tires daily.

NEW R-S. DISTRIBUTORS.

EUGENE COUGHLIN, manager of the Riverside Motorcycle Garage, 533 West One Hundred and Tenth street, New York, has been appointed distributing agent for New York (Manhattan and Bronx boroughs) and Westchester County for the Reading-Standard for the coming season. Coughlin has been connected with the industry for a number of years, and has participated in practically all the star events in the Middle States since 1909. Indications of a boom season for the R-S are already discernible, nor are like symptoms wanting in the Eagle line, for which the Riverside Garage is also agent. An aggressive sales campaign has already been started.

AN ALL-WINTER SCHEDULE.

ALL of the United States Tire Company's factories will be operated during the coming winter on full summer schedule. This means that they will be run night and day, three shifts of workmen being employed. The decision to continue this plan, begun last year, was reached at a conference in New York last week between General Manager J. M. Gilbert and the company's factory managers, W. McMahon, of the Detroit plant; J. M. Patterson, of the Providence plant; Harlow W. Waite, of the Indianapolis plant, and C. B. Whittelsey, of the Hartford plant.

MATTHEWS HANDLES SALES.

"SHORTY" MATTHEWS, well known as a speedster of the Thor camp, has assumed charge of the Aurora Automatic Machinery Company's retail sales department in Chicago, the vacancy having been left through the resignation of Mr. Freeman. "Shorty" is well liked in trade and racing circles and is counted upon to whoop things up in his new position.

AN EMBLEM STOLEN.

ARED twin Emblem, engine No. 7335, was stolen from the freight house at Landisville, N. J., recently, and dealers and repairmen are requested to be on the lookout for it.

MOTORCYCLISTS of Gulfport, Miss., and suburban districts recently held a meeting to lay plans for a motorcycle club and expect to effect an organization in the near future.

**Two Views of the New Dayton Twin,
Manufactured by the Davis Sewing
Machine Company, of Dayton, Ohio**

PREVENTS TIRE-CREEPING.

OF interest to motorcyclists as well as automobilists is the announcement that Clarence E. Falor, of Akron, Ohio, assignor to the Goodyear Tire & Rubber Company, has been granted a patent for a device to prevent creeping of tires upon wheel rims. It comprises a tubular member of greater rigidity than the inflating tube, positioned around said tube. The intermediate portion of said member where it extends in the wheel rim is exteriorly threaded to receive a clamping nut for connecting it to the rim, one end of said member being provided with a disc shaped lateral flange arranged on the wall of the tire, the opposite end being so designed as to be collapsed against said inflating tube when a valve casing is positioned therein for holding the latter against displacement.

INCREASED TERRITORY.

COLUMBUS, Ohio.—L. P. Birkenbach, located at 17 North Fourth street, Columbus, has closed a contract as central Ohio distributor for the Thor, in 16 counties. He will appoint a large number of sub-agents. The territory covered by the concern is considerably larger than last year.

MERKEL DISTRIBUTORS.

AN announcement of considerable interest to the motorcycle trade at large, and especially to the Southern field, was made this week by the Miami Cycle & Manufacturing Co., of Middletown, O., to the effect that the Elyea-Austell Co., of Atlanta, Ga., will be the Southern distributors of Flying Merkel motorcycles. The territory included in the new agreement will be the States of North and South Carolina, Georgia, Florida, Alabama, Mississippi, and the eastern part of Tennessee.

NEW INDIANAPOLIS FIRM.

DOUGLAS & TALBOT, of East Ohio street, Indianapolis, are going into the motorcycle field next spring with the Triumph agency. Mr. Douglas was formerly with Gus Habich, the Excelsior agent.

NEW PRESTO INTERESTS.

ONE half the capital stock of the Esterline Company, of Lafayette, Ind., which totals \$250,000, was purchased recently by Carl Fisher and J. G. Allison, owners of the Presto-O-Lite Company, of Indianapolis, and as a result the plant will soon be moved to the home of the Presto products. Despite the removal of the Esterline headquarters to Indianapolis, it is announced that there will be no change in the management of the company. The company manufactures the Berdon system of electric

lighting and has heavy orders booked for its product. It is stated that the firm has also about perfected a combined electric lighting and starting system for automobiles.

BALTIMORE FIRM GROWING.

THE Chase Motor Company, of Baltimore, Md., which operates the only exclusive motorcycle garage in Baltimore, has outgrown its present quarters and is completing arrangements to erect a new garage, with rooms above, the latter to be occupied by the Harley-Davidson Motorcycle Club.

A Striking View of the Indian Plant at Springfield, Mass., Embodying the Recent Extensions.

Five New Pope Salesmen About to Start Out for Practical Road Work. From Left to Right: H. C. Lyman, T. B. Hallburg, T. R. Carpenter, F. L. Hamer and W. B. King, Jr.

INDIAN FORCE AT HEAP BIG POW-WOW

Twelve Hundred Hendee Employees and Two Hundred Guests Enjoy Record-Breaking Outing at the Company's Expense.

FOR excellent reasons, Saturday, September 21, will long be remembered by the 1,200 braves employed by The Hendee Manufacturing Company. On that day the Indians, accompanied by 200 guests, had a grand "Pow-wow" at Riverside Park, on the outskirts of Springfield. Every individual in the factory from the Big Chief, George M. Hendee, down to the shipping room employees turned out for the affair, which was the biggest ever given by a Springfield manufacturing concern.

About 9 o'clock in the morning the Indians assembled at the wigwam and gave their favorite war-whoop. All wore white caps and carried bamboo canes, from which floated Indian pennants, and badges were pinned on with the familiar Indian buttons. Then the twenty-four departments of the factory, forming sixteen divisions, paraded to Court Square, giving many cheers for Big Chief Hendee on the way. The Knox automobile band played industriously and a platoon of police headed the procession. The fair members of the office force rode in automobiles. After marching around Court Square and up Main street to Harrison avenue, the crowd boarded fifteen special cars which were in waiting. On arrival at the park a photograph, with the girls in the center, was taken.

In order that the Indians might not become impatient for the "heap big" feast, sandwiches and firewater were served at intervals. Then the sports were run off, the feature being a tug of war. Sixteen teams entered and several pulled dead heats. After putting forth every ounce of strength they possessed team No. 1, from the Machine Department, nosed a victory from team No. 11, of the Assembling Department. Other events included a 75-yard dash, run in ten heats of five men each; a sack race, five heats of eleven men each; running broad jump, bait casting for accuracy, half-mile race and a three-legged race. Each of the events afforded rare sport, and much rivalry was manifested among the employees of the various departments. Valuable prizes were awarded for each event. R. W. Ellingham was referee of the field events, F. J. Weschler for track events and N. D. Hulett acted as clerk of the course.

After the prizes were awarded all prepared for the big feast. This was held in an enclosure in the park, and soon all the entrances were crowded. When word that the bake was open had reached the outside all the Indians marched to their places at the table, the entire body being seated at one time. It was the largest clam bake ever attempted in Western New England. In order to accommodate the 1,400 sharpened appetites the management of the park had engaged 125 waiters and 25 captains to look after the service. The work of preparing the bakes had been going on since Friday night. There were three different bakes, each being located to the best advantage to serve the crowd.

An idea of Indian appetite may be gained from the eatables necessary to satisfy the bunch. The list is as follows: 100 bushels of clams, 5 barrels of oysters, 1,500 lobsters, 700 chickens, 2,500 ears of corn and 500 loaves of bread; the quantity of brown bottled goods was not given. When the party had been thoroughly satisfied some of the braves journeyed to their homes; while others remained at the park to take in the various amusements.

The foremen of the factory and several members of the office force made up the committees which had charge of the "Pow-wow." Besides feasting them to the limit, The Hendee Company gave all its employees their pay for the day.

AGENTS ARE BUSY

Demand for American Goods Is Growing in Canada, and General Outlook Is Bright.

TORONTO, Can.—The wheels of the Toronto motorcycle trade are still merrily humming in spite of the lateness of "the season." Present indications are that the unprecedented activity will be maintained right up until midwinter, when thoughts will naturally turn to 1913 doings. The turning point will probably be the big exclusive motorcycle and bicycle show which is planned for Toronto next February, arrangements for which are already being consummated. An experienced manager has been engaged for the exhibition, and a committee of the Canadian Motorcyclists' Association is working on the plans.

Wide support has been promised for the event, as the local dealers who control large territories for their commodities are behind the movement in order to have an opportunity to introduce their 1913 products to out-of-town dealers and sub-agents. It is also hoped to induce those manufacturers who are not yet represented in the Dominion to take advantage of the show to introduce themselves to the trade. There is room for everybody in the growing country. It may develop that the motorcycle committee will extend the scope of the show to include motorboats and sportsmen's goods, but in any event motorcycles will form the main feature of the exhibition.

At present Toronto has more than a score of motorcycle agents, but this number is being added to continuously. Three-quarters of these are for American mounts. Several American producers have been looking over the local field lately with the idea of establishing branch factories in the vicinity. It has become known that a certain motorcycle maker, whose name is necessarily withheld, has approached a high official of the Canadian Motorcyclists' Association with an offer to assume the Canadian sales management for the make which is to be assembled on Canadian soil. The second largest bicycle factory in Toronto has also been negotiating with the Reading Standard Co. to handle the R. S. in Ontario next season.

Other facts are as follows: The Canada Cycle & Motor Co., of West Toronto, has just been appointed the Canadian distributors for Spartan belts, made by the Graton & Knight Co., of Worcester, Mass. A. Shuttleworth, of Toronto, has secured the Ontario

Side-Car Built by Edwin H. Bitin, of Harrisburg, Pa.

selling privileges for the fast P. E. M., while W. Porter recently opened up a branch in Toronto of H. Collier & Sons, of London, England, makers of the Matchless motorcycle. Porter expects a turnover of fifty machines in his first year.

H. N. Kirk, secretary of the Excelsior Motor Manufacturing & Supply Co., of Chicago, recently visited Toronto, when he closed with Percy A. McBride, the local Excelsior salesman, for 500 machines for 1913. McBride is disposing of his sporting goods business and will concentrate his attention on the motorcycle and bicycle trade in future.

W. Sabin, representing the Calthorpe Co., of England, is at present on a tour of Canada for the purpose of placing agencies for that machine. Other British firms are also again making a bid for Canadian dollars. In recent trials in the old country, several makers tried out "Colonial" models, which are intended for the Dominion trade. The Colliers are featuring the fact that they are now building a motorcycle with a clearance of $5\frac{1}{2}$ inches under the engine for Canadian roads.

GRYNDYN FOR VALVES.

STEWART & COMPANY, of Broadway and Cortlandt street, New York City, have brought out a ready-for-use valve grinding compound which is the result of a number of years of research. This compound, known as "Gryndyn," is a special mixture of carborundum in suspension and is used directly and continuously; that is, the grinding is begun and finished by Gryndyn only and not by two or more grades of emery or the like. That this is of inestimable value to the motorcyclist in the saving of time in this usually tedious operation, and in not having to take great care that the wrong size of abrasive or grinding powder is not used, should be very evident. The size of the box is such that it is easily recognized by touch and fits practically anywhere on the machine or in the pockets of the rider. The cutting action is very fast and only the worst cases of pitting need be refaced in a lathe, or facer, an advantage not to be had in the use of emery without great waste of time and chances of spoiling the valve-face or seat.

The directions for the use of this compound are generally comprehensive and valuable. In using, a generous coating of the compound is to be put on the valve face, and the valve turned to and fro on its seat in the usual manner. Only three to four pounds pressure on the screw driver or grinding implement is necessary, and a light spring should be under the valve to lift it when a change of grinding position is necessary. After a short time the valve should be lifted clear of the seat and the face cleansed with kerosene and examined, as should also be done to the seat. Leaving a little kerosene on the valve and applying the compound again, grinding is continued as before. This operation is to be proceeded with until all the pits are removed, or until a good surface is produced. The dull finish is recommended as giving the best results and this is obtained at this stage of the operations.

To get a bright or polished finish, having the dull finish, remove the valve and clean its face, leaving the seat as it is. Replace valve and give twenty to thirty turns. Remove and clean valve as before but not the seat. Repeat the operation until the desired finish is had; then wipe both valve and seat.

If a little wood alcohol is used on the cylinder walls, any small particles of carbon will be removed and will not lodge under the valve

face and cause poor seating. Valves with bent stems should be placed in a lathe, straightened and refaced before grinding is attempted. Before commencing grinding operations the fit of the valve in its guide should be seen to be proper, when the formation of the seat and face to correspond can be commenced.

For use in valve grinding, the makers suggest a heavy screw-driver, in default of an excellent little tool, the Owen valve grinder, which is superior to the former. This grinder weighs $3\frac{1}{4}$ pounds and has a channeled handle and circular weighted portion immediately above the blade-shank. It is made of the finest steel and is practically unbreakable under even extraordinary usage. In operation, the end is put in the slot of the valve head and the tool rotated between the hands, its weight giving the proper pressure for grinding. The channels allow of an easy rotation without tiring the operator and ensure this rotation. It is priced at \$2, including a small supplementary spring for lifting the valve, and will fit into any tool box or kit. The Gryndyn comes in screw-top tin boxes which cost 35 cents each.

FREIGHT HEARING CLOSED

Full Testimony Relative to Transportation Rates on Motorcycles Is Now in the Hands of a Commissioner.

CHICAGO, September 30.—Commissioner Prouty, who has been hearing testimony in this city relative to freight rates on motorcycles, completed his work last week and has taken the matter under advisement. His decision will probably be announced at an early date from Washington. The investigation has been conducted by the Interstate Commerce Commission at the instigation of the Motorcycle Manufacturers' Association, this body claiming that there has been a tendency to discriminate against the motor-driven two-wheelers. The rate on bicycles is quite satisfactory, and the manufacturers seek to have this schedule applied to motorcycles also.

The rate for bicycles is one and a half times the first class rate, while the present rate on motorcycles is two and a half times the first class rate. In defending their stand railroad officials assert that motorcycles are more difficult to handle.

DE LUXE SIDECAR.

IN the accompanying photograph is shown the new De Luxe sidecar which is being marketed by the Excelsior Cycle Company, of 166 North Sangamon street, Chicago. The attachment is produced in two styles, both featuring the company's special spring shock-absorbing frame. The De Luxe sidecar lists at \$75.

ON MIDDLE WESTERN TRIP.

CHARLES BROOKS, of the Twentieth Century Manufacturing Company's staff, has left for a two months' business trip in the Middle West and his first bulletins to the factory presage a record-breaking season for Twentieth Century products in this territory.

THE West Side store of the Lister Motorcycle Company in Cleveland, Ohio, has been closed for this season, and all business will be carried on at the main agency on Fifty-fifth street during the winter months.

THE Yale Cycle & Supply Company has closed out its entire stock of parts and accessories, leaving the motorcycle trade in Cleveland.

AFTER RACING HONORS.

THAT the Triumph Motorcycle Company, of Detroit, intends to take an active part in the racing game, was evidenced by the arrival at Toronto of Harry E. Brown and a Triumph racing mount from the factory for the Toronto Motorcycle Club's Ontario championship race-meet at the Exhibition half-mile track on Saturday, September 28. "Jup. Pluv." interfered with the arrangements, however, enforcing a postponement.

Bill Staudt, of the Reading-Standard factory, was on hand for the meet as was a machine from the Flanders factory at Pontiac, Mich.

SABO SOLD OUT.

JOHAN SABO, the South Side motorcycle man, of Cleveland, and sub-agent for the Indian, has disposed of the last of the fifty Indians under his 1912 contract with L. J. Mueller. This was Sabo's first year as a sub-agent. Sabo has patented an Indian motorcycle lock, which is unique in action, fastening the stand to the frame of the machine. He intends marketing the lock at 75c.; nearly two hundred have been sold in Cleveland.

NEW TANDEM MOUNT.

FROM Green's Pattern Shop, 220 Park street, New Haven, Conn., come the unusually interesting photographs reproduced above. They show a new machine which the company contemplates placing on the market at an early date. It will be noted that the outfit embodies some new ideas, and when the design has been refined and tested to the entire satisfaction of its inventors, it will undoubtedly find a ready market among seekers for two-passenger motorcycles.

The four-cycle motor used is of the Green design, with bore of 3 15/16 and stroke of 4 1/4. It carries a steel flywheel, 12 inches in diameter, and develops 7 horsepower. The carbureter is also of special design, and is fully covered by United States patents. It is stated that the machine, carrying two persons, will average 60 miles on a gallon of gasoline, with this carbureter fitted. The machine has a wheelbase of 74 inches and 28-inch wheels with 3-inch Nobby tread tires. From the center of the motor to the center of the rear wheel the distance is 44 1/4 inches. The front saddle is a Mesinger No. 4 and the rear seat follows the lines of those fitted on New Era machines. The outfit weighs 275 pounds complete, with the tanks carrying full supplies, 10 quarts of gasoline and 2 1/2 quarts of oil. Officials of the company are unable to state definitely when the machine will be ready for marketing, but it is intimated that the first lot will soon be under way.

ON HENDEE STAFF.

H. M. SEIBOLD, who has been connected with the C. E. Barr Motorcycle Company, of East Gay street, Columbus, Ohio, agent for the Indian, has taken a position with the Hendee company. After a course of instruction at the factory he will go on the road. J. Otto Tressemer, also connected with the Barr Motorcycle Company until recently, has taken a position in the repair department of the Hendee Manufacturing Company.

RECEIVER NAMED.

COLUMBUS, Ohio.—A. F. Rohmer has been named as receiver for the A. B. & B. M. Howell Co., 185 South High street, Columbus, former agents for several lines of motorcycles. The application was made by A. B. Howell, who asks for a dissolution of the partnership. The assets are given at \$10,000 and the liabilities at about \$5,000.

SHOW SPACE IN DEMAND

Many Applications Have Been Received from Prospective Exhibitors for Big Chicago Display.

THE Chicago Motorcycle Show, under the auspices of the M. M. A., will be the first national show of its kind ever held in this country, and, while bicycles will be included, the exhibition will be practically an exclusive motorcycle show. Application blanks for space have been mailed to all likely exhibitors, and applications are coming in at such a rapid rate that the show is assured of hitting the high-water mark.

All applications for space should be mailed to J. S. Vogel, 116 S. Michigan Avenue, who has been chosen to manage the exhibition by the M. M. A. Show Committee. The exhibition spaces will be rented at 90 cents per square foot. This includes all fixtures, light and other necessities. The general admission price will be 25 cents. The opening evening of the show will be for dealers particularly, and manufacturers will send out compli-

SPEAR ON THE ROAD.

DEALERS in New York State will be pleased to greet William R. Spear, representing the Reading-Standard Company, Inc., who is covering that territory on his twin mount. He started from Newark, N. J., on September 30, and will cover 2,500 miles of

Empire State roads before November 1. Spear says that 1913 prospects are the best ever, and he has just closed agencies for all of Greater New York and Westchester County and Eastern New Jersey.

mentary tickets to all dealers applying for them. It is expected that there will be present on the opening night more than a thousand dealers from all parts of the country.

The show will open to the public at 6 p. m. on Monday, February 3, on the second floor of the Manufacturers' Exhibition Building at 1319 Michigan Avenue. It will continue until 11 p. m. on February 8. The automobile show will open up about the same time, and there will be a huge electric sign across the street from the Coliseum entrance, calling attention to the motorcycle show, just about a block to the east.

NEW MERKEL AGENT.

L. H. SILSBY, of Cleveland, Ohio, who conducts a motorcycle repair shop at 5406 Detroit avenue, has been appointed agent for the Merkel in Cleveland and northern Ohio.

MANY MACHINES STOLEN.

THEFTS of motorcycles in Cleveland have become so common that the chief of police has issued weekly bulletins to all officers to be on the lookout for the stolen mounts. Riders are being stopped daily by officers, who examine their machines. Several machines have been recovered in this way, while a few have been found abandoned on country roads.

NEED NEW HEADQUARTERS.

A COMMITTEE appointed by President McConnell, of the Cleveland M. C., is on the lookout for new club-rooms. The club has been holding its meetings at the club-rooms at Luna Park, but since the closing of that amusement place other quarters are needed. A permanent location in the central part of the city will probably be obtained.

RIDERS GO TO ST. LOUIS.

AFTER the close of the Cleveland motorcycle drome, Gibson, Glenn, Carslake and Armstrong pulled stakes and left for St. Louis, where they are to perform on the boards at the new quarter-mile saucer under the same management as at the Cleveland track.

BIG COLUMBUS MEET.

COLUMBUS, Ohio.—Arrangements are being made by a number of motorcycle dealers and riders to give a race meet on the dirt track of the Columbus Driving Association on Sunday, October 13. It is proposed to have eight events in all, the feature being an hour race. There will be races for singles and twins and for professionals and amateurs under the new classification of the F. A. M.

COLE AT HIS BEST

Toronto Youngster on a White Thor Lowers Record for Exhibition Track in Recent Meet.

TORONTO, Can.—Harold Cole, the sensational Canadian racer, set a new record of 6:14 for five miles for the Exhibition track, Toronto, at a race meet held there on Satur-

Bill Staudt on His Reading Standard at Toronto Race Meet.

day, September 21. Cole piloted a white Thor. The oval was in the best condition it has ever been in, being as hard as concrete and carefully oiled, and if it had not been for a gale that was blowing, he would probably have covered the distance in ten seconds less. Cole also won a ten-mile race and was opposed on both occasions by Bill Staudt, of the Reading Standard factory. In the long event, Cole only won by a fraction of a second, in the fast time of 12:37½, while Staudt led for the greater part of the time in the five-mile clash.

Bob Scott, the coming Indian rider of Toronto, took the five-mile race for amateurs in 6:45 from F. Miles, Indian, whom he only beat by a machine length. This was Scott's seventeenth victory this season. About five thousand persons witnessed the races, which were of the sort that causes heart palpitation.

ABERDEEN ROAD RACE.

A ROAD RACE, covering 119 miles, from Aberdeen, Wash., to Centralia, was recently pulled off under the auspices of the Aberdeen Motorcycle Club. Large crowds thronged the streets of the towns through which the racers passed. At some places they were able to make 60 miles an hour and the speeders furnished plenty of excitement from start to finish. Everett Lodbell (Indian) and Aubrey Archer (Excelsior) were the chief thrillers; Lodbell crossed the tape only 30 seconds ahead of Archer. R. E. Barnes (Indian) was third. Time, 3:13:30.

SHORT GRASS MEET.

A MOTORCYCLE race meet was held in Salina, Kan., under the auspices of the Short Grass Club on September 28. There were eight events, two for amateurs and six for professionals.

HOWARD L. COLE, of Jackson, Mich., spent his vacation touring from Jackson to Baltimore, Md., on his motorcycle.

THE BENNINGS SITUATION.

EDITOR MOTORCYCLE ILLUSTRATED:—Having noticed a letter in the September 19 issue of MOTORCYCLE ILLUSTRATED written by Mr. Frank Long, I wish to state that Mr. Long's ideas and statements in regard to Bennings racetrack, in Washington, D. C., and regarding the riders who participated in the races on Labor Day are erroneous and very much exaggerated, and I wish to say the following:

The track was in perfect condition on Labor Day, being well oiled, and the only spot of sand was on the upper turn, being only two inches deep instead of from "ten to fifteen inches deep," as he states.

The statement that "one man in particular who rode in the races gave his word in writing that he would stay with the other boys in any decision reached," is incorrect, as I have had a personal interview with every rider who raced on Labor Day and they state that they did not agree verbally or in writing to take any special stand.

The statement that the four riders who started were novices, using long handlebars and just off the streets, is also incorrect. Seven riders started in the 10- and 15-mile races and three of the machines were equipped with racing handlebars. Among the starters were Mr. Mangold, the best rider in the District of Columbia, who has been racing for the last five years; Mr. Marsh, who has been racing for the last three years, and Mr. Myer, who is out of the novice class and who has been racing over a year. The races were run off in a very satisfactory manner, the prizes for the first race being gold and silver medals; for the second race, a \$25 first prize and a \$15 second prize, and for the third race, a \$25 first prize and a \$15 second prize. If Dr. Thornley or one of his representatives should ever visit Washington and inspect Bennings I am sure he would think the same as I do.

GEORGE T. COCHRANE,
President, Washington Motorcycle Club.

TULLIS 100-MILE WINNER.

DAYTON, O.—More than five thousand enthusiastic fans attended the 100-mile race which was recently pulled off on the local fair grounds under the auspices of the Dayton Motorcycle Club. It was the first race of its kind in this vicinity.

The program opened with a five-mile race, which was won by Mumma (Indian); with Malloy (Thor), second, and Reichel (New Era), third. Dave Tullis, of Kenton, won the 100-mile open race in 2 hours and 18 minutes. Evans (Indian) was second and Bascom (Thor), third. Irvin Jacobs, who made the 100 miles without a stop, came in fourth. On August 4 Tullis was the winner of a 100-mile race at Fort Wayne on a mile dirt track, his time being 119 minutes.

RACES AT COUNTY FAIR.

FOUR motorcycle races were staged at the Westmoreland County Fair, Youngwood, Pa., September 12-13. About 10,000 people witnessed the events. Ten and 15-mile races were scheduled for the first day and both were won by George Roth, riding a 4 h. ported Indian. His time for the 10 miles was 13:18, and for the 15 miles 20:19½.

HARRY GOODE, a salesman for the Flanders, recently put his machine to a severe test by riding through the Platte Canyon, in Colorado.

A CROWN POINT SPEEDSTER.

IN a meet held at Crown Point, Ind., on September 15, Art Henderlong, mounting an Indian, lowered the track time from 1:16 to 1:07 for the mile. Steve Barzo, a Gary rider, in trying to hold Henderlong's pace drove his white Thor racing machine into the fence and broke his right leg in two places. Henderlong, who is the local star, has taken every race but one on the Crown Point track this season. In the 10-mile event at the recent meet Mike Hershberg, using Henderlong's racer, won in 12:07, with Ballard, Thor, second in 12:52. The Henderlong racer is not a special factory machine, but one which the boys have trimmed up for extra speed. It is explained that Henderlong's time of 1:07 was really for one mile and 900 feet as the track, which is rated at half a mile, is slightly oversize.

FREDERICKS DEFEATS BOYD.

DENVER, Col., September 22.—"Slivers" Boyd and Fredericks were hooked up in an interesting race here today over the 25-mile route. Fredericks took the lead for the first 10 miles, when he was displaced by Boyd for the next five miles. For the last 10 miles the riders were elbow to elbow, but Fredericks nosed out at the tape.

Jim Cox and Harry Swartz rode abreast in the five-mile event to within 100 feet of the tape, when Cox managed to gain a few inches which he carried over the line. The match race between Balke and Edward Swartz was a hummer. There was plenty of jockeying before Balke managed to shake his opponent in the seventh mile. Then he cut out and took a lead of a third of a lap. To close the program Balke attempted to lower the track record of 39½ for the mile, which he set two weeks ago, but was unsuccessful.

A FLANDERS DAY.

THE St. Augustine Machine Co., Flanders agent in St. Augustine, Fla., writes as follows concerning a recent race meet on the beach: "Flanders machines romped off with first, second and third places in the 5-mile event and took first and third places in the 10-mile race. In the 20-mile event we landed a second."

A PITTSBURGH MEET.

THE Pittsburgh Press will conduct another motorcycle race meet on Saturday, October 5, at Schenley Oval, Pittsburgh. The program will include five events. Schenley Oval is an excellent half-mile dirt track, banked somewhat at the corners.

C. R. Burbanks, of Dover, N. H.

THREE CLEAN SCORES IN TORONTO RUN

Heavy Rain Crimped the Schedule for Some Over 191-Mile Course, but Seventeen Riders Finished Out of Twenty-three Starters.

TORONTO, Can.—The annual reliability tour of the Toronto Motorcycle Club for the Dunlop Tire trophy was held on Saturday and Sunday, September 28 and 29, with twenty-three riders indulging. The route was carried through Eastern Ontario over a 191-mile course, the main objective points being Peterboro and Cobourg. Four Harley-Davidson stalwarts came prepared for a clean-up, and they accomplished their purpose, two of the Milwaukee machines, with C. H. Russell and F. Rayney up, taking two of the three perfect averages and the other two being penalized only five points for slight mechanical defects. The third grand slam rider was Herb Greenwood, on an English Triumph. Four automobiles accompanied the riders to carry the officials for the run and to transport supplies.

Perfect weather was enjoyed on the first day, so that every contestant arrived at the night control at Peterboro, 90 miles away, with a straight record. Everybody in Peterboro that night knew of the presence of a bunch of riders in the town, as the boys cut things loose all over the place. The tourists were stirring again at daylight on the second day for some more fun, as they had to fill in the time until breakfast was served at 7:30. A number took a side trip at this early hour to visit the canal and lift lock which has made the place famous, and it was not until 8:45 that the officials ordered the start for the second leg of the trip. The bunch ran into a secret control exactly twenty miles outside of Peterboro, near Bewdley, but only a few had their wings clipped, as the margin of 1½ minutes each way was allowed. The noon control at Cobourg was reached on schedule time shortly after eleven o'clock, when a number of non-contestants who had come out from Toronto to meet the run, joined the cavalcade. Dinner was served at the Dunnham House by Mine Host Green, after which the final section of the tour was started at 1:30 with an 18-mile speed limit.

Soon after leaving Cobourg, the riders were stopped at a toll gate, which was conducted by a female official, and they there paid the usual fare, although the officers of the club had also paid for the whole party beforehand. When this was learned, Alex. McLean, of the Touring Committee of the club, went back in a car and demanded the refund of half the contributions, which he was finally given after some argument. The road was a good one, however, and the riders would not have objected to being held up because of the fine riding afforded.

Until within twenty miles of home, the ride had been a merry jaunt, but at this juncture storm clouds loomed up, and the rain fell in torrents, causing many perfect scores to be shattered in short order. Several beat it for home, including one or two of the official cars, but the remainder stuck to the job and finished as near to schedule time as greasy roads would permit.

A tally of the machines at the finish showed that the following makes made the trip: Five Indians, five English Triumphs, four Harley-Davidsons, four Excelsiors, two N. S. U.'s, one Merkel, one P. E. M., and one Budget-Whitworth. An English Douglas also started, but a broken belt caused a retirement.

The run was attended by many unusual incidents. The Harley-Davidson team looked like

winners from the start, as each man came with a watch on his handle-bar and a cyclometer on the front wheel. With one eye on the watch and the other on the cyclometer, each Harley rider never swerved from schedule time, and their watchfulness won the day for them.

Greenwood, the perfect scorer, lost five spokes from his Triumph near Peterboro when he was shot from the road by a frightened horse, but he commanded one spoke each from the other four Triumph machines and finished on time.

Two riders took passengers in sidecars and succeeded in finishing well to the front. Dr. W. B. Wurtz piloted an Indian T. T. seven and car in which sat A. M. Phillips. W. Luccock used a Merkel 6 and sidecar, and also kept up with the van. The passenger machines made good time on the muddy roads during the final dash for home.

One mile out from Peterboro, A. Thomas, Excelsior, went through a small bridge into a deep ditch, and he and his machine had to be pulled out by the pilot car. In spite of his experience, he continued and completed the route.

The magneto on E. J. Banfield's Triumph shorted one mile from the home control when he was running on time, and it took him half an hour to remove the trouble. His brother, Will Banfield, Triumph, also sacrificed a good score by remaining with him to help.

The following were the scores:

	Points.
H. Greenwood, Triumph.....	1,000
C. H. Russell, Harley-Davidson.....	1,000

UTOPIA CLUB RACE.

BROOKLYN, N. Y.—The keen rivalry which has existed among the members of the Utopia Motorcycle Club of this city resulted in a five-mile handicap race on Sunday, September 29, on the Long Island Motor Parkway. It was agreed that the loser should provide a dinner for the rest of the contestants, and this resulted in an exciting race. Five entries were received for the event.

John Doeffer, with 15 seconds handicap, won the event in 4 minutes 50 seconds. He was hard pressed all the way by William Pflieger, who had the same handicap, and Doeffer won by only half a wheel's length. Ed Daly, with half a minute handicap, was a good third. James Frederick on scratch, the last man to finish, had to pay for the dinner, which was "some blow-out."

A TORONTO TOURIST.

J. C. RICHARDSON, of 72 Henry street, Toronto, who appears in the accompanying photograph on his Emblem, is one of the most active enthusiasts in the Canadian metropolis. He has made some long trips into little-known territory during the past summer and as a result he is a booster for good roads.

FOUR WITHIN TIME LIMIT

Rain Cut Down Big Field in Worcester Endurance Run Leaving Only a Quartet to Finish on Schedule.

WORCESTER, September 30.—Four riders finished within the time limit in the 24-hour endurance run of the Worcester M. C., which was started at 7 p. m. on Saturday, September 28. There were six teams of four riders each, three Indian, one Thor, one Harley-Davidson, one Excelsior and fourteen individual entries. The course was from Worcester to Providence to Boston and return to Worcester, a distance of 135 miles, on a 15-mile an hour schedule; then from Worcester to Springfield, Pittsfield, Albany and return to Worcester, a distance of 305 miles, on a 22-mile an hour schedule. Rain fell steadily from 9 a. m. to 3 p. m. on Sunday and many riders quit at Pittsfield on the out trip rather than plug the mud.

The four riders who finished within the time limit were Glen Crandall, of Boston. Thor; W. J. Walker, of Danvers, Harley-Davidson, two minutes late at Albany; W. F. Mann, of Boston, Thor, five minutes late at Albany and 19 minutes behind at Worcester; Johnson, of Worcester, Indian, penalties not known. Another Harley-Davidson rider covered the course and finished at 2 a. m. Monday. The roads were mostly macadam, but they were quite muddy on the return trip. A. C. Kennedy was quite seriously injured when he crashed into a stone buttress at a right-angled turn under a railroad bridge during the night.

FIRST PRIZE FOR STEVENS.

AT a meeting of the endurance run committee of the New Jersey M. C., of Newark, N. J., Wilber Stevens, of the Yale team was declared the winner of the special gold medal for the most consistent riding in the club's 24-hour run held September 14-15. He had a total of 995 points out of a possible 1,000. George Reichy, also of the Yale team, was awarded the second prize, a silver cup, his total being 973 points.

SOLUTION OF THE LIGHTING PROBLEM

(Continued from page 44)

of the paraboloid. It is thus possible to focus for a far reaching beam of light, a diffused illumination, or illumination directly in front of the machine. Reference to Figure "B" will illustrate the possible focal adjustments.

It must be remembered that only those rays of light at the geometrical focus and thrown on the reflecting surface will be projected parallel to the major axis of the paraboloid.

When the lamp is at 1, the geometrical focus of the paraboloid, the reflected rays of light are parallel and a far-reaching beam of light is projected directly ahead. The usual geometrical focal length in an electric headlight varies from $\frac{7}{8}$ inch to $1\frac{1}{4}$ inches. By shifting the lamp to position 2 a diffused light is projected ahead, and the entire roadway is illuminated. If it is desired to have a short focal length the lamp may be placed in position 3.

This will have the effect of projecting the beam of light directly in front of the machine. The focal length is easily adjusted by means of a thumb screw, as shown in the illustration. This feature of the electric lamp has advantages over the acetylene type of lamp, in which the burner is permanently fixed relative to the focal length. Another desirable feature of the electric system is that it is unnecessary to dismount to light the lamp, as a

switch may be very conveniently placed on the handlebars and operated at will.

Source of Current.

The electric headlight for general illumination requires a two-volt, 18 to 20 ampere hour battery, with jelly electrolyte. This battery requires a space of about 3 x 3 x 6 inches. Its small size makes it convenient for storage in the tool box of the machine. The lamp used is usually a 4 c. p., 4-watt wire-drawn Tungsten, taking two amperes. One charge of the battery will give current to the lamp for about 8 to 10 hours of steady light.

The difficulties formerly experienced with carbon filament lamps, which continually gave trouble, due to the filaments breaking, have

been entirely overcome by the wire-drawn type of lamp. The gas generator possesses certain advantages over the electric battery, chief among which is the longer period of reliable light. A good generator will give light approximately four times as long as the electric battery, and it also indicates when the charge needs renewing. The gas generator, however, requires more room for stowage, and its weight is slightly in excess of the electric battery. A good scheme to follow is to have two systems of lighting on the machine, so that in case one fails there is still another one to fall back on. Experienced tourists are rapidly taking up this idea, and fitting a good gas lamp as well as an electric outfit on their machines.

THE NOVEL BRADLEY.

DESIGNED along the lines of the de Dion and Peugeot racing-voiturette motors, the duplicated-valve Bradley single-cylinder motor, made by the Bradley Motor Works, of Diamond street, Philadelphia, affords an un-

usually interesting power plant. The motor, which has been tested on the track at Point Breeze, is of the L-head type, but the exhaust valves only are in the chambers. These valves operate simultaneously, and the gases pass out at front and rear of the cylinder. The inlet

valves, also duplicated, are located in a chamber in the head and operated together by rocker arms and push-rods as in ordinary overhead construction. There are no cooling flanges fitted to this head, but the explosion chamber has six rows surrounding it. In the racing machine, the motor is mounted so as to incline slightly forward and the drive is by direct chain. The machine in the picture is known as the "Lightning Bradley" and is mounted by William Hollenbeck, the well-known Quaker City professional.

LEAVES SPLITDORF COMPANY.

P. J. G. KELLY, for many years associated with C. F. Splitdorf in the conduct of his large magneto and ignition business, has severed his connection with the Splitdorf Electrical Co., of New York City. Mr. Kelly's connection with the Splitdorf interests dates back nearly a dozen years and his retirement comes as a surprise to the trade. Mr. Kelly has no definite plans at present for the future and will take a much needed rest before returning to the industry when he will, it is rumored, be connected with another well known electrical concern.

CASINO COMPANY'S NEW HOME.

WORK is being rushed on the new home of the Casino Cycle & Supply Company, of Columbus, Ohio, in order that it may be occupied before the cold weather sets in. The new establishment is entirely of brick and affords far more spacious quarters than the old store. A new and complete repair shop is being installed, together with a neat salesroom and offices.

A MEETING has been called by the motorcyclists in Kewanee, Ill., for the purpose of forming a local club.

Repair bills—their most common cause.

Recently we made a canvass of repair shops in New York.

We asked the question: "What share of the gas engine troubles that come to you are caused by poor lubrication?"

The answers ranged from "one-third" to "70%."

Probably every owner of these damaged motors thought he was using a good lubricating oil.

As a matter of fact, oils that yield efficient lubrication are rare. And their wearing quality is often overlooked.

A worn-out oil ceases to lubricate.

Then comes trouble—pitted and burned-out bearings, "frozen" pistons, scratched cylinders, and even broken parts.

You cannot watch the lubricating process in your wrist pins, bearings and cylinders. But you can be sure of this—

An oil that is wearing poorly, is lubricating poorly.

Gargoyle Mobiloils were produced after careful study, by the world's authoritative leaders in scientific lubrication, the Vacuum Oil Company.

In wearing quality, few motorcycle lubricating oils on the market even approach them. We speak from experience. You can demonstrate it for yourself.

Though not low priced, in economy and lubricating efficiency we can safely say that Gargoyle Mobiloils stand alone.

Our chart of recommendations (printed on the right) shows the correct grade of Gargoyle Mobiloil for each make and model of motorcycle.

A grade for each type of motor

The various grades, refined and filtered to remove free carbon, are:

Gargoyle Mobiloil "A"

Gargoyle Mobiloil "B"

Gargoyle Mobiloil "Arctic"

They are put up in 1 and 5-

gallon sealed white cans, in half-barrels and barrels.

All are branded with the Gargoyle, which is our mark of manufacture.

They are handled by the higher class garages, automobile supply stores, and others who supply lubricants.

This list shows the right oil for your motorcycle.

Explanation: In this schedule the letter opposite the name of motorcycle indicates the grade of Gargoyle Mobiloil that should be used. For example, "A" means "Gargoyle Mobiloil A." "Arc" means "Gargoyle Mobiloil Arctic." Recommendations cover all types of the same make unless otherwise stated.

GIRL RIDER AT DETROIT

Miss "Cy" Woodman Figures in Another Spill and Court Proceedings But Continues Toward Windy City.

FROM Rochester—the last point at which you heard from me—I rode to Buffalo. There I was entertained at the Yacht Club and given a toolbox nicely equipped and a brass Buffalo was bolted onto my machine for good luck. From Buffalo I took a run to Niagara Falls; this road is poor going. The road into Erie, Pa., was good, considering the heavy rains. Right here I stopped and picked up a little puppy, so young it hadn't its eyes open and I had one awful time trying to persuade some folks to take care of it. One sees any number of signs along the road reading, "Go Slow," and about half a mile further on one reading: "Thank You."

In Cleveland I was presented with a pennant designed especially for me and inscribed: "Cy. Woodman, N. Y. to Frisco." One of the city newspapers came out with a supposed interview, where I was quoted as hurling a brick-bat at my sex. At Cleveland I took the steamer to Detroit, Mich., to go out from there to Pontiac, the birthplace of my Flanders 4. The new twin model was sent out to meet me with a number of 4's. On my return trip into Detroit that evening, going through Royal Oaks, I struck three miles of almost impassible road and was told by one of the councilmen of the town to ride on the sidewalk. I was riding slowly and everything was going along smoothly, when without a moment's warning a man jumped out from behind a tree, threw himself against my machine and knocked me over into the road, shouting, "You'll not ride on this walk." He claimed to be the sheriff, but couldn't show his badge. He didn't have one to show. I was about all in when a "gentleman" appeared on the scene. Leaving him to guard my machine, I walked back into the village and telephoned for the real sheriff to come and get my man, which he did. I had the extreme satisfaction the next morning of seeing him pay \$42.13 for his evening's sport. It developed, as I thought, that he did not want anyone to use his walk to ride on.

Two M. D.'s and a Doctor of Osteopathy, who offered her services, fixed me up. My arm is still bandaged and the vibration from the handlebars does not help any. I have been held up five days and if many more delays occur I'll land in 'Frisco about in time for the Panama Exposition in 1915. A race committee extended an invitation to do a mile on the State Fair Track at Detroit, where they pulled off an automobile race, but I declined. The record for the track is a mile in 47 seconds. My record is 47 miles in an hour. Just now that is plenty fast enough for me. I was given an electric flash light before leaving the city. It has been very cold out here for the last week; heavy frosts with the thermometer registering thirty.

"CY" WOODMAN.

THE first annual reliability run of the Ohio State F. A. M. will take place October 11-13. Jesse Campbell, State F. A. M. commissioner, has laid elaborate plans for the run and it is expected to be the liveliest event of the season.

RACING CALLED OFF.

NEWARK, N. J., September 30.—Advertisements announcing motorcycle races at the motordrome raised such a storm of protest from residents in the Vailsburg section that Manager Paul Derkum decided not to attempt to run them yesterday and a foot race was put on instead, the public being admitted free.

A four-foot wire fence has been placed at the top of the Newark bowl, lying almost horizontal to the perpendicular wire fence which was intended to safeguard spectators, and Chairman Thornley of the F. A. M. competition committee, after viewing the improvement expressed the opinion that the track is the safest in the country. Racing has now been called off for the season on the bowl, but the management counts upon starting it early next year. Ray Peck and the other Western riders have left for their homes.

A BROOKLYN ENTHUSIAST.

W. B. BLEE, a Brooklyn (N. Y.) oculist, who is also a full-fledged sidecar enthusiast, appears in the accompanying photograph with his wife and child. Blee uses an Indian machine and Simplex sidecar, and has

experienced no trouble in making trips of considerable length into the country, with his outfit loaded as in the picture. He is of the opinion that the professional man who is confined the greater part of his time, and unable to take other exercise, will derive more pleasure and healthful recreation from proper use of a sidecar than in any other way.

SIDECAR TRIP TO BOSTON.

UP Toronto way everybody is talking about the new 1913 Indian models. There are many rumors concerning spring frames, spring saddle posts, three-inch tires and the like, but Herb Kipp, the Hendee Canadian salesman, will not say a word.

The Kipp family, including Mr. and Mrs. H. W. Kipp, and Mr. and Mrs. H. M. Kipp, have just returned from a sidecar trip to Boston and return, the two ladies occupying the "bath chairs" attached to the T. T. seven Indian mounts. Fine weather and excellent roads were encountered on the outward bound trip, but on the return journey the roads has been torn up in a great many places as is usual in the fall.

CLEVELAND'S QUICK DELIVERY.

A MOTORCYCLE quick delivery company has been launched in Cleveland for the second time. The first company did not make a success of the business. This time two of Cleveland's oldest riders, A. C. Schrieber and H. H. Huntsberry head the company. Twin Indians are to be used with side delivery vans.

CONSTANT'S TALE OF WOE

Brooklynite Made Big Jumps in the West But Couldn't Find a Dry Spot.

WHEN Johnnie Constant, premier speedster of the amateur division, drifted back into New York a few days ago after a road tour he was nursing a well-developed grouch, and not without reason. Constant went out to Milwaukee to participate in races scheduled for the State fair, but trotting enthusiasts monopolized the track on the first day set for motorcycle racing until it was too dark to ride with safety. A conference was held in which Constant, Don Klark, State Referee Carpenter, William Harley, of the Harley-Davidson company, and other riders and promoters participated. It was decided that the fair management had given the motorcycle boys a flabby deal, and it was forthwith announced that the racers would not compete at the track on the following day. What's more the whole affair has been called to Craiman Thornley's attention and the Milwaukee fair management may not be given another sanction.

And that wasn't all. From Milwaukee Constant jumped to Marshall, Minn., to put in a few days shooting prairie chickens, but he hadn't seen a chicken—prairie or otherwise—before he was wired to compete in races at Madison, Wis. It was a hop of 566 miles, but the Brooklynite made it. Then it rained. And rained. Constant jumped to Chicago for races scheduled there. But it rained. Then he hustled off to Toledo for a big meet. And it rained again. "S' enough," said the Brooklyn speedster and he returned home, arriving in New York during a shower.

CAMPBELL'S NEW STAFF.

JESSE CAMPBELL, of Dayton, State Commissioner for Ohio, has been hitting only the high spots of late in his campaign to boost the F. A. M. organization in Buckeye territory, and that he is getting results is indicated by the following list of newly appointed county commissioners:

Erie County: Edw. C. Hinkey, 401 Market street, Sandusky; Richland County: Fred Dippman, 22 Willow street, Mansfield; Marion County: G. F. Lentz, 226 East Center street, Marion; Hamilton County: Walter S. Browne, 503 Neave building, Cincinnati; Muskingum County: Perry D. Gath, Wedge Garage, Zanesville; Crawford County: A. G. Flannery, Galion; Shelby County: Paul Monroe, 105 Court street, Sidney; Seneca County: F. A. Copley, 134 Centre street, Fostoria; Fayette County: S. J. Van Pelt, care Maxwell Auto Livery, Washington C. H.; Loraine County: Hart A. Dickason, 345 Broad street, Elyria; Franklin County: C. E. Livingston, 527½ Fourth street, Columbus; Ross County: Walter W. Brust, 511 Allen street, Chillicothe; Montgomery County: Carl Coppel, 123 East Fifth street, Dayton; Summit County: C. B. Mitchella, 179 Gale street, Akron; Champaign County: John K. Hendrickson, R. F. D. No. 5, Urbana; Miami County: W. O. Lane, 19 South Cherry street, Troy; Clarke County: Chas. T. Henderson, 36 South Limestone street, Springfield; Clinton County: Jack W. Vance, Wilmington; Stark County: H. F. George, 1316 East Lake street, Canton; Morrow County: Ivan Schench, Cardington; Licking County: E. R. Francis, Granville street, Newark.

SEARCHLIGHT No. 102, showing back closed.

20TH CENTURY Points of Superiority

- 1—**CONSTRUCTION:** Built of heavy gauge brass, riveted throughout. So solidly made as to withstand the hardest kind of use—no jar will ever put out the light.
- 2—**DESIGN:** The lighting principles and design used in the big naval search-lights have been followed in 20th Century Lamps—a strong, powerful ray is thrown **directly ahead** (the danger point). Best 4-in. mangin mirror lens, well focused.
- 3—**SPECIAL FEATURE:** The "open-door-to-the-lens" feature is peculiar to 20th Century Lamps and is a decided advantage. It permits of easy access to the lamp interior for cleaning purposes.
- 4—20th Century Generators—like no other generators on the market—have a **Special Locking Device** that insures gas-tight lamps always, but which also insures easy locking and unlocking. **No screw threads to tighten or corrode.**
- 5—20th Century Bicycle Lamps are lamps that will **really** keep lighted. They are always up to the same standard of excellence.
- 6—**RELIABILITY:** Over 20 years manufacturing lamps is your guarantee for **Reliable lamps.**

Jobbers write for new terms and prices. Also ask for cuts for your catalogue.

20th Century Mfg Co

420-422 Ogden St.

NEWARK, N. J.

BICYCLE LAMP, Model No. 2.

Perfect Transmission

To be worthy of "perfect," the transmission must be consistent all times. It by neither heat nor moisture, nor conditions. It strength to withstand the hardest kind of usage, into its construction materials of such the most extraordinary abuse will only sustaining power.

the term "permitting gear" should be affected nor cold, dryness any other outside must have ample stand the hardest and, above all, tion must enter a character that ordinary kind of tend to prove its ers. That is why

"The Coventry" CHAINS

are almost universally conceded to most closely approximate the condition "perfect."

Strength Endurance
Speed Silence

These four qualifications have been solidly built into "The Coventry" Chains. From the raw bar of material to their finished state, excellence of material and conscientious workmanship guarantee to you, the user, the highest perfection any transmission can attain.

Our catalog is both instructive and interesting. Write for it.

"During the past seven years I have used all makes of Tires and find Continental-Erie the best"

CONTINENTAL RUBBER WORKS, Erie, Pa.

Chicago, Ill., August 14, 1912.

Gentlemen: Just a line to let you know what I think of the Continental-Erie Motorcycle Tires. I have been riding a motorcycle for the past seven years and during that time have used all the leading makes of tires. I have never found any tire that has given me the service that the Continental-Erie Motorcycle Tires have given me. At the present time I have a pair of these equipped on my machine that I have used for over 4,000 miles, the majority of this distance having been ridden with a tandem attachment and another party on the machine over country roads.

These same tires I have also used in Race Meets and Endurance Runs and they have never given me any trouble.

Continental-Erie Tires are without question the very best tires that I have ever ridden. They having a very tough and resilient tread, make a very easy riding tire and they have always given me excellent service.

Wishing you continued success with your tire, I am, very truly yours,

B. M. BLANKENHEIM.

NON-SLIP-LAG

The new lining for pulleys. It absolutely prevents belts from tearing and slipping; increases their life and affords additional power. Non-Slip-Lag can be applied without removing Belt or Pulleys. No Screws or Metal Parts are required to hold Lag on Pulley. Non-Slip-Lag is now being used exclusively by the Eclipse Machine Co., on the Eclipse Free Engine Pulley.

THREE CENTS A WORD

¶ A tire is only as strong as the weakest point in its construction.

¶ This is a fact we realized and watched when we first designed the

DIAMOND

29" x 3"

Motorcycle Tire

¶ We built a tire in which there were no weak points—built it with the kind of material and the kind of workmanship which could mean nothing but strength in the finished tire.

¶ We were the first to build a motorcycle tire as a small automobile tire, and are the only manufacturers who insert a breaker strip between the fabric and tread to properly distribute the shocks to which a motorcycle tire is subject.

¶ Service and safety are what this tire means to the rider. Booklet describing all our motorcycle tires on request.

Jeffery-Dewitt Porcelain Triumphs Again

¶ It takes a hammer to crack a J-D Porcelain. Heat can't do it. Every claim to the superiority of this product has been vindicated—and more—by a new experience. A great motor car factory burned to the ground on the first day of last June. It was the fiercest conflagration ever recorded in the automobile industry. Heavy brick walls crumbled like cardboard; steel rails

twisted and curled like glowing serpents along the ground; immense steel girders bent and writhed in the flame; piles of aluminum castings melted into a white hot pool. When the fire had burned itself out, nothing remained but the smoking wreckage of a plant and stock worth half a million.

¶ Workmen started in to sort out the junk. Twenty-seven cars ready for shipment had been standing on one of the floors. Their scarred skeletons were found deep in the wreckage, where the flames had been hottest.

¶ Every motor had been equipped with J-D Spark Plugs. Not a single Porcelain was cracked!

¶ The case-hardened steel of the plugs had no more temper left in it than a piece of putty. The brass caps were melted off. But not a porcelain had suffered a bit of damage, beyond having the enameled lettering half burned away, as is shown in the photograph.

¶ This same quality of porcelain enters into every spark plug produced by the Jeffery-Dewitt Company. When you buy spark plugs again buy the best—the J-D line—the kind that defy heat, besides being carbon proof, soot proof, oil proof. Satisfaction guaranteed or your money back.

¶ Write for our motorists' classic: "Ignition and Spark Plug Talk." It's full of good pointers and timely information. A new edition is just off the press.

"Whitney" Chains Are Built For Strains

Every "Whitney" Chain has a reputation back of it, a reputation of having been tested in the most trying service and never failing to make good. We've made chains for years and through our untiring efforts to produce nothing but the best our chains have gained a remarkable reputation. You can't go wrong by placing a "Whitney" on your machine.

When making replacements insist on a "Whitney" and get acquainted with its merits.

Motors DeLuxe

Superiority Wins!

Eight months ago we announced to the trade for the first time our now famous line of DeLuxe Motorcycle Motors. Today many prominent motorcycle manufacturers are using DeLuxe motors and they are the most talked of sensation of the present season.

Why?

Because of the following noteworthy features, some of which are:

- One Piece Crankshaft.
- One Part Crank Case with Cover.
- Improved Cam and Magneto Drive.
- Oil Tight Motor.
- Positive Oiling System.
- Silent Operation.
- Simplified Design Throughout.
- Reduced Number of Parts.
- High Power Development.

Voters! Attention!

READ THE EMBLEM'S PLATFORM

THE EAGER EMBLEM

READ THE EMBLEM'S PLATFORM

As a candidate for the office of the Ideal Motorcycle, the EMBLEM herewith gives its platform:

- 1st: To serve its rider with unswerving strength and fidelity.
- 2nd: To be free from any and all imperfections.
- 3rd: To have in full measure strength, speed, simplicity, comfort and durability.

Vote for the EMBLEM. It has already served long terms honorably and well. Its last achievement was the transportation of Mr. and Mrs. Gale across the continent, through the deserts of Arizona, the wilds of Wyoming, the mountains, the hills, the sand, the mud, the water; the thousand and one conditions existing between Angola, N. Y., and Los Angeles, Calif., a journey second to none for its constant strains and hardships. The EMBLEM finished "under wraps." It could start back again, at once.

When casting your ballot, put a cross in the circle under the EMBLEM.

We Can Deliver a Majestic Side-Car to You Immediately

And it will give you the same service as it does to these satisfied users

PROVIDENCE, R. I.

MAJESTIC MFG. CO.,
Worcester, Mass.

GENTLEMEN:—Your letter of recent date is at hand and contents noted. The Side-cars are becoming very popular here and a great many will be sold. Today is Tuesday and my men are now fitting a Majestic to an Indian motorcycle, and that's the second Majestic I have sold this week. I have no more in stock now, so please hurry deliveries on orders I have on file and at the same time ship me another Red Car for Indian machine. The Side-car I used for demonstration proved very handy to me during the time I have been moving to my new location.

One instance I will mention when I carried six men from old store to new building, two sitting in Side-car, one on saddle, one on rear carrier, one standing on each footboard of the T. T. Indian I use for Side-car regularly.

I took a Side-car over the roads to Columbus, Ohio, to attend the F. A. M. meeting, and had a very pleasant and successful trip.

Yours very truly,
B. A. SWENSON.

RICHMOND, Ind., June 27, 1912.

MAJESTIC MFG. CO.,
Worcester, Mass.

DEAR SIR:—Some time ago Waking & Company, the motorcycle agents here, received a letter from you asking for information regarding your Side-car. He turned the letter over to me, I being the purchaser.

I am enclosing small photo of myself and lady friend taken in one of our city parks. You may keep this photo or tack it on a fence, or you can use it in your advertising.

I ride an Indian machine. We make from one hundred to 180 miles in a single day's run, using very little more gas than when alone. Our combined weight is 323 lbs., but we go everywhere we want to go over all kinds of roads, and they all say that the SIDE-CAR rides easier and smoother than any automobile.

If I ever wear this out, I hope you will be in the business, so I can get another.

If you care to, you can fix it up to suit yourself and use it for advertising. It will be all right with me.

Yours truly,
CHAS. A. TANGEMAN.

The Baxter Side Car is Built for ALL Roads

To be really efficient a side car must be prepared to withstand the terrific strain of negotiating rough, rocky, rutty roads as well as bowling along well-paved boulevards. For this work THE BAXTER SIDE CAR is most eminently fitted.

Its reinforced frame construction, its tension spring wheel, its solid Bessemer steel hub spindles, its body of Indian rattan, its heavily upholstered cushions—all tend to make it the strongest, the lightest, the most durable and, at the same time, the most comfortable side car on the market today. Prices, \$60.00 and up.

Dealers, write for our 1913 proposition and terms

The R-S spoils its rider for any other machine

So manifold are the conveniences which the R-S affords its rider in addition to its renowned motor efficiency that such a rider instinctively looks for such conveniences on other machines, but in vain.

Footrests, double brakes, double oiling system, the R-S shock absorbing spring seat post, adjustable to weight of rider; these are but a few of the "trimmings" which carry out to the smallest detail the policy of Service plus Comfort. Then, too, its powerful, silent, long-stroke motor with imported ball-bearings, mechanical intake valves and integral cams and gears serves to give the R-S buyer *more value, more service, more satisfaction.*

Dealers—Applications will now be considered for 1913 territory. Delay may mean a loss to you. So write us *at once.*

The *Neverout* Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS
THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

THE CORBIN LINE OF BRAKES AND HUBS

Corbin Band Brake

FOR MOTORCYCLES

Nearly 50 per cent. of all motorcycles made in America today are equipped with this brake. The 1913 model has two important improvements; a nut-lock is formed by two projections on the end of the arm connecting band, securely holding the nut from turning or jarring loose; a bracket attached to the lower side of brake arm keeps the band from dragging on the drum or sagging when expanded.

Corbin Two-Speed Coaster Brake

FOR BICYCLES

Invaluable for riding in hilly country or against strong winds. No levers or wires are required to change gear. All parts contained within the hub. Action is automatic. Operated by the pedals. Very simple, strong and reliable. Wide choice of gear combinations available. This brake is a great assistance to elderly riders.

Corbin Duplex Coaster Brake

FOR BICYCLES

Combines free wheel feature with foot-brake action. Operation can be graduated according to the amount of foot pressure applied. Instantaneous action and release. Small and handsomely shaped. Strong, efficient and durable. The best designed and most satisfactory coaster brake without two-speed feature.

Corbin Front Hub

FOR MOTORCYCLES

One of the most practical and efficient hubs made. Ensures free and smooth running. Best steel ball bearings. Knockout axle combined with this hub. Heavy, strong and reliable.

Corbin Front Hub

FOR BICYCLES

Very efficient, ball-bearing hub. Strongly and simply made. 32 and 36 spoke holes in stout cones. The standard bicycle front hub of the world.

Corbin Bicycle Brakes and Hubs can be fitted to your wheel by any bicycle repair shop.

\$125,000 To Advertise The 1913

1913 { 7-8 H. P. Yale Twin, \$275 } f. o. b. Toledo
5-6 H. P. Yale Single, \$225 }

Battery and Bosch Magneto; V-Belt or Chain Drive; Long-Stroke Motor ($3\frac{1}{4} \times 3\frac{43}{64}$ "); speed of twin, 50-60 miles per hour; Horizontal Cooling Flanges; Strong Drop Frame; Famous Y-A Shock Absorber; Vibrationless Cushion Fork; Perfect Grip Control; First Hinged Mud Guards; 3-in. Tires; Reliable Transmission; Improved Free Engine Clutch; Heitger Carbureter; 10-12 Gauge Spokes; $2\frac{1}{2}$ -gal. Gasoline Tank; 1-gal. Oil Tank (separate); Weight, 185 pounds; Wheelbase, $57\frac{1}{2}$ in.

We intend to make 1913 the biggest and best year the Yale or any other motorcycle has ever known—to emphasize, extend and expand the Yale reputation all over America.

No motorcycle has ever had such advertising back of it as we will put behind the Yale—and the combination of extraordinary Yale features (many of them exclusive) and extraordinary Yale advertising is bound to make the 1913 Yale the biggest “winner” in the industry.

What We Will Do

We will spend \$125,000 to advertise the Yale in the best national publications and newspapers.

We will use pages and double-pages in The Saturday Evening Post until there won't be one of its 10,000,000 readers that doesn't know the Yale story.

We will start this campaign on October 19 with a two-page announcement in The Post; and we will keep it up throughout the season.

We will give Yale dealers the most superb sales co-operation any motorcycle dealer has ever had.

We will give you live prospects who will be convinced that the machine they want bears the Yale nameplate.

What You Should Do

If you are a Yale dealer you should prepare yourself for the best year you've ever had.

You should begin all over again; study the Yale features; compare it with other motorcycles; and be ready to point out its superiorities in every essential detail.

If you are not a Yale dealer—well, see the two-page announcement in The Saturday Evening Post of October 19.

Read it carefully—and just imagine what the effect of such telling Yale arguments will be.

There is great big money ahead for Yale dealers—you should get some of it.

Write the Sales Manager for particulars. Don't delay.

THE CONSOLIDATED MFG. COMPANY, 1730 Fernwood Avenue, Toledo, O.

F. C. CORNISH, Eastern Representative, 219 Clinton Ave., Newark, New Jersey.

Yale Quality Yoked With Big Advertising

1913 { 7-8 H. P. Yale Twin, \$275 } f. o. b. Toledo
 { 5-6 H. P. Yale Single, \$225 }

Battery and Bosch Magneto; V-Belt or Chain Drive; Long-Stroke Motor ($3\frac{1}{4} \times 3\frac{43}{64}$ "); speed of single, 40-50 miles per hour; Horizontal Cooling Flanges; Strong Drop Frame; Famous Y-A Shock Absorber; Vibrationless Cushion Fork; Perfect Grip Control; First Hinged Mud Guards; 3-in. Tires; Reliable Transmission; Improved Free Engine Clutch; Heitger Carbureter; 10-12 Gauge Spokes; $2\frac{1}{4}$ -gal. Gasoline Tank; 1-gal. Oil Tank (separate); Weight, 185 pounds; Wheelbase, $57\frac{1}{4}$ in.

Yale advertising is going to be so big, so sensational—and so continuous—that it is bound to win—and back of it will be the conscientious construction principles that have made the Yale name synonymous with reliability.

We will see to it that the gospel of Yale goodness and Yale consistency is spread broadcast over the land—but it's up to you to say whether or not you'll help us reap the harvest, by taking over the Yale agency (or just keeping it) and pushing as hard as you know how.

Yale Features

Yale features (most of them exclusive, by the way) are so many and varied we can merely indicate them here.

The powerful motor has never yet tackled any obstacle could not overcome; the horizontal cooling flanges were first introduced on the Yale Twin and proven to be the only correct ones in principle and practice.

The shock absorber is so great that it can't be "killed" by the famous Y-A Shock Absorber; while the perfected Yale grip control works infallibly.

Yale offers the first hinged mud-guard on any motorcycle. This will prove invaluable in the mending of tires.

Yale offers not only large $2\frac{1}{2}$ -gal. gasoline tank and 1 gal. oil tank (separate), but it also gives, for the first time, 3-inch tires as regular motorcycle equipment.

Yale Construction

Besides the Yale equipment features the Yale dealer also has the tremendously important feature of Yale construction.

The Yale has more parts made in its own factory than any other motorcycle made.

It has its own drop forging plant; and where other motorcycles use metal stampings the Yale has Yale drop forgings—drop forgings that make for sturdiness and insure safety.

Not a single Yale fork or frame broke in 1912. What other machine can claim such a record?

Such facts as these will be told to the motorcycle-buying public—again and again.

—They will go to the Yale store to seek—and buy.

Why not make that Yale store yours?

Dealers everywhere—write the Sales Manager concerning open territory. But write at once.

THE CONSOLIDATED MFG. COMPANY, 1730 Fernwood Avenue, Toledo, Ohio

Manufacturers also of Yale and Snell Bicycles, Hussey Handle Bars, Drop Forgings.

The Motorcycle Manual

Is the *last word* on the subject of a publication giving comprehensively and in a handy form *all* the information required by a motorcycle rider or dealer. 124 pages, printed on coated paper.

Motorcycle engine and frame parts illustrated and fully described—their functions fully explained, with a remedy for every possible trouble.

YOU NEED THIS BOOK

For it also tells you how to tour; gives the motorcycle laws of every state; official racing records, hill climbing, horsepower and other formulae, and a complete directory of the motorcycle trade. Pages are magazine size, 7x9 inches.

Paper covers, 25 cents, postpaid. Cloth bound, 50 cents, postpaid. Special prices on lots of 10 or more.

For \$1.25, we will send you a copy of the Motorcycle Manual and also enter your subscription to Motorcycle Illustrated for one year.

MOTORCYCLE ILLUSTRATED, 51 Chambers Street, New York

HARLEY-DAVIDSON

The "5-35." A New A Really Successful Five H

The Harley-Davidson "5-35." Five Actual Horse Power—35 cubic Inches Piston Displacement.

TEN years ago when the Harley-Davidson Motor Company brought out their $3\frac{1}{4}$ horse power motor, other manufacturers and riders of the then popular $1\frac{1}{4}$ and $1\frac{3}{4}$ horse power type, called it a monstrosity. The monstrosity however proved to be so universally satisfactory that other manufacturers in turn were forced to manufacture motors of like size. A few years later, we brought out a still larger motor, namely our 4 horse power. This again, a second time, set a new standard for motor size.

Two years ago, this company became convinced that a still larger motor, if properly designed would render even more satisfactory service than the 4 horse power type and our designers commenced work on a new model with this idea in view. Finally a satisfactory type was evolved and built. Detail after detail was worked out until about a year ago, when our engineers became convinced that they had developed a really successful 5 horse motor.

During the past eight months this new motor, tested side by side with our 4 horse power models so firmly convinced us of its superiority that we are willing to stake our future on it, and are discontinuing the manufacture of our popular 4 horse machine.

When you consider that the Harley-Davidson Motor Company is the largest manufacturer of single cylinder motorcycles in the world, (last year building more than any other two manufacturers combined), together with the fact that the 1913 output of "5-35"

singles alone will aggregate close to two million dollars, you will appreciate the confidence we must have in the new "5-35" to devote all the energies of our greatly enlarged single cylinder department to its manufacture and to absolutely discontinue the building of the conventional 4 horse power type.

After thousands of miles of hard road work over Wisconsin's hilliest and sandiest roads—after tests of every available character—these machines had made such remarkable and consistent performances that two were entered in the Wisconsin three-day tour held August 31st, September 1st and 2nd.

This was the first appearance of the "5-35" and circumstances could not have been more ideal for another thorough test. Due to extremely wet weather this tour turned out to be one of the hardest endurance tests ever held, but both of the "5-35's" finished with perfect scores, although the test was so severe that 32 singles and 57 twins, a total of 89 out of 106 entries, failed to complete the course on schedule time.

Coming as it does from the largest manufacturer of single cylinder motorcycles in the world, the new Harley-Davidson "5-35" marks the passing of the 4 horse power type and the establishing of a new standard size for single cylinders of the future, just as the $3\frac{1}{4}$ and 4 horse power Harley-Davidsons each set the motor size standard of their time and in turn marked the passing of the undersized motors of their day.

Harley-Davidson Model 5-35 Power Motor and Why

MECHANICAL DESCRIPTION OF THE "5-35."

LONG STROKE MOTOR. Years of experience by America's and Europe's foremost automobile engineers have proven absolutely and unquestionably that the long stroke motor, as adopted for our "5-35," offers six advantages over any other type of internal combustion engine.

1st: Motor develops its rated power at a much lower crank shaft speed. (The benefits of this are at once perceived by the rider in hill climbing or in negotiating heavy roads where sand or mud is encountered).

2nd: Vibration is materially reduced insuring a more silent and longer lived motor.

3rd: It is far more economical than the short stroke motor, inasmuch as its power is developed at a lower crank shaft speed and the gearing can be higher than that of a short stroke motor.

4th: Pick Up More Rapidly. Long stroke motors are more flexible than short stroke motors and handle nicer at medium and lower speed.

5th: Will Run Slower. The long stroke motor will run slower than any other type.

6th: Easier Starting because there is more leverage on the crank shaft with which to turn motor over, and because the carburetion is better.

Exhaustive experiments in the building of the "5-35" proved to us conclusively that the common or much cheaper method of making a five, namely, increasing the cylinder capacity was undesirable. The vital parts of a larger motor should be altered to properly correspond with the increase in size, but the Harley-Davidson "5-35" is the first motor in which the designers have so changed these parts and enlarged the inlet and exhaust chambers and passages to properly accommodate the increased piston displacement.

INDEPENDENTLY OPERATED MECHANICAL VALVES. In the "5-35," we use separate cam shafts for both inlet and exhaust valves. This enables a much more accurate timing of the motor.

The inlet valve operating mechanism is in turn actuated by one of the gears in the magneto drive train. The exhaust valve mechanism remains unchanged from that which has proven so successful on the Harley-Davidson in the past. The steel formerly used for cams, and gears, has been replaced by nickel steel, thus even further increasing the life of the Harley-Davidson motor.

HEAVIER FLY WHEELS. The "5-35," being a more powerful motor, the fly wheels are necessarily made heavier than those in the former 4 H.P. type. The fly wheels, piston, and connecting rod are each machined to balance, and then assembled and again balanced as an integral unit.

CRANK SHAFT. The crank pin is now made interchangeable, both ends being taper ground and locked into the fly wheels by means of a special nut, absolutely preventing its coming out of alignment.

LIGHTER PISTONS. The piston in the "5-35" is the same size as that formerly used in the 4 H. P., but is of light construction, experiments having proven that this aids materially in the rapid acceleration of the machine from slow to high speed. This also facilitates the balancing of the rest of the moving parts.

OIL POCKET IN THE EXHAUST CHAMBER. In the exhaust chamber of the "5-35," we have constructed a small oil pocket which catches the oil on the exhaust valve stem, thus preventing it from running down the stem and over the crank case. The heat of the exhaust vaporizes any small excess of oil, when it occurs and thus passes it away in the exhaust unnoticed. This refinement is far more important than it at first appears to the uninitiated.

NEW CRANK CASE PRESSURE RELIEF. A larger crank case vent has been provided. This not only helps to keep the motor cleaner, but is a decided aid in the lubrication of the motor at high speed.

LUBRICATING SYSTEM. The lubricating system in the "5-35," is the same semi-automatic vacuum feed that has been used on the Harley-Davidson in the past ten years and upon which we have still found no room for improvement, except in minor details.

TRANSMISSION. This model can be had in either the Harley-Davidson protected belt drive or in double roller chain drive, the latter driving through a double eccentric counter-shaft and the famous Free-Wheel Control in the rear wheel. This system of chain transmission with large sprockets and Free-Wheel Control is the same as has proven so successful on our chain driven twins in the last year. A very efficient chain guard is also supplied.

BELT PROTECTOR. In front of the engine drive pulley on the belt model we have placed a curved protector which absolutely prevents mud, water and sand being thrown up onto the belt and pulley by the front wheel. This makes a marked difference in the life of the belt and we consider it a very valuable refinement.

The New "5-35" Motor.

Comparative Power Chart Proves Wonderful Flexibility and Vigor

The Harley-Davidson "5-35" Belt Drive.

GREATER pulling power at low speeds---more power on the hills---more power for mud, sand and rough roads---that has been the cry for years and that is the demand our engineers set out to satisfy when they first commenced work on the "5-35" some two years ago.

That they have accomplished what they set out to do is plainly shown by the comparative dynamometer chart reproduced on the opposite page. Nearly three times the pulling power of the famous 4 H. P. Harley-Davidson at 5 miles an hour---more than twice the power at ten miles an hour---83% more at 20---and so on. The record chart tells the story better than we can. It stands as mute evidence of the untiring work during the past two years of Wm. S. Harley and his assistants---the best engineers in the motorcycle industry.

MORE PULLING POWER. Experience with the very first 5 H. P. motors we built convinced our engineers that the automatic type of inlet valve would not do the work on the larger motors. So Mr. Harley set about to work out a mechanical valve system. The result is the simplest and at the same time the most efficient devised up to this time. By utilizing one of the gears in the magneto drive train not only were a large number of extra parts done away with but it made possible independent and consequently closer adjustment of the timing of the intake---a mighty important point on any single and doubly so for one as large as the "5-35."

VIOLENT ACCELERATION. 40 miles an hour in 16 seconds from a standing start. No other single will do this. The average twin will do but little, if any better. It took our experimental department nearly two years to develop this "quick pick-up."

"Kill all vibration" was Mr. Harley's order when he started to increase the acceleration of the "5-35." He realized that with a smooth running motor, half the work would be accomplished toward the building of a powerful, flexible, single cylinder motor. Nearly a year altogether was spent in balancing the fly wheels and reciprocating parts of the "5-35," but it was time well spent. The machine certainly did "dig" when the throttle was opened.

Then larger exhaust and intake chambers and passages were incorporated and these made a world of difference too. The entire combination worked out, almost cut in two the time of acceleration from five to thirty miles an hour.

THE "5-35" IS SPEEDY TOO. We have yet to see the 4 H. P. machine that will keep up to the new "5-35" on any kind of

es Marked Increase in Power Acceleration of the New "5-35"

Form 1852 1M

DYNAMOMETER TEST CHART

HARLEY-DAVIDSON MOTOR CO.
MILWAUKEE, WIS.

Date *8-1-21*
Operator *J. W. Harper*

Card Record *1260*
Motor No. *1260*
Motor No. *1260*

The "5-35" motor actually develops 35% more power than the 4 H. P. at 40 miles per hour.

The "5-35" develops 48% more power at 30 miles per hour.

The "5-35" develops 80% more power at 20 miles per hour.

The "5-35" develops 103% more power at 15 miles per hour.

The "5-35" develops 145% more power at 10 miles per hour.

The "5-35" develops 166% more power at 5 miles per hour.

Red Line Shows Power Curve of "5-35" Motor, Black Line Shows Power Curve of the Former 4 H. P. Harley-Davidson.

road, good or bad, and when we say this it is with the full knowledge that although the 4 H. P. Harley-Davidson was not made as a racing machine it has been universally recognized as the fastest and most powerful single cylinder motorcycle on the market heretofore, and that it has repeatedly defeated twin cylinder machines of other makes of from five to seven H. P. in such important contests as the Denver-Greeley Road Race and the Milwaukee Board of Public Works police tests as well as many others.

WHAT THE ADDED POWER OF THE "5-35" WILL DO. Hills that will stall any ordinary single are nothing for the "5-35." Heavy sand and mud can be negotiated without resorting to the Free Wheel Control and without racing the motor. Think what this means, not only to the permanent life of the motor but to the comfort and convenience of the rider as well. The "5-35" motor can be slowed down to a decent riding pace without the danger of "stalling" so inevitable to the ordinary single. On the other hand, how many owners of single cylinder machines have become dissatisfied with them for no other reason than that they were sluggish? They would not pick up quickly. With the "5-35" the annoying hesitation so marked on most singles has been done away with. Careful study of the comparative chart of the "5-35" and the previous 4 H. P. Harley-Davidson is a revelation even to anyone intimately connected with the technical points of a gasoline motor.

"It handles like a twin." That is the way J. W. Harper, Harley-Davidson dealer in Miami, Florida, spoke of the new "5-35." A pretty strong statement we admit—possibly too strong. But we will put it up to the "5-35" itself to make good.

The now famous patented Ful-Floteing Seat is of course incorporated in all the latest models of the Harley-Davidson. This device, brought out by us a year ago has proven itself to be all and even more than we ever claimed it to be. Placing as it does 14" of springs between the rider and the bumps, it successfully eliminates all the jolts and jars of road vibration, so objectionable in the ordinary motorcycle.

The Ful-Floteing Seat is simplicity itself. The springs are enclosed in the frame tube and there are no projecting parts to catch on the riders' clothing. There are no small delicate parts in the Ful-Floteing Seat to break or wear out and the construction is of such a nature that side play or lost motion of any kind is a mechanical impossibility, and consequently there is no chance for the device to develop chatter or rattle.

The patented Free Wheel Control, another exclusive Harley-Davidson feature is located in the rear wheel—the only place where there is room to make the parts large enough to do the work required. Like the Ful-Floteing Seat, the Free Wheel Control has made good on more than ten thousand Harley-Davidsons and the results obtained justify every claim we ever made for it.

The Free Wheel Control has 76 square inches of contact surface and enough range of adjustment has been provided to take care of possible wear for years. With the Free-Wheel Control the Harley-Davidson may be started without the hard pedaling or the necessity for running alongside to start the motor. The mere shifting of a convenient hand lever is all that is required to operate the Free-Wheel Control.

The Latest 7-8 Horse The Most Uniformly S

The 7-8 Horse Power Harley-Davidson Twin. 60.34 Cubic Inches Piston Displacement.

THE 7 to 8 H. P. chain drive Harley-Davidson twins which we have built up to this time have been so far ahead of their time and have given such universal satisfaction that any improvements would seem almost unnecessary. Nevertheless we have not only materially increased their speed, but by a number of important refinements have made these machines even more flexible and more powerful at all speeds.

Our experience with the "5-35" having demonstrated absolutely that larger inlet and exhaust chambers and passages permitted a better charging and scavenging of the cylinder, thus making the motor more flexible, more powerful at all speeds, and considerably faster, our designers have incorporated these features in the new Twin.

The connecting rods of the front and rear cylinder are balanced not only with respect to each other, but also in relation to the pistons and fly wheels as a complete unit. Lighter pistons also aid in a quick pick up and make the machine faster. The fly wheels themselves are carefully balanced now so that it is possible to throttle this machine to an even slower pace than heretofore.

A new design of hot air intake on the carburetor has completely silenced the breathing noise which was sometimes heard when the machine was running slow and pulling hard as on hills or in heavy roads.

An auxiliary air adjustment on the intake manifold is furnished as standard equipment.

COMPRESSION RELIEF. The Exhaust Valve Release used for starting the twin cylinder Harley-Davidson proved so suc-

cessful during the past year that we cannot help but mention here the sturdy construction of this vital part. Nothing could be more annoying to a rider on a pleasure tour or at any other time for that matter, than to have the compression release go out of commission. On the Harley-Davidson the actuating part of this device is a one piece drop forging and it should outlast even the motor.

Many more refinements, which have suggested themselves as a result of a year's use of over two thousand of these machines on the road have been incorporated in the latest twin, making this motor even more quiet than before.

CRANK PIN BEARINGS. Before the appearance of the Harley-Davidson Chain Drive Twin, the connecting rod bearing in all twin motorcycles had given more or less trouble. This was undoubtedly so because of the fact that this bearing receives more service than any other part of the machine. By far the majority of twin cylinders have been equipped with bronze bearings at this point.

They were far from satisfactory however. The wear was heavy, and there being no method of adjustment it was generally necessary, in a comparatively short time, to replace these bearings. While this was often done by the dealer, and in some few cases by the owner himself, it was almost impossible for either to make a workman-like and mechanical job, the more desirable method being to forward the engine to the factory, where new bearings could be forced in with the special presses, machinery and tools necessary for this work. This feature, which was true of all twin cylinder machines was one that the Harley-Davidson Company set out to remedy.

Power Harley-Davidson factory Twin Ever Built

A series of exhaustive experiments were conducted with various types of ball bearings. While these offered the advantage of reduced friction the point thus gained was more than offset by the fact that in case of breakage, or even the chipping of one of the balls (and this occurred with prohibitive regularity) it caused the ball races to soon be chewed up and permit sufficient play in the connecting rod to permanently damage the motor. If this play was not attended to immediately there was a great likelihood of breakage of the fly wheels, crank case or even a good chance of the piston going beyond the bore of the cylinder and breaking itself or the cylinder. Obviously this type of bearing was mechanically undesirable.

After another series of extensive experiments and rigid road tests, with various types of roller bearings, our engineers evolved an entirely new type of double roller bearing, that is, two independent sets of rollers, one for each connecting rod, but both working on the same crank pin of course. This type of bearing was found to so greatly reduce the friction as to increase the speed of the machine several miles per hour. In this bearing the contact was a rolling contact instead of a sliding one, as in the case of the bronze bearings, therefore necessitating less oil to keep it properly lubricated. In comparison with ball bearings the argument was all on one side. This roller bearing in other words was a continuous bearing carrying the thrusts of the rods for the whole width of the bearing instead of confining this thrust or strain to a single point or possibly two points as was the case with the ball bearing types.

By careful hardening of the rollers and races, we found we were able to reduce wear to a minimum, giving this bearing an estimated life of nine and one-half times that of the ordinary bronze bearing. (The fact that we have used both types of bearings enabled us to make a very careful comparison.) This also permitted the added advantage of a bearing that was absolutely interchangeable. Not only this, but experience showed that what little wear did develop in these bearings after the most strenuous test, was in the rollers themselves, which rollers could be easily replaced by any rider for a few cents. These replacements of course put the bearing in perfect condition again.

Of course this double type of roller bearing, as in the case of many other refinements, has added materially to the cost of production, but the aim of this factory has never been to build a machine down to a fixed price, but rather up to the highest standard attainable.

CHAIN SIDE BEARING. All twins will hereafter be equipped with a self-aligning ball bearing (made to our order in Europe) on the drive side of the crank shaft. This was advisable, yes, even necessary, because of the peculiar strains and stresses placed upon the driving crank shaft of a twin cylinder "V" type motorcycle motor. At this point the bearing not only has to withstand the powerful thrusts of the motor impulses, but widely varying shocks and strains from the transmission due to constantly varying road and load conditions as well.

These double torsional strains of course spring the shaft temporarily out of perfect alignment which would make the bearing bind momentarily if a rigid type of bearing were used such as bronze or the ordinary type of roller or annular bearing. These strains are bound to finally cause crystallization and consequent disintegration

of the balls or rollers and races of the ordinary fixed type of bearing. Not only this, but the twisting strains being transmitted of course to the crank case and fly wheels sooner or later are liable to crystallize these parts making fracture almost a mechanical certainty. Taken altogether the self-aligning annular ball bearing used in the Harley-Davidson Twin is the only bearing that will stand up indefinitely on a twin cylinder motorcycle motor.

This type of bearing is the most expensive to be had and its installation, like that of many other refinements is only in keeping with the policy of this company, namely, the building of a machine which shall always represent the highest standard possible.

Refinements on All Models.

Larger inlet and exhaust chambers and passages facilitating better charging and scavenging of the cylinder, making for more speed and greater power and flexibility at all speeds.

Oil pocket in the exhaust chamber which catches any excess oil, preventing it from running down the exhaust valve stem and over the crank case. The heat of the exhaust vaporizes this oil as it collects, allowing it to pass away in the exhaust unnoticed.

Lighter pistons and balanced connecting rods, and fly wheels.

More clearance between mud guard and tires, allowing the use of chains on even a 3" tire if desired.

28x2 3/4" tires are regular equipment on all models.

Wider forks to correspond with increased clearance all around.

Heavier reinforcements in the front forksides.

Rocker plates on the front forks now made of nickel steel and fitted with removable hardened steel bushings to take up wear after several years of hard service. These bushings are replaceable for a few cents when worn.

A new stand catch will be appreciated by those riders who have been obliged to put up with soiled hands or gloves or spoiled shoes.

The stand itself has been materially strengthened by drop forged re-inforcements.

The operating lever for the Free Wheel Control has been put in a more convenient position.

Always aiming to make the Harley-Davidson better, we are now using a special grade of grip control wire made in Europe, to our own specifications. This wire costing considerably more than that used last year, has a tensile strength of just three and one-half times that formerly used.

On all chain drive models a double eccentric crank hanger or countershaft is used, this exclusive feature providing separate and independent adjustments for both front and rear driving chain and pedaling chain as well.

Armored Bosch magnetos are furnished on all models.

Timing gears and cams are made of nickel steel with cam and gear made in one piece.

Longer recoil springs make a more perfectly balanced action in the fork.

A concealed Yale type of lock will be a feature of the metal tool boxes this year. This is not only more convenient and safer than a padlock, but there is no separate padlock to be lost.

Harley-Davidson Policy and Prices

Years ago this firm was forced to make the decision which all progressive firms must make, sooner or later, namely, whether it was advisable to manufacture a low priced product of a corresponding quality, or a strictly high class product with the higher price which such a standard would unquestionably necessitate.

Beyond all doubt, the making of a cheap low priced product offered by far the easier road to rapid sales and a wider profit. But the mechanical ability of the practical men who form this company made them resent the idea of the manufacture of a cheap product—made them resent it, because they knew that at all times their ability would be held down by that “building to a low price” which this decision would most obviously necessitate. The cheapening of materials, hiring of inferior labor, etc., necessary when building a cheap machine, was also repulsive to them.

If they chose the other path, namely the building of a product to the highest standard attainable, they knew that the price they would be forced to ask would hinder sales until the real worth of their product had been proven by actual use over and over again all over this country. They believed however that the American Public would gladly, yes, willingly, pay for quality, if the quality claimed was really there.

The question was threshed out pro and con over and over again. Finally a decision was reached and this firm adopted a policy from which it has never deviated in the slightest degree, namely the resolve to build the best machine that money and ability could turn out. It was really not until 1911 that this firm really profited by this resolve for up until then the demand for motorcycles was so large and the supply so small that almost any kind of machine could be disposed of.

Unquestionably, every motorcycle dealer will remember the time when all motorcycles sold at a standard or fixed price, but in 1911 the supply caught up with the demand and for the first time it was not a question on the part of the purchaser of taking what he could get deliveries on, but a question of what machine offered the most value for the money.

Apparently the public had begun to realize and appreciate the real value of the Harley-Davidson, for while this firm was away oversold and unable to fill all their orders several firms finished the year with a stock of machines on hand which they were compelled to carry over into 1912 as you will recall. The day of inflated prices and over-demand had passed. With abundant supply, the purchaser was able to select the machine he preferred.

In 1912 we again brought out new models. As you will remember these new models incorporated the Ful-Floteing Seat and Free Wheel Control, and were, without question, the greatest values ever offered to the public for the money. When we made our announcement to the trade, many other manufacturers seeing at once the impossibility of competing with the product we offered at the same price, announced cuts in prices, some firms making two distinct announcements, one before and one after the Harley-Davidson announcement.

In spite of the fact that our price was by far higher in 1912 than that of many other manufacturers we sold our entire output and could have disposed of more machines had we had them. While the price was higher, the value was there and the public appreciated it.

Understand, we are not in any way reflecting on the host of manufacturers who are today building a cheap machine. We do not believe a single one is making more than a legitimate profit. Some less, and we honestly believe every purchaser of these machines received all that the low purchase price really entitled him to.

Unfortunately, however, some of these buyers were led to believe that the lower price entitled them to Harley-Davidson quality. They forgot that higher quality always necessitates a higher price.

In spite of the many improvements and refinements we are incorporating in our new models this year, our greatly increased capacity (100%) will enable us to market our improved machines without any advance in price, and we honestly believe that this new model will render even firmer the leadership the Harley-Davidson has attained in the motorcycle industry, and which has caused the public to name it “The Packard of Motorcycles.”

Model 9-A	“5-35” Motor, 5 actual horse power, 35 cubic inches piston displacement, protected belt transmission, driving through Free Wheel Control. Price	\$235
Model 9-B	“5-35” Motor, 5 actual horse power, 35 cubic inches piston displacement, roller chain transmission, driving through Free Wheel Control. Price	\$235
Model 9-E	7 to 8 Horse power twin cylinder, 60.34 cubic inches piston displacement, roller chain transmission only, driving through Free Wheel Control. Price	\$285

Magneto Ignition, Ful-Floteing Seat and Free-Wheel Control Are Standard on All Models.

Perfect Score With Continental-Erie Tires

CAMBRIDGE, Mass., October 9, 1912.
Continental Rubber Works, Erie, Pa.

GENTLEMEN: I beg to advise you that I entered the Nine Hour run held by the Providence Motorcycle Club with my machine equipped with Side Car. Both the machine and Side Car were equipped with Continental-Erie Motorcycle Tires, and I finished with a perfect score. I am pleased to advise you that these Tires show but very little sign of wear, and I consider this remarkable, in view of the fact that I have been using these same Tires for the past two months throughout New England, testing out our Side Car, and Tires are standing up remarkably well under the hard usage.

You have an excellent tread stock on these and I am very well pleased with the Tires of your make that we have used thus far.

Yours very truly,
BAXTER SIDE CAR CO.,
(Signed) James Baxter.

Motorcycle Supplies

OLIVERKELLY M. O. OLOOK
movement is standard and guaranteed. Case is solid brass casting, nickel plated. List, Each \$3.50.

MOTORCYCLE STAND LIFT
avoids necessity of dismounting after machine is started on stand. Simply give machine forward push and lift raises stand to proper position in guard clip.
List, Each \$4.50.

SPARK PLUG UMBRELLA
should be used on all exposed engines where water is likely to come in contact with plug and cause short circuit.
List, Each .50.

"G" PATCH ASSORTMENT
contains 10 Ready-to-Use Patches, which require no cement. Patches are 1 1/2 inch—just right for punctures. Contained in air tight brass box moisture and rust proof.
List, Each .60.

O. E. JUNIOR TIRE TALC.
Handsome lithographed silver top metal can, with friction bottom, which can be opened when empty for refilling. Measures 1 1/2 by 5 inches. Best quality talc. Highest grade package for purpose ever put out.
List, Each 10.

EAST INDIAN MICA PLUG,
made of best East India mica. Lateral winding instead of mica washers. Best motorcycle plug made.
List, Each 75

5 INCH MOTORCYCLE FLIER.
High Grade. Finely nickel plated.
List, Per Pair, .50.

WHOLESALE ONLY.
Order through your dealer. Positively no correspondence or orders handled in any other way. Dealers, ask for 500 page catalog of motor and cycle material. Most complete line ever shown.

EMBLEM MEANS EFFICIENCY AND ENDURANCE

After all, when all's said and done, a motorcycle which contains, in the largest measure, these two qualifications—efficiency and endurance—can cope successfully with machines which are bedecked and upholstered with various (so-called) comfort-insuring devices, but which fall woefully short in point of **plain, every-day service.** That's where

The Emblem "The Eager Motorcycle"

excels. Hasn't it struck you as significant that whenever tours of unusual length are planned—and successfully accomplished—it is always the Emblem that figures prominently?

Learn more about the **Emblem.**

applied
for

Clark Motorcycle Starter

A NEAT and compact attachment for the carbureter, that starts the engine without excessive pedaling, reduces carbureter trouble fifty per cent and cuts down the gasoline bill. A gasoline engine requires a richer mixture to start on than is needed after it is warmed up. Without the Clark Starter, it is necessary to open the needle valve more than is required to give efficient results after the engine is warmed up. [Price, 75c. each]

Clark Acetylene Tank Brackets

For attaching tank to top cross bar of motorcycle frame. These brackets are fastened to the cross bar in a very rigid manner and have a flaring base which rests lightly on the gasoline tank. This base prevents the tank from jarring loose on the roughest roads. To install brackets merely set in desired position and tighten one set screw in each bracket with a screw driver. Guaranteed to hold tank in perfectly rigid position. [Price, highly polished nickel plate, \$1.50 per pair]

Speed vs. Safety

"Faster! Faster! Faster!" comes the cry of the speed maniac on every hand, while day after day the Grim Reaper collects his toll of lives needlessly sacrificed in the frantic effort to excel. *And all for what?* Surely the fact that a high powered motorcycle can go around a steep saucer at tremendous speed does not help in any way to impress the onlooker with the desirability of motorcycle riding, its safety, its comfort and its manifold other attractions. And the speedster on the road, who ignores city and town ordinances, crashing through sleeping villages at night at a fifty-mile clip with his muffler wide open, or whizzing through populous towns with speed unabated, leaving behind him a wake thickly strewn with startled pedestrians, horses rearing in blind terror, frightened children and a general atmosphere of antipathy and consternation; such a person does more to bring the motorcycle into disrepute than can be counteracted by thousands of dollars spent in promoting favorable publicity.

Not to be overlooked among the causes of accidents due to speeding is the fact that the usual transmission employed in speed contests is of such an uncompromising character as to inevitably cause disaster, if such transmission were to go wrong in the slightest way. When a high-powered machine is coupled with a rigid, inflexible, yet inadequate chain transmission and such a machine is turned loose in crowded traffic, bestrode by an inexperienced rider, that machine becomes a menace to the public safety and does in no way aid in popularizing the two-wheeler.

The Graton & Knight Manufacturing Company wish to announce that beginning with the succeeding number of this publication they will inaugurate a series of "Belt Talks". These talks will have as their object the exposition of

the belt drive as the only sensible, practical and logical form of transmission. They will endeavor to explain fully and beyond the possibility of misunderstanding the reason for the enormous popularity of the belt as a flexible and at the same time tremendously strong and efficient mode of transmission. They will aim to instill into the minds of the American motorcycle riders, the undeniable superiority of the Spartan belt drive.

As a rule, the English are a slow race to adopt anything. Cautiousness and conservatism are their prevailing traits. Therefore, it is a very significant truth that no other form of motorcycle transmission has a "look-in" in England, other than the belt. They have proven beyond peradventure of a doubt that the belt transmits *all the power necessary*, even for sidecar riding, for which strain no belt has yet been specially prepared, but which the belt has nobly proven its power to withstand.

It is not our purpose to disparage the various other forms of transmission now in vogue in America, but merely to *PROVE* conclusively that the belt is capable of furnishing *all* the speed necessary and desirable to any one other than a *speed fanatic*, (which class is fortunately in the minority), and at the same time excels all others in consistency of performance and all-around wearing qualities.

To these "G & K Belt Talks" we solicit your careful attention.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubos, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

Do You Want to be SHOWN? Here is PROOF of the Worth of the

SCHICKEL VALVELESS TWO-STROKE MOTORCYCLE

During the past year, Mr. Reader, we have shown you just what the Schickel Motorcycle is. We have shown you the beautiful and graceful lines in the complete machine. We have taken you through our series of feature talks, and shown you its every detail, and now we are showing you what Schickel dealers and Schickel riders everywhere in the United States, from Seattle, Washington, to Canal Zone, Panama, have to say about this, "The Master Motorcycle."

The following are extracts from letters we have received:—

I must give you a few words of praise concerning your machine. I have ridden it about three hundred miles and must say that it is still picking up speed and power. I trimmed up several machines that went out with me. I beat them both on hills and on the level. Your machine certainly is a sticker when it comes to a hard pull. She will out-pull any four-cycle that I have contested with so far.

Minneapolis, Minn.

Sept. 13th, 1912.

I have received the "Schickel" No. 121 delivered to Capt. Mowbray, given same a good try out, and will say that I am thoroughly pleased with what the motor can deliver and the strong scientific lines of construction. I believe it will prove a "Master Motorcycle."

May 15th, 1912.

C. E. GILMORE,
Empire, Canal Zone.

The machine is having constant use, as a great many are in doubt about the motor and do not think it will "hold out," so I want to "show them." The machine is so simple that I have a hard time trying to convince the experienced riders that it is true.

March 15th, 1912.

LOUIS SCHOENE,
Evansville, Ind.

I didn't have a minute's trouble with the engine, and of all the unfavorable road and weather conditions you never saw the like. I had one bad fall while coasting down a hill with the engine running free and the brake almost locked. I got a bad cut below my eye from my goggles. This happened 4 miles west of Brazil, Ind., between Terre Haute and Indianapolis, and the farther I went the worse the roads got, and the motor showed up beautifully through sand and on hills.

I always found a curious crowd of dealers and riders anxious to see the machine and hear it run.

Can't say too much in praise of the fork and frame construction, as my machine has gone through an awful test and is very little worse for the experience. Had it not been for the strength of those forks I probably would have been killed by some of the ruts that I hit on strange roads and at good speed.

Evansville, Ind.

ELMER E. DEAR.

Demonstrator received. Have tried the machine and find that it runs good. I like to hear it hum.

I have invested in several other machines, but as soon as I can dispose of those on hand I will sell the Schickel exclusively, provided I can get them when ordered.

Enclosed find twenty-five (\$25) dollars deposit on machine number two, which I hope you will send as soon as possible.

June 18th, 1912.

E. P. BAUCH,
Blue Island, Ill.

Very recently I purchased one of your machines and am very much pleased with it. If it is not too much trouble would you be so kind as to send me a book of instructions and the exact proportion of oil to use.

Yesterday the machine was taken through a ford which entirely submerged the crankcase and it never missed a stroke. A speed of fifteen miles was required to get over.

Aug. 26th, 1912.

WM. A. SCOTT,
Washington, D. C.

Your Schickel machine has a pretty running motor and I am much pleased with the appearance of it.

Aug. 7th, 1912.

C. B. COTTEN,
Salt Lake City, Utah.

Now, to tell you the truth, I like the Schickel better than any motorcycle I ever rode and I have had a lot of them. It has them all beat on hills and runs so smooth and nice.

L. M. GRAY,
Greenville, S. C.

Oct. 4th, 1912.

The motor is a little stiff in its joints yet, but believe me it certainly runs nice. I have made some very steep hills with ease, but I did not use half enough cylinder oil on the start, but did not run it but about a half mile so there was no harm done to the engine.

This is the first motorcycle that I ever owned or rode and have had no trouble in the riding or driving of the machine, and think that I have made the grandest choice of machine on the market today. It is not only me that thinks that way, but nearly all the people that have seen me riding. Both old and young wonder how I ever run across a machine like that. They never heard of the name Schickel before.

JOHN E. McLEOD,
Washington, Kans.

Aug. 10th, 1912.

Mr. — rode a twin — with me up to within six miles of Great Falls, Va.-Md., and there he had to give up as his machine stalled on the hills, stalled in the sand, which was from 8 to 12 inches in depth; he stalled in the heavy cracked stone that was just put down on that road, which was very hard going, and he had trouble from the start. The Schickel behaved much better; there was not a hill that it stalled on, there was not a time when I was compelled to get off and push it thru sand or the heavy cracked stone, as the machine is the easiest machine I have ever ridden in sand or in any place where it was hard to steer, and over the whole route of about thirty miles I did not have the slightest difficulty with the machine—the spark plug was clean, nor was there any soot to be found anywhere in the cylinder.

JOHN L. HINES,
Washington, D. C.

July 13th, 1912.

We received the Demonstrator, Monday 26th, and as far as appearance is concerned, the machine is first class. We have not had the opportunity to give the machine a thorough test on account of the severe weather and bad roads; but the tests we were able to give proved more than we expected. We really are surprised at the simplicity, power and beautiful appearance of the machine. The arrival and a few demonstrations of the machine have taken the whole city by storm, and all motorcyclists and others are highly elated over the simplicity and quietness of the motor. It is the talk of the town, and we intend to keep it so, by devoting all our time and energy to the sale and advertising of the Schickel Valveless Two-Stroke Motorcycle.

ERIE MOTOR SALES CO.,
Erie, Pa.

Aug. 28th, 1912.

A lot of the fellows have got twin cylinder machines, and believe me I have shown them something with my demonstrator. I have got a number of the fellows interested in your machine, and they said, "Me for a Schickel after this."

I think it is the neatest and prettiest machine on the market today. Everybody that has seen it and heard it running say they can't get over the quiet purring of that two-cycle engine.

PAUL NEWMAN,
Cleveland Hgts., Ohio.

June 29th, 1912.

I have given the machine some good road tests and it has gone over some extremely hilly and rough roads, covering about one thousand miles. It has proven to be a good hill climber.

How soon will the factory be able to make 1913 delivery? How many machines could be delivered to me in how long a time?

G. F. GOODING,
Seattle, Wash.

Sept. 30th, 1912.

The Master Motorcycle

Now, Mr. Dealer, ask yourself the question: Is this the kind of a machine you want to handle for 1913? If it is you should act at once. Daily we receive quantities of applications for territory for the coming year, and have already closed contracts for a large number of machines.

NOW IS THE TIME

MERRITT

A few tire facts for motorcyclists

FOR years, eighty per cent. of all motorcycle riders in America depended upon Morgan & Wright and G & J tires for their riding equipment. These tires were manufactured in separate factories.

Old campaigners in the motorcycle field will bear us out in the statement that they stood at the top of the list.

With the resources of but one factory to draw upon each brand was the *best* that could be produced at that time.

Up to two years ago there was no basis for judging quality standards in tire construction except on results obtained from tires built thru single-factory methods of manufacture. The idea of combining the

strongest and most desirable individual features of two leading brands of tires and producing *one superior brand* had not been conceived.

But this is precisely what the United States Tire Company has done.

United States Motorcycle Tires combine every element of strength and every effective service-yielding feature of the two brands of tires which formerly satisfied eighty per cent. of all the riders in America.

Tire users no longer are required to accept the character of service they formerly received from single-factory tires. The exceptional strength,

the resiliency, the toughness the all-around dependability of United States Motorcycle Tires belong exclusively to tires made as these tires are made.

SPECIAL SESSION OF F. A. M. DIRECTORS

Track Franchise Policy and Other Matters Will Be Acted Upon at Indianapolis Meeting on November 3.

DURING the last few weeks F. A. M. matters of special import have developed so rapidly that the members of the Board of Directors have been literally bombarded with communications, but even voluminous correspondence has not disposed of all the business demanding immediate attention, and it is likely that an extra meeting of the directors will be held in Indianapolis on Sunday, November 3. A vote of the directorate is now being taken to ascertain the sentiment of the board relative to such a session, and there is every indication that the members will be unanimous in their approval of the plan. Some of the most important questions to be taken up concern the Competition Committee, which has been considerably hampered recently owing to the fact that its policy on certain points has not been defined with sufficient clearness to permit of prompt action by the chairman.

On more than one occasion of late telegraph wires have been kept hot and dozens of letters have been exchanged in an effort to handle without delay some question arising from an application for a restrictive board track franchise, and one of the objects of the proposed special meeting will be to minimize red tape and define the F. A. M. policy on these matters so that, barring extraor-

dinary developments, they may be disposed of at once by the chairman of the Competition Committee. The board track situation has never afforded such food for serious thought as at present, and it is with a view of making the most of its opportunities that the F. A. M. looks forward to simplifying the work of its competition chairman.

The New Orleans racing horizon has been cleared by the announcement that M. F. Bramley, of Cleveland, has been granted a restrictive franchise for a board track in that city, as well as for tracks in Cincinnati, Kansas City and Detroit. Action on these applications has been pending while F. A. M. officers investigated the confusing situation at New Orleans, and the present decision is regarded as entirely satisfactory. All the Bramley applications have now been disposed of, and the promoter will rush his plans.

With reference to the application of S. G. Arthur, for restrictive franchises in San Antonio, Tex.; Atlanta, Ga.; Birmingham, Ala., and Havana, the Federation Board of Directors will proceed with caution, an intimation that Arthur and his associates would undertake the operation of an outlaw track in Dallas, Tex., if they were not granted restrictive privileges, having created an unfavorable impression in official circles.

HARLEY-DAVIDSON SINGLE IS 1913 FEATURE

Big 35 Cubic Inch Motor, Developing 5 Horsepower, is the Solution of the "5-35" Mystery—Motor and Machine Refinements Galore—The Chain-Driven Twin Completes Line of Three Models

NO 4 h. models will be produced by the Harley-Davidson Motor Company for 1913 and to replace this type the company is preparing to market a new 5 h. machine, guaranteed to deliver the full horsepower and having a piston displacement of 35 cubic inches. The motor fitted on this model will be known as the "5-35." It will no doubt be regarded as the most interesting feature of the H-D line for the coming season as it is an entirely new model, embodying many improvements over the former Harley-Davidson four, which is saying a great deal for it, in view of the fact that the 4 h. type never failed to give an excellent account of itself.

While it is new on the market this machine is not an experiment in any sense of the word; it has been in the making, and, in fact, actually on the road for close to two years. As far as outward appearance goes the first noticeable thing about the motor is the independently-operated, overhead, mechanical inlet valve. The push-rod is fitted with a silencer spring—the same construction as used on previous Harley-Davidson twins, and which successfully did away with rocker-arm and push-rod noises.

Another noticeable feature is the chain transmission now offered as an option on the single cylinder model. This drive is by means of double roller chains through a countershaft to the Free Wheel control, located in the rear wheel. Large sprockets greatly reduce chain noise and the chance for broken chains on account of doing away with short angles in the chain that are necessary when smaller sprockets are used.

Before finally putting this "5-35" motor on the market the company made a series of laboratory tests of the new motor in comparison with the 4 h. motor which has been standard on the Harley-Davidson singles for the past four years. The comparative power chart does not do justice to the 5 h. motor at low speeds; that is, it does not show the actual amount of power and the rapid acceleration

Model 9 A; Protected Belt Transmission; "5-35" Motor.

the 5 h. motor develops on the road, in comparison with the former 4 h. type.

The flywheels in the new Harley-Davidson "5-35" are heavier than those formerly used in the singles. The flywheels and reciprocating parts are carefully machined to balance before assembling, and then the complete unit or assembly is balanced as a whole, insuring an unusually smooth-running motor at all speeds.

The piston is lighter this year. Both the inlet and exhaust chambers and passages have been materially enlarged, which has done a good deal to help in the extremely rapid acceleration of this machine. Actual tests on the road have repeatedly shown that it is possible to attain a speed of forty miles per hour in 16 seconds, from a standing start, with the "5-35." The company claims that the average twin on the market will do but little, if any, better.

The Latest Harley-Davidson Twin.

The company's experience with the larger exhaust and inlet chambers and passages used

in the 5 h. motor having demonstrated that they permit a better charging and scavenging of the cylinder, thus making the motor more flexible and more powerful at all speeds, to say nothing of being considerably faster, its designers have incorporated these features in the new twin. Also, following out the idea of a more perfectly balanced and smoothly running motor, both the front and rear connecting rods having been balanced, not only with respect to each other, but also in relation to the piston and flywheels, as a complete unit.

Lighter pistons also aid in a quick pick-up and make the machine faster. These changes, together with better balanced flywheels, make it possible to throttle the new twin to an even slower pace than heretofore. A new design of hot-air intake on the carburetor has silenced completely the breathing noise which was sometimes heard when the motor was running slow or pulling hard, as on hills or heavy roads.

Crank-Pin Bearings.

Realizing that the connecting-rod bearing in all twin cylinder motorcycles is called upon to do more work and harder work than any other one part of the machine, the company has given this bearing particular attention in the 7-8 h. twin. After trying several kinds of bronze bearings and almost any number of ball bearings the Harley-Davidson engineers worked out an entirely new type of double roller bearing; that is, two independent sets of rollers, one for each connecting rod, but both working on the same crank pin, of course. They have found this type of bearing to so greatly reduce friction at this point as to increase the speed several miles per hour. Engineers agree that the roller bearing of a given size will carry a greater load than ball bearings, for the reason that the load is carried on a line the full width of the bearing instead of on a single point, or possibly a series of points as is the case with the ball bearing.

Inasmuch as the company has used both bronze and roller bearings in the twin con-

Model 9 B; "5-35" Motor, Roller Chain Transmission.

necting rods they have been able to make a very close comparison and estimate that the life of the roller bearing is $9\frac{1}{2}$ times that of the ordinary bronze type in the twin cylinder machine. An important point in regard to the roller bearings is that what little wear does develop after most strenuous tests is in the rollers themselves and they can be easily replaced by any rider for a few cents, which replacement, of course, puts the bearing in perfect condition again.

Chain Side Bearing.

All Harley-Davidson twins will hereafter be equipped with a self-aligning ball bearing (made to their order in Europe) on the drive side of the crankshaft. This was necessary because of the peculiar strains and stresses placed upon the driving shaft of a twin-cylinder "V" type motorcycle motor. At this point the bearing not only has to withstand the powerful thrusts of the motor impulses, but widely varying shocks and strains from the transmission, due to constantly varying road and load conditions as well.

These double strains, of course, spring the shaft temporarily out of perfect alignment and would make the bearing bind momentarily if a rigid type of bearing were used, such as bronze or the ordinary type of roller or annular ball bearing. These strains are bound to finally cause crystallization and consequent disintegration of the balls or rollers and races of the ordinary fixed type of bearing. Not only this, but the twisting strains being transmitted to the crankcase and flywheels sooner or later are likely to crystallize these parts, making fractures almost a mechanical certainty.

The 1913 Refinements.

Larger inlet and exhaust chambers and passages, facilitating charging and scavenging of the cylinder, and making for more speed and greater power and flexibility at all speeds; oil pocket in the exhaust chamber which catches any excess oil, preventing it from running down the exhaust valve stem and over the crankcase; the heat of the exhaust vaporizes this oil as it collects, allowing it to

Model 9E; 7-8 h. Twin, Fitted with Roller Chain Transmission Only.

pass away in the exhaust unnoticed; lighter pistons and balanced connecting-rods and flywheels; more clearance between mudguards and tires, allowing the use of chains on even 3-inch tire if desired; 28 x $2\frac{3}{4}$ -inch tires regular equipment on all models; wider forks to correspond with increased clearance all around; heavier reinforcements in the front forksides.

Rocker-plates on the front forks are now made of nickel steel and fitted with removable hardened steel bushings to take up wear after several years of hard service; these bushings are replaceable for a few cents when worn; a new stand-catch will be appreciated by those riders who have been obliged to put up with soiled hands or gloves or spoiled shoes; the stand itself has been materially strengthened by drop forged reinforcements; the operating lever for the Free Wheel Control has been put in a more convenient position; special grade of grip control wire, made in Europe, to the company's own specifications; this wire

costs considerable more than that used last year and has a tensile strength three and one-half times that formerly used.

On all chain-drive models a double eccentric crank-hanger or countershaft is used, this exclusive feature providing separate and independent adjustments for both front and rear driving chain and pedaling chain as well; armored Bosch magneto is furnished on all models; timing gears and cams are made of nickel steel with cam and gear made in one piece; longer recoil springs make a more perfectly balanced action in the fork; a concealed Yale type of lock will be a feature of the metal tool boxes this year; this is not only more convenient and safer than a padlock, but there is no separate padlock to be lost.

The 1913 models are listed as follows: Model 9A with "5-35" motor, 5 actual horsepower and 35 cubic inches piston displacement; protected belt transmission, driving through Free Wheel control, \$235.

Model 9B, "5-35" motor, roller chain transmission and Free Wheel control, \$235.

Model 9E, 7-8 horsepower twin; 60.34 cubic inches piston displacement; roller chain transmission only, and Free Wheel control. Price, \$285. Magneto ignition, Ful-Floteing seat and Free Wheel control are standard on all the Harley-Davidson models.

MERKELITES TO THE FORE.

SAM STICKNEY and Fred J. Barr, of Davenport, Iowa, both riding Flying Merckels, were winners of the motorcycle races at the Aledo (Ill.), fair; the former lowered the state record for three miles. The Merkel also scored at the motorcycle races given by the Regina (Can.), Automobile Club. Their riders took first and second places in the two motorcycle events.

BIG SAVANNAH RACE.

IF satisfactory arrangements can be made Savannah, Ga., will be the scene of a big 200-mile road race on Thanksgiving Day. Chas. T. Earle, of Brooklyn, N. Y., has communicated with the Savannah Motorcycle Club, requesting them to arrange the affair. He promises the club that he will bring down some well known pro riders and that the record for a 200 mile road race will be smashed.

CARL BLADSTROM, of Rockford, Ill., riding a twin Indian, won the recent 25-mile motorcycle race there in 26 minutes.

New "5-35" Motor.

Twin Power Plant.

ENGLISH NOTES

BY BRITISHER

Variable Gear Controversy Waxes Warm on Eve of British Show—Waterproof Clothing; a Model Outfit—Two More Unique Cycle Cars—A New High Class Solo Machine—Detachable Wheels.

THE racing and competition season is now fizzling slowly out like a burnt-down squib, and we are in the middle of the lull before the storm, the lull being the deceptive quiet of that period in which every factory is laboring frenziedly to get something really novel or sound or sensational ready for the November show, while the storm is the burst of controversy and discussion which greets the publication of the 1913 models. The main rumbling has to do with variable gears. The three-speed hub has been borne on the top-most crest of success for the past eighteen months, and owing chiefly to the way in which it hampers the removal of the back wheel, it was thought probable that all the leading makers would come out with three-speed bottom bracket gears and combined belt-cum-chain drive for 1913.

The suburbs of Coventry have resounded to the exhaust of many an experimental machine built on these lines during the past six months. Well-known outlines fitted stealthily past, and the keen eye spotted a huge bulbous excrescence in the neighborhood of the bottom bracket. But with one or two exceptions these experimental three-speed bottom bracket gears have gone to the bad. If the test gearbox was light, it used to chew up. If it did not chew up, it was heavy. If it weighed just right, and stood up well under the tester's racket, it was found to deliver no more than 50 per cent. of the engine power at the road wheel when an indirect gear was engaged; and so on. Altogether it appears probable that the majority of the leading makers will fit proprietary three-speed hubs for 1913, instead of prematurely marketing devices of their own which are not quite perfect as yet; indeed, I have seen some very gratifying contracts already signed and sealed, and the directors of one or two gear-making concerns go about with grins as long as their driving belts.

In particular the business done by the Sturmey-Archer Gear Co. is encouraging. Its technical points are: direct drive on top gear, so avoiding a small engine pulley when a low emergency ratio is required; engine can be started by pedals or kickster with the back wheel on the ground; 50 per cent. reduction range between top and bottom. In laboratory tests the fact that the bottom gear is against the friction of two pinion trains has been found negligible. If the bottom gear be against the friction of a single pinion train only, the engine pulley has to be of small diameter; and close tests show that the losses

due to belt-slip outweigh those due to pinion friction by at least 10 per cent. Countershaft gearboxes will, however, be common on heavy passenger outfits; and a certain number of two-speed countershaft gears will figure on solo machines. The postponed problems relate solely to the production of a *light, reliable, efficient three-speed countershaft box.*

Waterproof Wear.

IT would be interesting to hear whether you have any really clever waterproof rigs for motorcycling wear on your side, as we have yet to evolve something good here. Most riders wear rubberproofed paramatta overalls, consisting of a loose-skirted reefer jacket, and tailor-cut leggings, the latter having a slit outside the calf, press button fasteners, and internal gusset, to permit the boot to be thrust through the shaped lower portion. These rigs are all right until continuous heavy rain is struck; in this they begin to leak in an hour, are sodden in two hours, and dry out very slowly. Moreover, they cannot be reproofed when they get porous, which generally occurs in three months or less. Their merits are that they are cheap (\$5 the two garments). Look neat in fine or wet weather, don't show dust, owing to their fawn finish, and are porous enough to prevent undue perspiration.

Some of us have tried patented proprietary waterproofs, made under high-sounding trade marks for round-the-round dude trippers, and sold at very fancy prices. The cloth of these garments is not really continuously proofed, but woven on a venetian blind principle, and is not stormproof at motorcycling velocities. Lots of our boys, when they get caught in tropical rain, which is seldom in an average English summer, purchase fishing waders, one-piece rubber thighboots designed for wading in trout streams; these are very sweaty contraptions, easily torn, and awkward to remove; over these they sling a black or yellow fisherman's oilskin coat, and crown the scarecrow outfit with a sou'wester helmet.

One Model Outfit.

When one of these rigs comes along, the decent hotels never have room left, and the girls quit the boulevards like partridges flushed in October. We've had a soaking summer this year, and I've invented the following rig, which brings me through six hours hurricane fit to sit down to a high-class table d'hôte. Over my boots, rubber goloshes; over my legs, shaped oilskin gaiters

of the "officer" brand, non-sticky, gray or green color, good cut; these are only marketed by one or two firms, who cater for officers, not common seamen, and they cost about three dollars. On my body I wear an ordinary fawn paramatta jacket till the storm blows, when I add an oilskin of the same type as the leggings, which is normally rolled up and stored in the gap between the tail of my carrier and the curve of my back mudguard. On my head I wear a peakless "Flixson" cloth helmet, which is really a seamless head-and-neck bag of varnished cloth, with a hole for the face. Sou'westers are no good to a speed-merchant; the wind gets under their tails, and lifts it like the planes of an airship, till it almost forces one out of the saddle. This rig is cheap and waterproof. Can any American rider suggest any improvements?

More Records Overboard.

AN annual sequel to the Isle of Man T. T. takes the form of a 150-mile race on Brooklands track—our gigantic motordrome with a lap of nearly $3\frac{1}{4}$ miles. These races provided plenty of excitement, though the uneven going inseparable from so huge an area and the unyielding nature of the concrete slabs pared down the number of finishers to the absolute minimum. In the 350cc. limited class, fifteen machines started, but only four were able to finish under four hours; the winner was an Australian, S. L. Bailey, on a $2\frac{3}{4}$ h. Douglas, with double, horizontally opposed cylinders, measuring 60 x 60mm. His time was 2 hrs. 49 min. 45 sec. Twenty-six machines toed the line in the 500cc. class, and the solitary American machine, a single-cylinder Indian best ridden by O. C. Godfrey, ran very prominently. So far the Indian wins in this country have been almost exclusively confined to their big twin cylinders, but it looks as though the Hendee factory was going to annex plenty of 500cc. scalps in the near future. Godfrey, like most of the veterans, opened gently, knowing that the hard, rough going would disable the racketty brigade in a few laps. However, the wisecracks were confounded for once. A dark horse, John L. Emerson, on the comparatively unknown longstroke Norton (70 x 100mm), jumped off at a cracking pace, encountered no trouble, and refused to be pegged back. He ran out an easy winner, covering the 150 miles in 2 hrs. 20 min. 52 sec. and was signalled to continue for the three-hours track record. However he struck tire hoods, and never got round the third clock circuit.

Hawley Wins from Godfrey.

Godfrey kept riding with a bit in hand for the first hour, but when Emerson clung on to his lead, Godfrey opened out, and the Indian got faster. Simultaneously the dauntless Oliver discovered that J. R. Haswell, one of our sporting farmers, had also got another notch or so of throttle up his sleeve. Haswell was riding an experimental Triumph racer, the first ever turned out by his makers with an overhead inlet valve. The two went at it hammer and tongs to the bitter end, but Haswell had the legs of the Indian and finished in 2-34-8, as against Godfrey's 2-35-32. However, the Indian is young yet, and without doubt the Hendee single must be taken into account for next year's 500cc. laurels. A Zenith, ridden by Weatherilt, came near beating this pair, but after 145 miles his oil tank burst, and the mess started his belt slipping grievously. Emerson en route made a track record of 1-33-25.3/4 for the 100 miles, and in two hours rode 127 miles, 645 yards. It is rumored that both the 4 h. and 7. h. Indians are shortly starting for track records of the long distance types. There is always a fine crop of these rides just before the autumn exhibitions; the oilstained racers and big cards with the figure details are a fine draw on a Show stand.

Novel Passenger Outfit.

THE same fertile brain which is responsible for the autowheel—namely, the grey cerebral tissue resident in the skull of Arthur W. Wall—is responsible for the Wall Tricarriage, a cut of which is appended. This type of passenger machine has several undeniable advantages; the double driving wheels give a splendid propulsive grip on greasy surfaces; the single steering wheel affords an enormous lock, the vehicle can be turned in its own length, and handiness is only limited by the risk of an overturn; and sideslip absolutely does not exist. Its drawbacks are that an upset is a simple matter in the hands of a careless Jehu, and that it is difficult to concentrate sufficient weight on the front wheel to prevent its lifting and jogging uncomfortably over every tiny depression along the road. The spring slipsteel arm carrying the steering wheel shows that the designer has not seen his way to positively eliminate this feature. A heavy 5 h. single cylinder engine, is placed as near the steering head as possible; a propelled shaft, flexed by two universal

joints, transfers the drive to a rear live axle, and at the fore end of this shaft is mounted a circular box containing a twospeed epicyclic gear, operated by foot pedals. The engine control—by levers and flexible wires—is mounted on the coachwork, adjacent to the driver's right hand. A geared-up starting handle obviates the difficulty of setting a single cylinder with magneto ignition into full song. The brakes consist of large compensated bands on the ends of the rear axle, and the price of a two-seater is \$420, without hood or screen. The tubular chassis is enormously strong, the side members being bent up out of the largest tubing ever seen on a motor vehicle; but probably the discomfort inherent in a three tracker will disqualify the clever little outfit from being popular on genuinely bad roads.

A Ladylike Cyclecar.

IT was curious that just after I dispatched my recent lengthy article upon cyclecars, a new vehicle should make its debut on our market, and render the need of defining a "cyclecar" doubly acute. In England it is common for a large factory to interest itself in the production of both motorcars and motorcycles, a combination unusual in the United States, and in not a few instances the same concern also runs a pushbike factory, possibly under the same roof. The Singer Company, of Coventry, has an unusually complicated business, for they have been manufacturing pushbikes, motorcycles and motorcars for years past, while a sister concern leads in the sewing machine business. The firm has now undertaken yet another line, and is producing a cyclecar. This interesting little vehicle is a miniature reproduction de luxe of the most advanced practice in automobile construction. It has a 10 h. engine (capacity under 1,100 cc.), and it weighs less than 7 cwt., but embodies every conceivable refinement applicable to automobile specification.

Details of Construction.

ITS two-seated coach-work body is mounted on a channel steel frame; the four-cylinder engine has syphon cooling, cylinders cast in pairs, mechanical valves all mounted on the same side and actuated by a one-piece cam shaft, adjustable tappets with fibre silencing pads, magneto

ignition, two-jet carbureter, and pump and trough lubrication. The transmission is by clutch and universal joints to a three-speed gear-box, bolted to the casing of the differential back axle, and five detachable steel wheels are provided. Is this a motorcycle in any sense of the word? Rumor, that lying jade, tells us several very familiar vehicles, are about to emerge from other leading factories, and as all of them which adopt the Singer weight and power limits, are eligible to compete against sidecar outfits in our motorcycle competitions, it is likely that there will be a fresh definition of "cyclecar" before the year is out.

Another New Motorcycle.

THE boom in motorbicycles has inspired several high-class firms, hitherto engaged only in the pushbike business, to dabble in gasoline, and the classiest of the newcomers is the Lea-Francis. This firm has always occupied a unique position in the international cycle market. When the average firm was trying to produce a pushbike for fifteen dollars, and dropping its price a cent or two to cut the firm next door, the Lea-Francis people pursued a policy of splendid isolation, and with a calm dignity continued to make, advertise, and—what's more—sell machines at \$80 to \$100. "Good—not cheap" was their slogan, and at various times they have adopted almost every conceivable luxury except gold-plating; for instance, they would rather make the knob of a gear lever out of ivory or ebony than of vulcanite or boxwood. It is interesting to observe their notions about a motorbicycle de luxe. It has a 3 h. V twin air-cooled engine, with completely enclosed chain drive (two chains only), countershaft two-speed gear obtained by sliding dogs, and carrying a multiple disc clutch on the same spindle; extraordinarily complete mud-guarding, kick-starter, automatic carbureter, and detachable wheels. The idea is to produce a machine which can be ridden in a boulevard suit, without the rider getting a spot on his dude garments under any circumstances.

The Detachable Wheels.

I DESIRE again to emphasize the detachable wheels, an English novelty, which has got to become universal. As my drawing in the issue of August 22 indicated, a knockout spindle is threaded into a hub made in three sections. The three sections of the hub are coupled up to each other by dog clutches; the central section carries nothing but the spokes of its wheel; when the knockout spindle is withdrawn, this central section is held only by the dogs, and drops out as soon as the main axle nuts are loosened, and the spring of the forks allows the dog clutches to disengage. The end sections of the hub ride on bearings carried by barrels permanently fixed to the fork ends. The Lea-Francis designer has ingeniously perfected the detachability of the front wheel, to which there was one obstacle—the rim brake, standard in English practice. He scrapped this brake, and substituted a dummy beltrim of small diameter, pinned to the spokes. A lever and shoe pivoted to the fork crown operate on this rim, and none of the parts obstruct the wheel from dropping out as soon as the front wheel stand is lowered, and the knockout spindle withdrawn.

The Wall 5 h. Single-Cylinder Tri-Car.

INTERNATIONAL TOUR

BY DONALD M'KIE

PART VI

WHILE completing the trip over the Simplon Pass in Switzerland, trouble was experienced by the Columbus tourists in Europe, and this, together with complications following an accident, necessitated Donald McKie's making the current instalment of the International Tour story comparatively short. In the next issue, however, there will be another long article, dealing with the experiences of the

Atlanta tourists in Paris and other French cities. The present instalment begins with the trip over the famous pass.

The remembrance of our first attempt at the Simplon Pass will not soon pass away. After a continuous climb of $2\frac{1}{2}$ miles we stopped to allow our engines to cool and at the same time to eat some fruit. The road is forty feet wide and we left our machines standing on one side, allowing plenty of room, as we thought, for another vehicle to pass. However, a horse which came along a short time later became frightened on seeing our machines and dashed to the extreme right of the road, upsetting the carriage and throwing out its occupants, one of whom happened to be the mayor of Brigue. The result was that we had to deposit 500 francs with the police department to pay for repairs, with the understanding that if there was any surplus it would be refunded to us.

That night we remained at Brigue and resumed our climb the next morning. A number of stops were necessary to cool the engines, but we finally reached the highest point of the Pass, having climbed 28 kilometers of continuous hill. As might be expected, the scenery was excellent throughout the entire trip. After the summit is reached power may be shut off for the downward coast. On completing the Pass we were again stopped by the gendarmes and relieved of our pass tickets. We had taken the required time in making the trip and immediately went to the customs office where our deposit for entering Switzerland was returned.

Poor Roads in Italy.

Further on we came to the Italian customs office, and not being able to show an international pass we were required to pay about \$16, practically all of which will be returned when we leave Italy. Fuel came rather high in Italy, but we were glad to be able to get it at all. We got our full share of punctures here, collecting eight between the three machines in one day, and an average of four a day for the succeeding days. One hill we

reached in the city of Pistoia was as bad the Simplon Pass, but not so long. The roads in Italy are far from the best.

Rome was our next stopping point of interest; on entering this city one has to go through a huge gate. We were forced to abandon our motorcycles as the streets are very narrow. After a couple of days we decided we had seen enough ruins to last us a lifetime and so left for Pisa. It took us two days to reach this point and en route we saw the Mediterranean. In Pisa we saw the famous leaning tower, certainly a wonderful creation.

Many Hills Encountered.

It was raining when we left Pisa and it continued to rain for the rest of the day. On account of the dust from the quarries the roads when wet become very slippery, in fact they were the worst we had ever encountered, and progress was very slow. After leaving Spezzia we came to a stiff hill and the machine carrying double had to shed its passenger. We encountered numerous other hills after this one, but had no further trouble. At Genoa we tried to purchase some tires but they were not to be had. Here, as in other Italian towns, drivers use all parts of the road, keeping to the left more than to the right.

We reached Susa about 5 p. m. and then started the ascent of Mt. Cenis. Had we known its severity we would never have attempted it at that late hour. We had not gone far when Hudson had a chance to show his good nature by walking, as the machine would not carry double. A rider on an N. S. U. two-speed happened along and even on low gear experienced considerable difficulty

in making the climb. It was almost dark when we reached the Italian customs office; after inspecting our machines they gave us what money was coming to us from our deposit. We remained at a hotel near the customs office till morning and then continued our climb.

The Arrival in Paris.

Hudson did not do much tandem riding until we reached the summit, which is 6,829 feet above sea level; its grades are much steeper than those of the Simplon Pass, which is only 6,585 feet above sea level. It is sixteen miles from Susa to the top, and the scenery is fine all the way. The descent was easy and we soon reached the town of Landslebourg. The French customs are located here and although we had no international pass they gave us a permit to ride in France ninety days and our entire outlay was only 60 centimes or twelve cents for the Government stamp.

The road continues downward to Modane; in fact, there is a slight downward grade all the way to Chambéry, where after a short run the mountains are left behind. We took a roundabout route to Paris, trying to avoid the larger cities and to a certain degree we were successful. We had excellent roads to within fifty miles of Paris and we made the best time of the entire trip. However, nearing Paris the roads become very poor, but the streets in the city are as a rule well paved; and they are usually crowded. It might be well to say that it is very hard to find tires; even in Paris it took us a whole day to get any that would fit and then they came high. It is best, if possible, to ship them ahead before starting a tour.

PLUGGING SAND ON NEVADA'S BARREN TRAILS

Graphic Story of a Vacation Trip from San Francisco to the Pyramid Lake Indian Reservation, Over Mountains and Through Districts Rarely Seen by Motorcyclists.

BY VOLNEY E. DAVIS

IN the following article Volney E. Davis, the record-holding transcontinentalist, of San Francisco, gives an interesting description of a recent vacation trip on his motorcycle. With Lew Golding, another Frisco enthusiast, Davis journeyed to the Indian Reservation at Pyramid Lake, Nevada, encountering widely varying roads and a thrill or two. Davis' story follows:

When my friend, Lew Golding, discovered that his vacation came at the same time that I was taking mine, he asked me to accompany him on a trip to the Indian reservation at Pyramid Lake, Nevada, to visit his uncle, and I agreed to go. Said uncle is the proprietor of the general store at the reservation and it was Lew's desire to give him a surprise. Accordingly he did not let him know of his intended visit. Lew's 1910 5 h. Indian did not appear fit to make such a trip, but he decided that with a little tuning up it would answer the purpose. I had a new 1912 7 h. Indian, which had not run more than 1,000 miles. I used the same luggage carrier that served on my cross-continent trip and carried a half gallon of oil and a generous assortment of small parts.

We left Frisco on the 6 a. m. ferry for Oakland and after eating breakfast at the latter place Lew tightened up his carrier and we took to the road. We had good going and no trouble, except with my partner's carrier, until we reached Niles (30 miles), when Lew's extra oil can sprung a leak, and after filling our tanks we had to ditch it. Everything went smoothly then and we reached Stockton (92 miles) in due time. Here we had lunch and then went on to Sacramento, where we remained overnight and part of the next day. We then continued on to Folsom, at which point the good roads so far encountered gave way to rough and rocky trails with deep sand and ruts. It was on this road that Lew got his first spill and broke off a crank. He continued to Placerville with his feet dangling, where he had the crank repaired.

From Placerville we began a long steady climb on the 50-mile grade along the American River, winding through fine scenery to the summit, which is 7,394 feet above sea level. The roads were in poor condition, with deep dust and sand and hard grades, the steepest being Slippery Ford, a 22 per cent. pull and two miles long. To make it worse the road was being repaired and it surprised me to see how well the old 1910 machine made the climb.

Records Broken for Sand.

After reaching the summit we had a 2½-mile steep down-hill grade and then deep sand to Lake Tahoe. We stayed there overnight and got a room at the Lakeside Park for which we paid \$2.50. The supper they served would not have satisfied a healthy grasshopper, and the beds were the kind that keep one awake all night. I went in the lake for a swim, but could not persuade Lew to come with me, as he claimed he did not need a bath. In justice to the hotel I must say that we had a good breakfast the next morning. Before

leaving we met a party of automobile tourists from Los Angeles.

On leaving Lake Tahoe we had nothing but sand to Glenbrook, but we took things easy, stopping every now and then to view the lake, as Lew kept reminding me that we were in no hurry, being out for pleasure and not work. After leaving Glenbrook we had an easy up-hill grade for about one mile and then followed a long sandy downward grade for nine miles. This is known as the famous Kings Canyon Road and continues on to Carson City, where we ate lunch. From Carson City to Reno we found fairly good roads with a few stretches of sand.

In Reno we were the guests of Frank Golden, one of the proprietors of the Hotel Golden, justly famous for its comfortable rooms and beds. Frank Golden is also well known as Nevada's crack sand rider. I might say here that Nevada is certainly the place for anyone wishing to practice sand riding.

A Genuine Endurance Test.

We left Reno at 10 o'clock the next morning and found good roads to Derby, where we learned that the road from Wadsworth was very bad and that by taking a cut-off and not going to Wadsworth we could avoid several miles of the bad stretch. We did this, avoiding part of the poor road, but the rest, 16 miles, kept us busy for six hours. I had no motor trouble, but broke my chain four times on account of the deep dust. The road was particularly bad at this time, as a new railroad was being built and the heavy trucks that hauled the material cut them up to a great extent. With sand, sagebrush, deep chuck holes and alkali, this section was a regular desert, with an occasional peep at the green trees along the Truckee River to relieve the monotony.

As we were going through Dead Ox Canyon I came upon the figure of a man, lying face downward in the deep dust and to all appearances dead. However, upon investigation I found him to be dead drunk and was unable to get him to move. We had a hard struggle getting out of Dead Ox Canyon and going up one steep hill, with seemingly bottomless sand, the best we could do was to let the machines pull themselves and walk alongside. I honestly believe this was the worst alkali and sand road I ever encountered.

Later we obtained some water from an Indian called Captain Dave, whom we met coming along in a big wagon with his squaw and several children. He is one of the educated Indians and talked quite freely, which is something very rare, as one seldom gets more than a grunt from the average redman. Soon after leaving Captain Dave we reached the reservation, but the tables were somewhat reversed, for instead of Lew surprising his uncle, he was rather surprised himself to learn that Mr. Golding had gone to Reno to get married, and would probably be away two weeks.

Making New Friends.

George S. Shaber, manager of the store, was not acquainted with Lew and about sup-

per time, having gone without lunch, we were beginning to get worried when George told us that there was an extra bed and that we might obtain supper at the mess hall. We found Miss Avis Chapman in charge at the latter place and received good treatment at her hands. First she allowed us to wash ourselves and then led us to the dining table, which was about 30 feet long. There we proceeded to do justice to a hearty meal.

After the meal it was agreed that we give the ladies a tandem ride, and since Lew had left his carrier in Placerville, the pleasure was all mine. I was kept busy that evening and all the next day giving, as it seemed, everybody in town a ride. The reservation is situated near Pyramid Lake, but most of the inhabitants dwell along the Truckee River, just east of the lake. The river furnishes water to irrigate the land, and it is this irrigated land that supports the population, about 1,000 in all. There are a few white people on the reservation, about fifteen men, some of whom have families.

The Indians here are the Piutes and are far ahead of any I had previously seen. There are among them Indian policemen, paid from \$20 to \$30 a month by the government. These policemen, if they may be called such, are not on duty all the time, being allowed to do other work except when called upon to make an arrest, and then they seldom fail to get their man. Captain Dave, of whom I have already spoken, is a member of the force and receives \$25 per month.

No form of religion prevails among these people. Heretofore they have had no place to worship, but a church is now being erected and they will soon have a chance to hear the gospel. They now spend their Sundays gambling, as that is the only time it is allowed. The squaws as well as the men love their cards, the former playing what might be called "near poker." They never play for more than 25 cents, while the men stake larger amounts.

One of our objects in making the trip was to go trout fishing, but we had ill luck on the lake, so spent the remainder of our time at the river, where carp and catfish were plentiful. There was one small boy, weighing only about 45 pounds, who took a great delight in fishing, and when he got a two-pounder at the end of his line it was interesting to watch him tug away for some time and finally call for help. We had many pleasant and novel experiences that I would like to tell about, but it will suffice to say that on all my trips I never had a better time or received more generous treatment.

The return trip was no less venturesome than the outbound, but the experiences were somewhat similar. We followed the same route to Reno and then went by way of Truckee, Donner's Lake and the big grade, and found the roads to be much better than via Placerville. We had lunch and some ice cream at Colfax, and then rode to Auburn and Sacramento. From Sacramento to San Francisco we followed the same route as when outbound and arrived home on August 24, having been away twelve days.

NE of the foundation stones of the motorcycle industry is found in the United States patent system, the object of which, broadly speaking, is to encourage progress by guaranteeing to inventors and designers the fruits of their originality and ingenuity. And, because of this very influence which exercises a protectorate in behalf of experimenters and manufacturers who make

new discoveries calculated to benefit motorcycle users, it is interesting to note that there is impending at the U. S. Patent office at Washington a change in jurisdiction and procedure that should mean much to the motorcycle trade, directly or indirectly.

This prospective improvement is to be brought about by what is known as a "re-classification" affecting the handling of motorcycle patents. To appreciate the significance of this it is necessary to glance at the plan which Uncle Sam has followed in handling motorcycle inventions during the score of years which may be said to represent the span of the motorcycle industry. And just here it may be noted, to the probable surprise of many readers, that the United States Government has, to date, granted more than 175 patents on motorcycles. A yet greater number of inventions in this field have been submitted to the Federal experts in an effort to win patents, but a number of these applications had to be rejected because they did not cover real or practicable inventions. Practically all of the more than 175 patents which have been taken out on motorcycles are, moreover, the property of Americans. Our Yankee inventors and designers of motorcycles have been so far ahead of their foreign competitors that there has been little chance for foreigners to secure patents here. However, there are on file at the Patent Office, for purpose of reference, a considerable number of foreign motorcycle patents—that is patents taken out on motorcycles in various foreign countries, it being now the custom of leading nations to exchange copies of patents issued in order to afford complete international files.

How Motorcycles Are Classified.

At the U. S. Patent Office the examination

of inventions to determine whether or not they are patentable is conducted by forty-three divisions, each division being in charge of an expert "examiner" and several assistant examiners, and each division concerning itself only with inventions in the one particular industrial field upon which its officials have specialized and upon which they are considered authorities. But strange as it may appear, there is not an examining division devoted to motorcycles, nor yet to motor vehicles in general, although this is in effect the object of the reclassification now in progress and which has already been referred to.

The only explanation of the present state of affairs is that Uncle Sam often moves slowly in the matter of innovations and the motorcycle industry, like the whole automobile trade, has developed so rapidly that the Patent Office was caught unawares, so to speak. When motor vehicles began to become a factor in the transportation world there was already in existence at the Patent Office an examining division devoted to "Carriages and Wagons," and all motor vehicles were placed within this jurisdiction, and there they have remained ever since. Of course, the capacity of the division has of necessity been greatly increased, owing to the tremendous activity of invention in the motor vehicle field and experts have qualified specially to pass judgment upon motorcycles and automobiles, respectively, and devote their entire attention to these lines. However, the general title of the division has remained as in the days when carriages and wagons were the most popular vehicles. There may be no change in this respect, even after reclassification—that is, for instance, no special division may be created for motorcycles—but at least there will be subdivisions for motorcycles and other forms of motor vehicles within the present main division, and this definite apportionment of responsibility is expected to facilitate the examination of inventions and the issuance of patents, as it will certainly simplify the keeping of the archives of the office, and thus will save time and labor for inventors, manufacturers and others who may have occasion from time to time to consult the records and files of motorcycle inventions.

Many Shock-Absorbing Devices.

Not all the patents covering inventions in the motorcycle field are issued as the result of examinations by the division just mentioned, although the great majority of motorcycle inventions follow this course upon

reaching the Patent Office. The most notable exceptions are those inventions which concern, say, the frame of the motorcycle and which go to an examining division created years ago to handle "velocipedes," and which is still operated under that rather obsolete title. Many of the patents taken out some years ago on bicycle frames were passed on to the motorcycle industry, the inventions being as applicable to the newer type of cycle as to its predecessor, but there have, of course, been some brand new inventions in this field. Lately, however, motorcycle design has been so tending toward standard form that there has been a gradual diminution of applicants for patents on novelties in frames. The one line where inventors are yet busy is that which involves the problems of shock absorption. It is interesting to note, however, that the air-cushion principle has, judging from current patent application, been largely abandoned as a solution and the efforts of inventors appear to be now concentrated on springs in one form or another.

As the inventions that concern themselves with motorcycle frames are examined in a division apart from the main motor-vehicle section, so likewise are starting devices, etc. Electrical devices designed for use in conjunction with a motorcycle are passed upon in yet another division, and so it is through the entire list of accessories. Speaking of the use of electricity in connection with motorcycles, it may be mentioned that on the oldest of the "freak" motorcycle inventions for which a patent was ever sought was an electrically operated machine in which the current for operating the cycle was to be generated by the pedaling of the rider of the machine. This was one of a number of motorcycle inventions which, while mechanically eligible and consequently patentable, were impossible from the commercial standpoint.

First Motorcycle Patent.

It may be surmised from this mention of the electrically operated machine that by no means all of the 175 motorcycle patents which have been issued covered inventions approximating the motorcycle as we know it today. Not only have the inventions shown range or variety in the matter of propulsive power, but there has also been much latitude as to the appearance of the vehicle itself. It has, generally speaking, been the rule of the officials to admit to the motorcycle category every form of motor vehicle with two wheels or two main wheels.

A search of the secret archives of the Patent Office would seem to indicate that the pioneer invention in the motorcycle field—or at least the forerunner of all our present-day motorcycles, was patented in the year 1872. It was designated as an "improved velocipede," the improvement being found in the fact that it was a power machine. In this early attempt, steam power was provided, a rather cumbersome engine being supported on the frame between the two wheels. The use of the gas engine in this connection does not seem to have been embraced in any patent until the year 1888, and even after that the progress of invention in this field was quite slow until 1895 and 1896, when there was inaugurated that activity on the part of inventors in behalf of motorcycle invention which has been continuous ever since.

Many "freak" inventions have been submitted from time to time in an effort to secure motorcycle patents, although the number has not been nearly so great as in certain inventive fields as, for example, those where the "perpetual motion" ambition has had reign. One of the most fantastic of all the "freak" motorcycle inventions that have reached the Patent Office in recent years was that which called for the suspension of the cylinders in the position of spokes in the rear wheel, it being necessary, of course, for the cylinders to revolve with the wheel.

The Trend of Improvements.

The present trend of the motorcycle industry, as reflected by the applications reaching the Patent Office is all in the direction of greater compactness of the power plant and added reliability. It is evident too, by this same method of taking the pulse of the industry, that increasing attention is being paid to the element of general appearance in a motorcycle. It may be added that all such new departures are covered by what are known as design

patents to cover mechanical features only. The number of design patents on motorcycles taken out within the past year or two shows a marked increase, and it is the expectation that this will be the sphere of greatest activity in the future since there would seem to be little room for further mechanical patents except for minor improvements, etc.

The reclassification now in progress that will affect the examination of motorcycle inventions will benefit motorcycle inventors and manufacturers, and, indirectly, motorcycle users, but additional benefit will undoubtedly be conferred by a reorganization and modernization of our whole patent system that is now in progress. Congress in the closing days of the last session appropriated the sum of \$10,000 to enable the President's Commission on Economy and Efficiency—a body of "business doctors" and authorities on system—to thoroughly investigate the Patent Office as to methods, personnel and equipment. This investigation, the verdict of which must be submitted to Congress in the form of specific recommendations next December, is expected to provide a working basis for a thorough overhauling of the patent system. The improvements to be introduced will tend to quicken the whole procedure of the Patent Office, but at the same time will allow more careful examination of applications for patents with the result that the validity of patents will be strengthened and manufacturers will presumably be spared many such legal contests as now develop over questions of infringement.

New Building in Prospect.

Another prediction that may be confidently made in this connection is that the country will ere long be provided with a new Patent Office and one adapted to the needs of the greatest inventive nation in the world—a nation whose people have taken out a total of more than one million

patents, or probably one-third of all the patents issued in the world. The present Patent Office has long been inadequate and gradually the congestion due to the accumulation of records and documents has increased until now the limit has been reached. From cellar to attic every inch of available space in the present building is crowded with the archives. Most of these papers are on open shelves, exposed to the ages of time and, worse yet, they are ever menaced by fire, the Patent Office building not being a fireproof structure. The loss of many of the documents of file—not only original patent papers but also records of deeds of assignment covering inventions sold or transferred by the original inventor—would be irreparable to manufacturing interests as well as to the government. The plan is to erect a new Patent Office building of liberal proportions at an expenditure of several million dollars and, as a stop-gap to tide over present needs, to build a one-story building in the court of the present Patent Office that will afford storage space for the ever-expanding document files until a permanent new home can be provided.

Registration of Trade-marks.

The motorcycle trade not only relies upon the patent system to protect its designs and mechanical inventions, but also for the registration of the trade-marks which are valuable assets in this industry as in many others. Dozens of trade-marks in the motorcycle and kindred trades have already been registered and the number is constantly growing. Fanciful names and the names of individuals or manufacturing firms seem to have been much favored by makers of motorcycles. The Patent Office has been obliged to refuse registration to some names in the motorcycle field, however, because of the rule that geographical names will not be registered as trade-marks. Officials of the Trade-Mark Division of the Patent Office say that of all manufactured products none are better adapted than motorcycles to the carrying out of the requirement that a trade-mark shall be prominently displayed on the goods that it is designed to identify. Names, initials, etc., are particularly effective as trade-marks if distinctively displayed, as on most motorcycles.

One of the Busy Departments in the Patent Office and an Exterior View of the Patent Building.

How I Became A SIDE-CAR CONVERT

PHILIP H COX

MY first experiences with a motorcycle were begun in the summer of 1910, with a 1910 Excelsior 4 h. battery model, and such experiences as they were; I am sure I sampled all the fool stunts known—from pedaling around the block with the battery plug in my pocket to pushing the machine home after working over it for several hours, only to find on arriving home that my gas tank was empty. Previous to buying my Excelsior I had pushed a Pierce bicycle 11,500 miles in five years, so you see I certainly did love this method of seeing the country, as all my riding has been done purely for pleasure. But by 1910 I noticed that motorcycles were giving much more satisfaction to the fellows than previously. About this time I noticed a funny feeling coming over me whenever I saw a chap go shooting by on a motor, particularly if I happened to be pushing my wheel up a hill. Up to this time I was almost prejudiced against motorcycles, because most of the fellows I knew who had machines were continually complaining of the trouble they were having.

One evening I met a friend of mine who had just got home from business on his Excelsior 4, and after he had said a lot of nice things about his machine and motorcycling in general, he turned sharply to me and said, "Say, you needn't take my word for it, get on and try it for yourself." So he explained the grip controls and told me there was practically nothing else to it, any more than riding a bicycle. Well, I finally got started on a slight incline and kept going for about five miles up and down hill and I suppose I will never forget the

thrill of that first ride on a real motorcycle—to see a big hill directly ahead and not have to strain a bit, but only turn a grip a bit and feel the machine jump as though it were alive was something new and decidedly pleasant. There was very little sleep for me that night and for a good many days and nights afterward I could not get the fever out of my head. I had it so bad that I would hold up anybody I met on the street who I thought might know something about machines, till I was finally told by a good friend that the only cure for my trouble was a motorcycle.

The Purchase of a Mount.

By this time I knew that a motorcycle that I could call my own was the only thing that would enable me to get down to a normal state of mind and give my friends a rest, but I was also aware that my "better-half" would object to my drawing \$225 out of our treasury for a machine that was to benefit only one member of our family of five. So I

talked the matter over with a friend of mine, who said he had faced the same kind of a problem when he wanted to buy his first machine and that he solved it by telling his wife that he would put a tandem seat on and take her too. So I "doped" out all the nice things I could about riding a motorcycle a la tandem and sprung it all at once when I saw a good chance. Say, fellows, it worked fine. My wife said, "Why, yes, I think it would be fine to get out and see the country and visit many of our friends that we could not find time to visit by the ordinary methods of travel." Well, you can bet I made a bee-line to the motorcycle shop for the mount I had had my eye on for the past month, and hustled it home. As I have already stated, I rode 10,000 miles on this machine in the two years following, and of this distance my wife rode on the tandem seat for about 4,000 miles. This, of course, was a pretty fair showing for both of us.

By the spring of 1912 I found myself riding alone most of the time as our household cares had increased in the past two years so that my wife found it difficult to get more than two or three hours at a time away from home, and as she had to dress especially for tandem riding and then change when she arrived home, she often thought the trouble of getting ready was hardly worth while, considering how short

of five. So I

THEN AND NOW.

The small picture at the top shows the method adopted by Mr. Cox in the bicycle days. The large photographs below require no explanation. They tell their own story.

a time was left to ride. Then again my three children were growing up and I realized that I was spending practically all my spare time on the machine while I knew I ought to spend more time with them. These thoughts disturbed me every time I took a ride and I used to come home feeling I had done my family an injustice by acting so selfishly. But I did not know what to do about it; I did not know how I could give up riding as it had become second nature to me, and I could not afford an automobile. But one day a friend who had tried my suggestion of taking his wife on a tandem seat and who had failed to please her, told me he had solved the whole problem by getting her a sidecar.

Sidecar Solves the Problem.

You may imagine I got interested at once, and began to investigate this sidecar proposition for all it was worth. We soon were bringing out all our old numbers of *MOTORCYCLE ILLUSTRATED*, and eagerly waiting for each new number that might show photos or articles on sidecars. I also got into communication with everybody I knew who had a car, to learn from an unbiased source just what the riders thought of them. I soon became convinced that while a sidecar is not mechanically perfect, it was entirely practical for my purpose. After consulting about fifteen men who owned and operated sidecars, I arrived at the following conclusions, viz.:

First: That for ordinary give and take country roads, I ought to have not less than a 7 h. machine.

Second: That I should by all means avoid using a flat belt for transmission; a V belt will pass, but the chain is ideal.

Third: That a two-speed gear is a great convenience at times, but with a good clutch one may navigate all ordinary roads.

Fourth: That owing to the peculiar side strain put upon the sidecar where it connects to the motorcycle, extreme care must be exercised in determining the make of car to use, as a break at any one of the three or four points of connection, while riding, might prove very serious.

We finally decided on a Harley-Davidson 7 h. chain-drive, with free engine clutch and an M. M. sidecar. The whole outfit weighs just 380 pounds, the sidecar making up 100 pounds of this. You will observe by the photo that there are five of us on board at once. Our total weight, not counting the machine or car, is 390 pounds, making a total of 770 pounds for our engine to pull. I have taken this load all around North Jersey within a radius of 30 miles of Montclair and those of you who have been through this section when your compression was not just right know that our roads are far from being level; yet we have been able to climb all the hills so far. We have only ridden our new machine 700 miles, but the whole family is thoroughly in love with it and "Pop" never has to ride off alone.

As near as I have been able to determine so far, we get from 40 to 50 miles per gallon of gas and about 100 miles to a quart of oil. A friend of mine who has the same make of motor and sidecar told me that with a passenger in the sidecar weighing 190 pounds, his speedometer has registered 45 miles per hour at maximum. So you see there is plenty of reserve power for all ordinary purposes. I have found sidecar riding to be much more restful on the nerves, as one does not have to worry much about skidding or maintaining balance; and owing to the load, it is easier to ride slowly and see more of the country.

BROOKLYN INVINCIBLES.

At the last regular meeting of the Invincible M. C., of Brooklyn, N. Y., the members kept their enthusiasm in check long enough for a photographer to get in his work and the accompanying picture is the result. In the back row, from left to right, are Thompson, Zechiel, Chase, Graves and French; in the center row, left to right, are Warlick, Vine, Constant, Vail, Mann and Nason, and in front are Washburn, Aiken and Livingston. The photograph is by Stout, one of the club members.

CLUB INCORPORATES.

The directors of the Invincible Motorcycle Club, of Brooklyn, N. Y., which was incorporated October 9, are as follows: H. E. Stout, 251 Lafayette avenue; F. H. Chase, 230 St. James place; R. F. Graves, 703 Sterling place; J. B. French, 247 East 3d street, and E. C. George, 149 Remsen street, all of Brooklyn.

The Indianapolis (Ind.) M. C. recently held its first annual endurance run to Spencer, a distance of 130 miles.

BOOSTING FOR DENVER.

Boosters in the Short Grass Club, of Kansas, want to see the 1913 convention of the F. A. M. held in Denver and they are preparing to work up a campaign with a view of bringing the big assembly to the Colorado city. Should the assembly be held there the 1913 tour of the Short Grass riders will be started at Kansas City with Denver as the turning point.

ANOTHER CLUB IN CLEVELAND.

The West Side M. C. is the name of a new motorcycle club that has been formed in the Sixth City. W. H. Simpson has been elected president. Meetings will be held every Wednesday at 7706 Lake avenue. It is not an F. A. M. club at present, but it is the intention of the riders to affiliate soon.

A MOTORCYCLE club was recently organized in Mobile, Ala., and the following officers were elected: Edward Kocher, president; M. M. Wilinon, vice-president; V. W. Root, secretary-treasurer. Ben S. Stanley was chosen captain and P. S. Bacon and W. R. O'Dell lieutenants.

Henry Mesinger (at Left) with Department Heads and Employees at Dedication of the New H. & F. Mesinger Factory, Which Was Followed by a Banquet.

A YANKEE ON EUROPEAN ROADS

MAXIMILIAN ST. GEORGE

IN the present instalment of his article on European touring conditions, Maximilian St. George, the Chicagoan who is now riding on the continent, deals principally with Italy. He reports that good roads are scarce and gasoline rates exceedingly high, but striking scenery has to some extent offset his troubles along the route.

My motor was working so well that I decided to leave Innsbruck that evening and travel over as much of the pass as possible. The ascent of the Brenner Strasse, with fine scenery on all sides, begins immediately after leaving Innsbruck. I passed through Schupfen, 2,300 feet above sea level; Schoenbergerhof, 3,200 feet, and Matrie, 3,300 feet. On this pass, contrary to the custom on other roads in Austria, vehicles keep to the right and in rounding one turn, I barely missed a collision. It was a pretty sight to see the lights of Innsbruck and the nearby villages from so high a point. I passed one wayside shrine in front of which a light was burning and it impressed me deeply. It is not an uncommon sight in Austria and Bohemia to see shrines, statues of saints, crosses and crucifixes along the roads. At Matrie I stopped at a large gasthaus over night. The gasthauses of the Tyrol are much more pleasant and the accommodations better than those in Bohemia and Germany.

The next morning I had passed through Steinach and Gries, when my engine refused to pull and I had to walk a few hundred yards to the top of the pass, 4,500 feet above sea level. The descent is through excellent scenery via Gossensass, Sterzing, Mauls, Franzenfester and Brixen to Bozen, on the Eisach River. I had to ford a dozen brooks and the inner tube of my rear tire was punctured three times. While repairing one of these punctures a couple of English cyclists who were touring this section gave me some assistance.

Franzenfester is a fortress and taking pictures is strictly prohibited. The glaciers of Stubbaythan are visible from Sterzing. Brixen, an ecclesiastical capitol, is already semi-Italian, as is Bozen, which lies in one of the finest Tyrolese glens. A good road traverses a narrow valley between Bozen and mountain-girdled Trent and passes through Neumarkt, Salurn and San Michele, all of which are Italian towns. The road is very good through this land of sunshine and wine, and for the first time on the trip I was able to ride with my mantle off and feel comfortable. I continued on through Ale, Rovereto and along the Adige River to Borghetto, at which place the customs official certified that my machine had left Austrian soil.

Italy's Low License Rates.

A moment later I came to what might be called the customs outpost. An officer here wrote out a description of my motorcycle and then sent me on in company with a carabinieri (a guard) to Peri, where the main customs

office is located. The carabinieri allowed me to go ahead and the official at Peri seemed surprised at seeing me alone; when the carabinieri arrived later the chief severely criticized him for allowing me to get out of his sight. At first the official insisted that I make a deposit, but after showing him my customs ticket and membership card in the Automobile Association he finally made out a pass allowing me to ride in Italy for three months and the entire cost was about five cents. It is cheaper to tour in Italy on a motorcycle than on a bicycle. While waiting for my permit to be made out I prepared to take some pictures, but had no more than taken my kodak out when a soldier, followed by a number of officers, came out and for a while I was afraid I would not be able to retain my kodak.

After being detained about forty-five minutes I rode along the Rapid Adige, through Dolee and Volargne to Verona. Some fifteen miles from Verona the mountains almost meet and the road is protected by a fort and a drawbridge. From this point I had a fine broad road. I stayed at Verona overnight and received fine accommodations at very small cost. I continued on the next day to Gabbia, where they refused to cash my American Express money order, so after purchasing some gasoline I took the road for Bologna, 80 miles away. I passed through a number of small villages over splendid roads. A short distance from Poggio Rusco an automobile overtook me and left such a cloud of dust that I was blinded for a moment and rode full speed into a ditch. The forks of my machine,

already weakened by many falls, split at the axle and the gasoline filler on the tank broke off.

Roads Poorly Marked.

I finally proceeded to Poggia Rusco where I found a mechanic. I showed him my purse, containing one lira and seventy-five centesimi, told him that was all the cash I had and asked him if he would repair my machine for it. He laughingly agreed. At noon a young merchant who happened to be in the shop, invited me to his home for dinner, where I enjoyed a hearty meal.

At 4.30 p. m. my machine was ready and I continued to Bologna, passing through Mirandola and San Felix. I was directed by shorter and poorer roads through Cuorleone and San Giovanni, where it is difficult to keep to the route on account of the many crossroads, with no directing signs. In Bohemia a large stone with the names of the towns painted on it shows the traveler which course to take and in Styria and the Tyrol, iron posts carry signs giving full directions. When I reached Bologna I was still unable to get my American money order cashed. Fortunately I had some American gold for which I obtained Italian money.

The next morning I bought four and a half kilos of gasoline at eighty centesimi a kilo, this being a much better and cheaper way than buying by the litre. I then started on as hard a run as I ever hope to make. The Patiossa Pass was bad going and I had to push nearly all the way. Liberal doses of gasoline in the

A Bird's-Eye View of Naples.

Famous Funicular Railway, in Italy.

clutch and cleaning spark plugs helped a little. Then came the La Futa Pass, which almost caused me to give up. The country here is wild, barren and mountainous and the roads are very poor.

Repairs in Florence.

I reached Florence about 3 p. m. and was escorted to Cook's, a money exchange, by an English-Florentine. On the way he told me there was an Indian representative in Florence and directed me to his shop. I lost no time in visiting him and he soon found the difficulty in the slipping of my clutch. He made repairs and after a test I was glad to pay him twenty-five lire, or \$4.83. While he was working on the clutch I made some minor repairs and soon had the machine in fine order.

I left the city for Silnna by the Porter Romana, and with my engine running well again traveling was a pleasure. From Silnna, a city of ups and downs, I took the Val di Chiani road to Cortona. The country in this section is very hilly. All the towns along my route were located on peaks or along mountain sides, this being done in olden days as a precautionary measure in case of war. Among the towns referred to are Cortona, Perugia, Terni and Naples. The road descends from Cortona to the beautiful Lake Thrasymene and passes on to Magiore with its forts and walls; thence through the Val di Chiani to Perugia and under the ledge of the bold rock upon which the town of St. Francis of Assisi is perched.

Foligno, Trevi, Spoleto and Terni were passed and then I rode along the River Tiber to Campagna and Rome. I put up for the first night at a lodging house, but the following day obtained a room at the Hotel Trevi. There are numerous delightful excursions for the tourist from Rome, such as along the Appian Way, which passes by old aqueducts, Roman tombs and many ruins, to Frascati, and thence to Tusulurn, Cato's birthplace. It is in this section that one sees some of nature's masterpieces and the motorist will find something worth while all the time he is there. Rome is well cut up with canals which sometimes take the place of streets.

The road from Rome to Frascati (not the Via Appia) is the worst I have ever seen. From Frascati south to within three miles of Velmontone it is one mass of stones; there it improves through St. Agatha, Fernetino, Frosinone and Cyprano to Aquino, Juvenal and Cassino. After passing through other small towns I climbed for an hour and a half to reach the monastery; it is possible, however, to make it on a motorcycle. Near Cyprano are the falls of the Liris and Cicero's villa. Here a man wanted to charge me one lire and twenty-five centesimi per litre, or \$1.20 per gallon, for gasoline. A native advised me to get it nine miles further on, but the distance was twenty-one miles and just a half mile from Cassino my fuel gave out and I was towed into town by a passing team.

Gasoline Comes High.

In Cassino I was obliged to get gasoline at 86 cents per gallon, and throughout my stay in Italy found the price of fuel almost prohibitive. A few miles from Cassino I stopped for the night at an inn at Osteria. The proprietor was an Italian who had worked in London and therefore could speak English. A good supper, bed and breakfast cost me three lire. The next morning I continued on to Caianello and Teono and to Capua over poor roads. Bicycling is very popular in Italy, but motorcycles are rather scarce and they are very unpopular with the horses and mules. In crossing a railroad track outside of Teono I met a heavily laden truck drawn by a mule, who upon seeing my machine became frightened and jumped to one side of the road; the truck slid down, struck a telegraph pole and turned turtle with the mule dangling in the shafts.

From Capua to Naples the road was even worse than from Rome to Frascati. It was a mass of bumps, ruts and stones covered with dust two inches deep. My engine was going in spasms and gasping and the carbureter was full of dust and would not operate properly. I proceeded to Naples and then along the rough stone-paved streets to Resina and Torre del Greio; to a point within three miles of Castellommare-Stabia the road was bad.

While I was riding behind a carriage in one

of the narrow streets of Castellommare, a boy ran out of a doorway and darted in front of me. He fell and became wedged under my engine. His mother picked him up and then began pulling at my clothes so that I thought she would pull them off and at the same time screaming at the top of her voice. It did not take long for a large crowd to gather about me and from their menacing looks I figured I was in for trouble. Just as some of the boldest were about to begin action six gendarmes rushed up and without explanation marched me off to the city hall and locked me in.

It was not long, however, before they received news that the child was not injured, whereupon I was released and escorted to the home of a friend by one of the gendarmes. I do not know whether he was sent along as a matter of courtesy or protection. I stayed at my friend's house for some time, cleaned my carbureter and took many short trips to nearby towns and cities. In the carbureter I found sand, grit and plenty of water; the gasoline that costs so much in Italy is well watered. One of the most remarkable excursions I have ever taken was to Posilippo, along the sea and past the islet of Nisida where I saw some beautiful scenery and some of the oldest Roman and Grecian historic ruins.

(To be continued)

OPPOSING UNREASONABLE TAX.

CALIFORNIA motorcyclists are endeavoring to down the proposed tax that several counties plan to levy, and as a result a campaign has been inaugurated to have the members of the next session of the legislature pass a state registration law that will protect the riders from paying special fees when riding from county to county. As it is the riders are forced to pay a fee of \$2 in order to ride in Golden Gate Park and a similar fee in Los Angeles. It is now intimated that Oakland, Berkeley and several other cities are planning to pass like ordinances which would require a small fortune for the rider to ride in various towns.

ON TENNESSEE ROADS.

PATHFINDING in Tennessee is anything but a soft proposition, according to Frank Crayton, who forwards the photograph below, and Crayton should know whereof he speaks, in view of the fact that he has recently been appointed district manager in charge of a

squad of pathfinding motorcyclists in the employ of the Scarborough map-publishing company, of Indianapolis. The accompanying picture affords an idea of the country through which Crayton has been piloting his Harley-Davidson of late.

SOME EXCUSES *I have heard*

Transcribed by
L. L. GOODMAN

by The MOTORCYCLE COP

"Of all the excuses I have ever heard," said George Stone, the popular Indianapolis motorcycle policeman, in recounting some of his experiences, "the one I bumped into last week is the most original. The motorcycle speed fiend in question asserted that he thought I was a holdup man, and that he was trying to escape me. However, there are many other novel excuses.

"The speed limit in Indianapolis is 15 miles per hour, and all the cases I mention, of course, refer to violators of the speed ordinance. My advice to motorcyclists who are fond of speeding is this: If you are not absolutely certain you can lose the policeman who is chasing you slow up quickly instead of 'hitting her up.' In that way you may get off with a minimum fine, for the price we charge in Hoosier Town for educating speedsters is a dollar a mile; that is, miles per hour and costs. For example, if a man is caught traveling 40 miles an hour he is fined \$40 and costs, which make \$50 altogether. Most riders, therefore, find that it pays to keep within the speed limit. However, I'm getting off the subject.

How the Judge was Impressed.

"Now, the rider who said he thought I was a holdup man didn't live in the country, as you might think; he was a citizen of Indianapolis. He was going 46 miles an hour when I finally caught up with him, and I had chased him nearly a mile. He was twice my size and shouldn't have been afraid of me even if I had been a robber. The excuse didn't go well with me so I took the rider down to see the judge. Strangely enough, however, the story impressed His Honor in court the next morning, and it saved the offender \$41. It was the first excuse I ever heard that was good for anything like that amount. The judge was lenient with the rider and assessed him just \$5 and costs, or \$15 altogether, when it should have been \$56. That man was a clever talker.

"Probably by the time the 'I-thought-you-were-a-hold-up-man' excuse breaks into print, it will have become even more popular than the one which is worked overtime nowadays, namely, 'my throttle was stuck.' It really is remarkable how many speedsters have trouble with their throttles and can't stop. Not long ago, while I was riding through the streets looking for speeding offenders, a motorcyclist shot out from a cross street and I turned quickly and followed. The rider looked back and saw me, and knew that I was a motorcycle policeman even though I was wearing citizen's clothes, which, by the way, I always wear. The chase was a long one, and I had a hard time overtaking the rider, since we had the same kind of machines. Finally I drew up beside him and flashed my badge.

"'Stop!' I ordered.

"'I can't stop!' he cried. 'My throttle is stuck!'

"'Throttle or no throttle—stop!' I shouted again.

"On this second order he stopped all right, and quickly, too. I have known some riders who said they were 'adjusting their carburetor,' and that their 'throttle was stuck,' and they couldn't stop until I gave them the third command; but most of them get their throttles in great working order at the second order. Only once did I have to use stronger measures to stop a throttle bluffer. After I had asked the offender for the third time to halt, I pulled my gun and threatened to shoot his tires. Then he stopped. He was going close to fifty miles per hour, so his fine was about \$60 when the costs were figured in.

Calling a Doctor's Bluff.

"Generally speaking, physicians are the most frequent offenders. They often abuse their privileges. Motorcycle officers usually make allowance for the speed of doctors on emergency calls, but they won't stand for anything unreasonable. I stopped a physician one day who is a motorcyclist; he was making 42 miles an hour.

"'Where are you going at such a pace?' I asked.

"'Why—er—I'm answering a hurry call,' he replied.

"'All right,' I said, 'I'll just go along with you, and when you finish this call you can take a ride with me.'

"Well, we made the call together, and when the doctor went into the house to see his patient I followed, just to see how urgent the case was. Here's the funny part: there was no one ill at all in that house. The doctor lived there himself, and was just going home for lunch.

"'I don't see anybody dying in this house,' I said, after I had looked around.

"'No, you see, I—' he started to frame up an excuse. 'Now, say, old boy,' he went on, 'you see the position I'm in. You were smarter than I thought you were.' We left the house together. Then came an attempt to bribe me.

"'Say, Mr. Stone,' he pleaded, as we left the house, 'I hate to appear in court. Now I don't want you to take me in the wrong way, but couldn't you use a good suit of clothes?'

"'Sorry, sir,' I answered, 'I'm not on the market.'

"I think altogether it cost the doctor \$52. It should have cost him more, but I didn't report the last offense—the attempt to bribe me. Bribes fly thick and fast at the motorcycle policeman, and some of the offers are very tempting. However, I have found that it pays to turn them down.

One Offender's Lucky Escape.

"Only once do I recall that a motorcyclist escaped after I had given chase. It was a thrilling race, and I was within ten feet of the speeder—almost had him in my grasp—when bang! my chain broke. I called a repairman and I never saw that rider again. I probably wouldn't know him if I did see him, as I ate dust for that whole trip. However, this experience shouldn't lend any encourage-

ment to riders, for the offenders seldom get away. Our motorcycles—I speak of the officers' machines—are kept in racing trim, so naturally we have the advantage when it comes to a sprint.

"The nerviest speed fiend I ever encountered was a motorcyclist. After I had brought him to bay, we stopped and had a talk. He tried to work on my friendship.

"'Come on, Stoney,' he said, 'let me go.'

"'Nothing doing. Turn around and come with me, old boy,' I said. 'We are going down.'

"'All right,' he said, as he jumped on his machine. 'Let's go.'

"Well, that rascal started out faster than ever, and when I started to chase him again I found that I was out of gasoline. He had turned it off while we were talking! By the time I got the gasoline running well again the rider was a quarter of a mile ahead, but I got him all right, and when he appeared in court the same afternoon he found the trick a costly one.

Playing a Risky Game.

"I want to tell just one more story before I quit," said Officer Stone to the scribe. "It concerns an accident I had late last year which nearly put me out of business. I was running 55 miles an hour after a motorist and was gaining rapidly. When I was within one hundred yards of the speeder I began to watch my speedometer. When I looked up again I saw something that scared me green. There was an automobile standing in the middle of the street just about eighty feet ahead of me! I was too close to it to get out of the way, although the motorist had passed around it, so I put on my brakes with full force. My motorcycle skidded 70 feet, and then came the crash. My machine was smashed to pieces, a fender and one front wheel were torn off the automobile, and as for myself, I went sailing through the air fifteen feet off the ground. I went clear over the automobile, and when I came down—well, I don't exactly remember that part.

"The boys say they took me to the hospital in the police emergency wagon, and that I raved for two weeks. At any rate I didn't make another arrest until six weeks later."

OFF FOR LOS ANGELES.

HUGH FARGO, a writer and photographer, and Charles Crawford, a motorcycle salesman, left Atlantic City, N. J., on September 19, on a Henderson motorcycle, riding tandem, for Los Angeles. They carry a message from the mayor of Atlantic City to the mayor of Los Angeles. One of the objects of the trip will be to transact Henderson business at points along the route.

MR. AND MRS. E. A. MCCARTHY, of St. Joseph, Mo., made a trip to the Indian factory at Springfield, Mass., recently, when Mr. McCarthy contracted for his next season's allotment of machines.

LIGHTWEIGHTS.

A DISCUSSION recently taken up in England as to whether extreme lightness or power should receive first consideration in the manufacture of ladies' motorcycles brings us to a realization of the fact that not the slightest concession is now being made in this country to provide women riders with a solo mount adapted to their needs. That this is a proposition which must be approached gingerly goes without saying, but we believe the American field has developed to the point where certain minor refinements in the lighter models may at least be considered, in the interests of the ladies. Several years ago both the Reading Standard and the Wagner companies marketed light, drop-frame singles, rating somewhere inside three horsepower and quite equal to all the requirements of feminine enthusiasts, but sales of these models were comparatively few. It is only fair to admit, however, that these machines were launched at a time when the woman rider was a rara avis, and when public sentiment was set sternly against her. Times have changed and the feminine pilot of the solo mount is now coming into her own. It is obvious that even the lighter singles—of standard design—do not meet her requirements, but at present she must either content herself with these or forego solo work. What are we going to do about it?

HILL-CLIMBING LULL.

WHAT has become of the motorcycle hill-climb on this side of the Atlantic? The season just closing has developed very few events of this character, and these it must be admitted were staged with considerable indifference. Some time ago hill-climbs were found fairly well sprinkled throughout a season, and that they contributed not a little to the practical advancement of the motorcycle is certain. While we have been giving hill events a nonchalant go-by in this country our British cousins have been making the most of them.

Your Englishman wants every ounce of sporting interest out of an event to which he gives his serious attention, and the hill-climb—combining speed, sensational cornering and all the elements of keenest competition—meets his requirements. We have hills aplenty on this side and machines to climb them. All that is needed is systematic arranging and handling of programs. The hill-climb has never been given a fair run for public favor in the United States, and F. A. M. clubs might well give this phase of the situation careful thought.

**AFFIDAVIT OF
OWNERSHIP AND
CIRCULATION**

In compliance with the provisions of an Act of Congress adopted August 24, 1912, the publishers of **MOTORCYCLE ILLUSTRATED** have filed with the Post-Office Department the following affidavit of ownership and paid circulation.

BETTER PROTECTION.

DURING the last month no less than a dozen minor accidents, due primarily to the riders taking unfamiliar turns at speed, have emphasized the necessity for a movement looking to more adequate protection for motorcyclists at danger points. That every turn should be made cautiously goes without saying, but the roadster who coasts down a long, smooth hill, for example, is quite likely to take conditions for granted until it is too late to avoid a spill and possible injuries. A distinctive warning sign placed at the top of the grade would at least put him on guard. Automobile organizations have posted many danger points in this way, but usually only on main touring routes; besides, the experienced motorcyclist is apt to disregard an automobile sign in the belief that his single-tracker is capable of negotiating many a corner that would give a four-wheeler trouble. In other words, a warning for motorcyclists must be aimed directly at them, if it is to serve its purpose.

ULTIMATELY the posting of these signs with special regard for the requirements of motorcyclists, will come within the province of the F. A. M. Touring Bureau, but some time must pass before the Federation will be enabled to take up this task on a systematic basis. In the meantime, it would be well for clubs throughout the country to assume responsibility for the posting of signs at the more deceptive danger points in their respective districts. Two or three such signs could be carried on a club outing or sociability run and placed where the riders found greatest need for them along their route. In this way all bad turns, blind roads, bridges and railroad approaches in a given territory would soon be marked for the benefit of touring motorcyclists. In time it will be the aim of the F. A. M. Touring Bureau to adopt a standard and distinctive sign for this work, but for the present clubs could follow any design calculated to attract the eye of a passing rider, the primary purpose being to impress upon him the knowledge that there is danger ahead, for the motorcyclist as well as the automobilist.

A LAUDABLE MOVEMENT.

DURING the last week in September more than 200 guide posts were placed along the roads leading out of Indianapolis. This was done by the Oakland Motor Company, through the efforts of its Indianapolis manager, George O. Wildhack, who is familiar with danger points near Indianapolis.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

SPRINGING DEVICE.

THIS arrangement can be fitted to any motorcycle. Rocker DAB is pivoted at A and this pivot is integral with the brace CA. A stiff coil-spring ED takes up all road jolts by allowing a restricted vertical motion of the rear wheel. From ED is also connected a strong, flexible steel cord, which, although idle when the spring is in proper condition, will prevent the rear tire and mudguard coming into contact should the spring break. To attach this device to any motorcycle, the rear mudguard and stand need to be altered, but the added comfort, it is claimed, should make it worth while. Contributed by Charles S. Price, Rutherford, N. J.

SPRING SUSPENSION.

UNDERSLUNG frame with semi-elliptic spring suspension is shown in the figure. The front fork FF is made extra heavy and bent as shown to attach the spring S to its

end and by a shackle H at the rear end. The front axle, FA, is attached to the center of the spring S. In the rear construction, the combined stays have a turned-up end and this and the shackle H carry the rear semi-elliptic rear spring SS. There are thus two springs to the front forks and two to the rear, causing easy riding. Contributed by Van Wharton, Fairbury, Ill. Wharton's idea, illustrated at the bottom of this page, is but one of many suggestions of this character, demonstrating that there is quite a demand for rear-sprung frames.

SPRUNG REAR FRAME.

TWO tubes, one on each side of the seat mast, run to the crank hanger and form a double triangle distinct from the main frame in this idea. At B is the crank-hanger which connects the triangle construction with the main frame. D is a leaf spring clamped at the bottom to the seat mast and the end attached to the top of the double triangular construc-

tion by a link. This arrangement gives a rear spring-frame. Contributed by Fred. Andregg, Hoxie, Kan., and illustrated above.

SPECIAL FUEL MIXTURE.

HAROLD R. SHOEMAKER, of Syracuse, N. Y., gives a lubricating pointer in the following letter:

Occasionally one hears a discussion with reference to using lubricating oil in the gasoline for the purpose of oiling the motor, and the idea is worthy of serious thought. A few engines are now being thus oiled, but the plan is of doubtful value when applied to the ordinary four-cycle motor, excessive carbonization sometimes occurring. I have, however, observed the results of a certain fuel mixture for over 400 miles of varying roads on a single-cylinder high-speed motor. This mixture is made up as follows: four tablespoonfuls of engine oil and two of kerosene to one gallon of gasoline. This should be mixed well and strained through chamois. The motor should also be oiled as before.

With this mixture the motor appears to run more quietly and smoothly and there seems to be a slight increase in power. Better cooling

VAN WHARTON.

is also effected. In my case, at least, the results obtained will warrant my continuing to use the special mixture.

SAFETY GRIP CONTROL.

TO avoid losing control of the machine when fitted with grip control, the following device is submitted. It enables the rider to limit the opening of the throttle from zero to any speed desired with the surety that it cannot be turned accidentally other than toward the closed position. A metal strip 3 has a projection 4 at one end, the whole being fastened to metal piece 2 on the twisting grip 1. Clamped between two discs but free to revolve between these discs 6 is a gear 7 with an arm 5 extending to one side. The whole is fastened to handle-bar 10. A small gear 16, mounted on shaft 17, with bearings 12, is connected to gear 7. This shaft has a milled head 9. A flat piece 13 on a square rod 15 slides up and down in a slot 18; this is under control of a screw piece 11. A spring 14 keeps 13 from coming into contact with 16. The contrivance is lowered by turning 11 to the right.

In operating the control, suppose the grip is turned to the right. Turn 9 to the left until 5 contacts with 4. Turn 11 to the right and 13 settles between two teeth on 16. This locks gear 7 so that the grip 1 cannot be turned to the left. This acts as a lock on the machine. Other methods of setting with the above can

readily be figured out. Contributed by David Kuskin (Bronx), New York City.

J. F. CUNNINGHAM and F. M. McClure, of Kansas City, Mo., have adopted the motorcycle for their work in the department of public welfare.

NEWS OF GLOBE-GIRDLERS

LATEST reports are to the effect that Mr. and Mrs. Humphries, who are attempting to circle the globe on a motorcycle, have left Vancouver for the eastern coast, but it is as yet undecided whether they will head for New York or some more northerly city. Thus far their road hardships have not been particularly severe, although they have traversed some of the worst roads in the Rockies. They have been forced to abandon the trailer used at the start of the trip, and all luggage is now carried on the machine. Mrs. Humphries uses a tandem seat.

HAPPENINGS IN NEWARK.

THE Bush & McDougall Company, of Newark, N. J., has been appointed Harley-Davidson agent for Essex county. It now handles the Harley, Thor and Henderson machines.

Paul Derkum, manager of the Newark Motordrome, was tendered a farewell dinner at the Kreuger Greisenheim, on Saturday evening, October 5, before he left for Los Angeles.

The third annual dance of the N. J. M. C. will be held at Oraton Hall, Newark, on December 4, and all nearby clubs in New Jersey and New York have been invited to attend.

Walter Goerke, local Indian chief, and Roy S. Pascall have formed an organization called the M. G. A. R., meaning Motorcyclists' Grand Army of the Republic. All riders who have been crippled so that they are permanently barred from racing are invited to join. No dues will be charged. Jake DeRosier has been elected an honorary member.

NEW COFFEYVILLE SHOP.

R. E. McCULLOUGH, Indian agent in Coffeyville, Kan., has just finished equipping an up-to-date repair shop which offers riders many of the advantages of garages in the larger cities. The shop has been selected as the meeting place for the Coffeyville M. C.

ABOUT thirty motorcyclists of Columbus, Ind., recently made a run to Nashville, Brown County, and were joined by riders from the neighboring towns en route.

ANTI-RACING ORDINANCE

Steps Have Been Taken to Hasten Adoption of Measure Prohibiting Motorcycle Contests in Newark.

NEWARK, N. J., Oct. 12.—An unsuccessful effort was made tonight to have a special meeting of the Common Council called for the purpose of hurrying action on the ordinance now pending to prohibit motorcycle racing here. This followed the death of Daniel Barnett, whose son William was killed at the Newark Motordrome on September 9 by Eddie Hasha's machine. It was argued that Mr. Barnett's death was hastened by grief over the death of his son, and the Vailsburg Improvement Association sought to use this claim to hasten action on the new anti-racing ordinance. When a petition for a special meeting was presented to Mayor Haussling he made the following statement:

"I have not the slightest doubt that the ordinance to prohibit motorcycle racing here will be adopted by the Council, and if it should not the Council will hear from me in a way that will not be pleasant. However, I do not see that we are likely to secure the adoption of the ordinance any earlier by calling a special meeting against the obvious wish of the body that must adopt it. My promise holds good to prevent any motorcycle racing until the Council has had an opportunity to act."

The ordinance has been taken up on second reading and will not come up for final passage until after the election for mayor, and it is assumed that nothing but politics can prevent the closing of the Newark bowl. It is pointed out, however, that if the ordinance is passed it will always be subject to recall.

NEWARK, Oct. 15.—It was announced today that Mayor Haussling has called a special meeting of Council for Friday evening, October 18, for the purpose of passing the anti-racing ordinance on its final reading.

A 69-MILE jaunt was recently enjoyed by 25 members of the Freeport (Ill.) Motorcycle Club, twelve of whom finished with perfect scores.

ENJOYED NEW ENGLAND TOUR.

CHARLES M. FARRELL, of Newark, N. J., and William Hirsh, of Elizabeth, N. J., two M. M. enthusiasts, have just returned from a two weeks' tour of the New England States. They report the roads in excellent condition. They stopped in all the principal cities and visited the M. M. factory at Brockton, Mass. Good roads were found in Massachusetts, excepting the Boston road, which was in bad shape and they advise tourists to go by way of Tarrytown, N. Y., to Danbury, Conn., and then through Connecticut.

ROUTE-MAPPERS BUSY.

CHARLES W. SCHMATT, of Cedar Rapids, Iowa, and Harry McNeer, of Jackson, Ohio, members of the Scarborough Company's road map force, have been doing considerable riding lately on their Harley-Davidsons. McNeer, who has traveled through Iowa, Tennessee, Missouri and Kansas, has covered 8,500 miles.

A STURDY PATHFINDER.

H. A. STEWART, pathfinder of the Scarborough Company of Indianapolis, Ind., on his cross-country trips for the purpose of mapping routes, uses Fisk motorcycle tires and states that he has obtained excellent service from them. The tire question is an important one with Stewart as he rides in all kinds of weather and does not always meet with good roads.

A NEW road has been built between Independence and Arkansas City, Kan.

Pathfinder H. A. Stewart.

QUESTIONS and ANSWERS

IF previous questions in this contest have been difficult to judge, those answers relating to Question No. 6 have been particularly so, and the awards which have been made had to be considered on the very finest points in each case. There were nearly a score of answers. Most of them covered the entire question, but others neglected to give proper methods for replacement and thus spoiled their author's chances for prize-winning. The first prize goes to B. A. Waltz, 1921 Ford Building, Detroit, Mich. The second is awarded to Livingston Fountain, 318 West Eighty-eighth street, New York, N. Y.

Below are printed Questions No. 7 and 8. Answers to No. 7 will be published in the October 31 issue, and those for No. 8 will be found in this department on November 14.

The decision in each case will be made by the Editor of this Department, and prizes will be awarded to the two readers whose replies are most satisfactory. Answers will be published the *second* issue following the number in which each question is asked. We cannot guarantee the publication of any answer received more than three weeks after the first publication of the question.

For a time the questions will be of a general nature, having to do with fundamentals. Later, however, problems of a specific nature will be considered. In this connection readers of MOTORCYCLE ILLUSTRATED are requested to suggest questions which they would like to have their fellow-riders answer.

All communications should be addressed to: "Editor Questions and Answers, MOTORCYCLE ILLUSTRATED, 51 Chambers street, New York."

Question No. 7. Explain the operation of the inlet and exhaust valves.

Question No. 8. Describe the action of a three-port, two-stroke motor.

FRANK

MERRITT

REMOVING AND REPLACING PISTON RINGS.

THE first prize in this contest was awarded to B. A. Waltz, of Detroit, Mich., whose answer was as follows:

"The best way to remove piston rings from a motorcycle piston makes use of the old tin-strip method in a slightly modified form. First clean the piston surface between the rings, and after seeing that the rings are loose in their respective slots, pry out an end of the top ring, or the one to be removed, and slip the small strip of brass behind it a short distance from the end.

"Follow this with a sheet of stiff paper, which is moved around the circumference of the piston to keep the ring from re-entering its slot, as the strip is moved around and forces the ring free. When the other end of the ring is reached and the strip of metal is removed, the ring is easily slipped off the piston over the paper sleeve.

"The replacing is more simple. Make a sleeve of the paper before used, wrapping it around the piston snugly. Slip the rings over this sleeve and the top of the piston to their respective slots. The power edge of the paper is to be located just above the slot into which the ring is to be inserted, so that the rings above are not in the way if they are already in place."

The answer given by Livingston Fountain was awarded the second prize. It is as follows:

"After removing cylinders secure four pieces

of spring steel about one-half an inch wide and one-sixteenth of an inch thick. Open the ends of a piston ring and insert one of the steels. Gradually work this around to a point nearly opposite the point of entry. In the same manner enter the other three pieces and move them around to points equi-distant from each other on the circumference of the piston. The ring may now be slipped off the cylinder with the fingers.

"To apply the rings again, secure a piece of soft iron about three-quarters of an inch in width and one-eighth of an inch thick. Cut in half and shape each half to 180 degrees of the circumference of the cylinder. Bend the four ends of these strips so that they are at right angles to the face of the cylinder. Drill a hole of say one-quarter inch diameter in the ends of each strip as near the bend as practical. Connect the two strips at both ends with bolts and nuts. Replace the rings by the reverse of the method of removing them. After the rings are in place, apply the clamp just made to the top ring, so that it holds the lower half of the ring and the upper half projects above the clamp. Tighten up on the two bolts and the clamp will compress the ring so that the cylinder will slide easily over the part that projects. Remove the clamp and proceed in like manner with each of the rings in succession."

Honorable Mention.

Honorable mention is given the answer of R. C. Newman, of Chicago. His answer was: "The best way to remove piston rings is to

first expand the ring, by forcing a thin narrow strip of steel between the diagonal lap where the ring is cut through, and twisting this strip. This will spread the ring at the lap. With one hand, keep the lap open and with the other insert a thin narrow metal strip between the ring and the piston. Insert four other strips, one after the other and work each around to the following positions; one opposite the lap, one on each side of the lap, two opposite each other and 90 degs. from each end of the lap. These strips run the length of the piston and project over the top of it. The ring will then be expanded so that it can be slid off over the top of the piston.

"To replace the rings, tie a piece of string tightly around the piston below the grooves and another above the grooves. Insert the same strips between the piston and strings and in about the same position as when removing. Allow the strips to project above the piston head. Slip the ring over the strips and slide it down same with the lap in the same position relative to the strips as when removing it. The ring can then be slid over its proper groove and held there with one hand while the strips are removed with the other. The ring will then spring into its groove. The strings are cut away, after all the rings have been replaced."

Another answer worthy of honorable mention is that of Van Wharton, of Fairbury, Ill.

"Piston rings may be removed with the piston in position on the connecting rod or they

may be removed when the piston is free from the connecting rod. To remove the rings secure four or five strips of some thin metal, as tin, about 2 inches long and $\frac{3}{8}$ inch wide. At a point opposite the opening in the top ring, press the ring into its groove as far as possible so that the opening of the ring will protrude beyond the piston. At the opening of the ring insert the strips of tin, and work them around the piston until they are at an even distance apart. Then the ring can easily be removed by slipping it over the strips of tin. The second and third rings may be operated on in the same manner, only one must be careful to move the ring all at once, so that it will be square with the piston; not one side and then the other, for in this way the rings are twisted and have a good chance to break.

"In replacing the rings use the same strips of tin and replace the last ring first. It is best to return the same rings to their former grooves. Place the strips of tin around the piston so that each trip will cover all three grooves. Then bend the strips over at the top of the piston so as to hold them in position. The ring can then be slipped over the strips without interference of the first two grooves; when the ring is squarely over its groove, begin working the strips around to the opening in the ring and take them out. This allows the ring to fall into its groove. Replace the last two rings in the same way, being careful to move the rings square to the piston so as not to break them. When all three rings are replaced, adjust the ring in such a way that the openings of no two rings will be opposite."

TOUR FROM WILLIAMSPORT, PA.

F. E. DENTLER.—Motorcycles need no license in New York State, so you can ride on your Pennsylvania license without trouble for any length of time. From Elmira go to Watkins Glen via Horseheads, Pine Valley, Millport, Montour Falls, and Watkins; 23.2 miles, over fair-to-good dirt roads. From Watkins Glen go to Geneva via Hector, Lodi, Ovid, Willard, Dey's Landing. Distance, 41.8 miles over similar roads. From Geneva, follow back over Touring Number Route 48 to Syracuse, beginning at 54.1 Geneva. From Syracuse go to Fayetteville, then to Mycena, and Sullivan to Canastota, about 25 miles.

From Canastota go to Oneida Castle, then to Vernon, Kirkland, New Hartford and Utica, about 25 miles over macadam roads. From Utica take latter part of route No. 28 (beginning at 95.6 Utica) to Albany, 108.2 miles. From Albany take route No. 25 to Pittsfield, Mass., 37 miles. From Pittsfield follow back over route No. 10 to Springfield. From Springfield take route No. 15 reversed to New Haven, Conn. Then follow back over route No. 39 from New Haven to New York City. From New York City take route No. 35 to Delaware Water Gap, then go to Wilkesbarre via Stroudsburg, Bartonsville, Swiftwater, Pocono Summit R. R. Station, Naomi Pines R. R. Station, Blakeslee, Glen Summit, Fairview, Ashley, and into Wilkesbarre, 63.6 miles over varying roads. From Wilkesbarre go to Williamsport via Nanticoke, Shickshinny, Berwick, Bloomsburg, Pine Summit and Muncy, 83.4 miles over fair-to-good mountain roads. From Geneva to Buffalo follow route No. 47. Follow back to Geneva over same route, then go on to Watkins Glen and Elmira. From Elmira go to Williamsport via Southport (N. Y.), Columbia Crossroads, Troy, Canton, Ralston. Maps of New York and Mas-

sachusetts obtainable from the American Automobile Association, 437 Fifth avenue, New York City. You are exempt for 10 days as a non-resident rider in Massachusetts.

HORSEPOWER DEVELOPED.

PHILIP L. ALLISON.—In calculating the horsepower developed by a gasoline four-stroke motor, the following formula is used:

$$H. P. = B^3 L n \times N \text{ where } B = \text{bore in inches; } L = \text{length of stroke in inches; } n = \text{number of revolutions per minute, and } N = \text{the number of cylinders.}$$

For a single cylinder $2\frac{1}{2}$ by 3 inch motor, at 1,400 revolutions per minute, the power will be $(2\frac{1}{2} \times 2\frac{1}{2}) \times 3 \times 1,400 \div 16,000$. This will be equal to 1.64 horsepower. At 2,000 revolutions it will be 2.34 horsepower. At 2,750 revolutions the horsepower will be 3.22. For a twin motor, multiply by 2, or put $N = 2$. You can get the power at any intermediate speeds by putting the revolutions desired in place of n in the above formula.

A four-cylinder motor is perfectly safe to use, and has the advantages of more even and quiet running than most twin motors.

DELIVERY WAGONS.

CHAS. F. HOPINS, JR.—For motorcycle delivery cars write the Minneapolis Motorcycle Co., 517 South 7th street, Minneapolis, Minn.; New Era Autocycle Co., 22 Dale avenue, Dayton, Ohio; Triumph Mfg. Co., 51 East Woodbridge street, Detroit, Mich.; Hendee Mfg. Co., Springfield, Mass., and the Reading-Standard Co., 306 Water street, Reading, Pa.

VARIABLE GEAR AND SIDECAR.

FREDERICK ZEPP.—1—About the only position for a two-speed gear for your machine is in the rear hub, but we cannot advise your fitting one there. The manufacturers of your make of mount will not bring out a two-speed gear in 1913, and have none on the market. Nor will another make fit the drive as at present constructed. Get a 45-tooth rear sprocket; it will improve matters surprisingly in side-car work.

2—The new (1913) clutch will have cork inserts and be metal-to-metal. Write the factory for one after November 1, and in the meantime reface yours with Thermoid, Raybestos or some like fabric. Tighten the clutch spring a trifle. *Don't drive on the clutch*; let it be in or out. A fabric-lining can be put on by any good garageman in a short time, so there is no necessity for two weeks' waiting.

3—The side-car attachment is improperly coupled to the machine. Too much stress is put on the rear fork, hence its "set" to the left. Shift the attachment forward or backward until you can ride "hands off," and keep the front of the side-car frame level or even inclined upward. It it sags downward, the motorcycle frame will be distorted or broken in course of time. Did you attach the car strictly according to directions given? Keep the rear wheel of the machine and that of the side-car vertical at all times, plumbing them when on a level surface.

WALTER EVANS and Roscoe Harkness, of Terre Haute, Ind., have completed a 1,000-mile jaunt through Indiana, Illinois, Wisconsin, Michigan and Ohio on their motorcycles.

ALLIANCE OF THE F. A. M AND C. M. A.

American and Canadian Motorcycle Associations Aim to Co-Operate On Racing and Other Regulations For Mutual Benefit

WITH a view of bringing about a mutually satisfactory understanding between the F. A. M. and the Canadian Motorcyclists' Association, officials of the two bodies recently entered into an agreement relative to the interpretation of competition rulings and general regulations. It has been the desire to standardize racing rules as far as possible, so that there need be no conflict between American and Canadian riders, and this desirable condition is provided for in the abovementioned agreement, which also refers to an exchange of touring courtesies. The agreement, which became effective on October 15, will remain in force for a period of two years. It is signed by President K. R. Spencer, for the Canadian association, and Chairman J. Leo Sauer, of the F. A. M. National Legal Action Committee, and deals with the situation as follows:

"This agreement, between the Federation of American Motorcyclists, represented with full authority by J. Leo Sauer, Chairman of the Legal Action Committee, and the Canadian Motorcyclists' Association, through its President, K. R. Spencer, witnesseth:

"It is understood and agreed by the parties to this agreement that, in order to establish and promote relations of mutual benefit, the following understanding shall be in force beginning October 15, 1912, and terminate two

years from that date, unless this agreement is terminated before that time, as may be done by either party upon sixty days' notice:

"1st. That all F. A. M. racing records, competition rulings and regulations, affecting members of the F. A. M., shall be acknowledged in Canada and that, in turn, all C. M. A. records, competition regulations and rulings, affecting the members of the latter organization, shall be acknowledged in the United States.

"2nd. That, in order to avoid confusion, it is to be the endeavor of both parties to maintain, as far as possible, similar rules for competition.

"3rd. That all touring and other F. A. M. privileges be granted to Canadian riders when in the United States, the C. M. A. to do likewise for F. A. M. members when traveling in Canada.

"4th. That the Canadian Motorcyclists' Association agrees not to accept anything other than a temporary fifteen days' membership from any American rider or club, without the consent of the Chairman of the F. A. M. National Membership Committee; the same to apply to Canadian individuals or clubs who may seek membership in the F. A. M.

"5th. That this agreement be in force for a period of two years, or until terminated by either party on sixty days' notice."

MANY a hotel keeper and restaurant proprietor along the main touring routes, particularly in the Eastern States, might profit by consideration of the fabled goose and its golden eggs. In some districts the bonifaces are reaping a pretty penny from motorcyclists, and not content with this they are prone to send their prices up still another notch when a khaki-clad roadster seeks shelter or refreshments. This is poor policy plus. The rider may pay the inflated price, but he does it in the full knowledge that he is being buncoed, and he will pass a word of warning along to his brothers of the single-tracker. The American motorcycle army is yearly recruiting thousands of riders who must eat, drink and sleep while on tours, and there are honest dollars aplenty to be derived from reasonable consideration of the rider's physical needs.

IN other words, the motorcycle goose will lay its golden eggs regularly and cheerfully for the hotel men, provided they do not sacrifice the well-meaning fowl with a view of obtaining all the eggs at once—after the manner of the wooden-pated chap who figures in the fable. The motorcycle field has developed beyond the point where any caterer for public patronage can afford to slight it, and the hotel keeper who attempts to combine high prices and poor service whenever a khaki suit appears on the premises is taking long chances with a source of revenue that is growing in importance daily. One more point: After the hotel men have allowed the egg lesson to sink in they might pass their conclusions along to the owners of automobile garages who are also inclined toward flighty prices where motorcyclists are concerned.

SIDECARS are becoming quite common nowadays, but it would seem that the fitting of the car to the cycle is not always properly done, as the wear on sidecar tires show. The wrinkle is to line up the car and cycle so that when resting on a level piece, both wheels will be plumb-line vertical. Try this out, using a pipe bowl, a wrench or anything fairly heavy on a piece of string, and adjust the fittings to suit. So much for the vertical lining-up. Now get a passenger and ride off; on a straight stretch let go of the bars and see in what direction the outfit tends to turn. If to the right, move the car forward; if to the left, move the car rearward. The position which is easiest on rider and passenger alike, not to mention the motorcycle, is when the outfit will go straight ahead with the hands off the handlebars.

THE proper position for the passenger is leaning slightly backward, with the front of the sidecar horizontal or inclined slightly

upward. This takes a good part of the load off the motorcycle and puts it on the sidecar where it belongs. If the front is allowed to droop forward, the motorcycle takes the most of the load and the frame is strained. The strain on the fittings is increased and in case of a shock they may part suddenly. Such an accident happened recently in my neighborhood, the passenger being hurled out as the front fitting gave way, and landing in a bed of cinders with much loss of skin and temper. The weakening of the front fitting was due to a collision which happened shortly before the accident, but the indirect cause was the strain produced by the drooping position of the sidecar.

SPEAKING of sidecars, in addition to their passenger and package-carrying functions, they have several other uses worthy of mention. One is for demonstrating the pulling power of the motorcycle with the prospective customer comfortable in the "sidie" and the

salesman right at his ear with a persuasive line of argument. A second lies in teaching beginners the operation of the motorcycle, how to get that 200-degree turn of the wrist to drop the valve and advance the ignition in a fifth of a second, for instance. In any case, the instructor is right where he can bring the outfit to a stop in emergencies, from the seat of the sidecar.

But there is still another use. This is for people who want to enjoy motorcycling and yet can't ride solo mounts. By these I don't mean the unfortunate novice who doesn't seem to be able to do anything in the riding line, even when assisted, and is literally afraid of the machine, but the man that isn't quite "as young as he used to be," for example. There are numbers of these possible riders in the country, but the powerful twin two-wheeler is physically beyond them. When they fit a sidecar the story should be different.

THE purchase of a second-hand motorcycle, except from a reliable dealer, is like buying a horse at a county fair; only, in the case of the two-wheeled "bargain" it usually takes some little time for the possessor to realize that he has not got exactly what he set out to get. I know of a number of cases where the purchaser of second-hand mounts figured on getting about \$150 worth for \$100 from brokers in that line of trade, and after getting more like \$90 worth, they raised loud outcries. If the purchaser of a "crock" can prove the bus was sold to him under false pretenses, a threat of action in court will generally serve to bring the flim-flammer around to some compromise or to refunding the money. There are very few genuine crooks in the motorcycle trade today; the rare "bargains" referred to are usually the result of going to someone who does such business on the side, or acts as a broker for somebody else.

All in all, the man who expects to get \$1.50 value for \$1 is going to get left badly. There are cases where a machine in good serviceable condition is sold for a song by reason of being of an extinct model or slightly out of date, but they are comparatively rare as compared with the "crocks." If you don't mind the appearance of your mount you can get first-class singles from two to three years old at very fair prices; but you may have difficulty in getting repair parts when they are needed. Such mounts can only be found at the shops of agents of other makes, except of course in rare cases, as they have been taken in part exchange. These are the real bargains of the motorcycle trade, and their purchasers do not cry out because they didn't get something for nothing. In and near the Motorcycle Rows of the larger cities you can see these veterans running well on the streets, and the suburban roads are traversed on week-ends by them and their riders. It is needless to say that the latter are not embryo speed merchants, as the mounts can only be pushed to a fair turn of speed. But they get pleasures that the riders of the smart 1912 machines miss, perhaps, in getting the best work out of their aged mounts. Incidentally, I have obtained a number of corking good wrinkles from riders of this class, but I cannot say the same thing about the "latest model" rider as a class, that is, the city edition.

HERE followeth a pessimistic croak. In my travels in and out of the motorcycle districts of various cities I find what appears to be a widespread notion that a dealer makes "good money" by every transaction. This is on a par with the popular idea that automobile manufacturers are all millionaires, and while it may give the dealers in general good repu-

titions for credit, etc., it gives rise to attempts at grafting under the name of "discounts." I believe the clothing houses and cut-rate druggists were the originators of the slogan "retail goods at wholesale prices," but plumbers, hardwaremen, butchers and even bakers think they are entitled to discounts on motorcycle goods and are indignant when they are refused. Here is the usual way the general tradesman endeavors to get his discount out of the "wealthy" motorcycle dealer:

He goes to some paper-hanger, perhaps, who deals in motorcycle supplies on the side and gets a figure from him; then goes to another "dabbler" of the same kidney and gets (usually) a lower figure. Finally, he approaches the regular dealer and prices the article desired. The answer of the grafter to the price quoted is: "Well, I got the figures from — and —, but I came to you, and you ought to give me a special discount." Most times he gets left, but on other occasions he doesn't, and ever after that he uses the figure at which the soft-hearted dealer let him have the goods to cut down every other dealer, all to save a few cents. Even the greenhorn riders in the big cities have the habit and will argue for an hour on the subject. All this is because the dealer is supposed to sit up nights passing his gold from hand to hand and using a reckoning machine to count it.

THE dealer is actually no Cræsus, at least not as far as accessories sales are concerned. Take a well-known accessory, for example. You pay \$5 for it; it costs the factory \$2.10 to make it and another 76 cents to sell it; the jobber has to get his 50 cents profit on it and it takes nearly 60 cents' worth of the repairman's time to put it on. That time is figured on the repairman's weekly wage and not on the hour charge. The dealer pays \$3.60 for it, leaving him 80 cents profit, which

pays his man nearly three hours' salary, and figures out at 19 per cent. gross profit. He puts on one of these a week, say, and "gets rich." Now if he allows ten per cent. discount, he will actually lose 20 cents unless he charges for putting on the accessory; but the makers say "\$5, applied," so a charge for fitting is out of the question. There are lots of little parts that the dealer makes one or two cents on each, and with a discount he stands to get only a fraction of the little copper coin, if any part at all.

If you sit down and figure it out, the dealer must make most of his money on repairs and side-jobs, like baby-carriage work, bicycle repairs or electric wiring; and at that, the most they can figure on is a reasonable sum for the time when they must retire.

RED REFLEX MIRRORS.

FOR ten years past British riders have been agitating for a Universal Lights Bill, and the movement has continually been blocked by firms interested in the road conveyance of inflammable freights. The technical difficulties were solved by the invention of the Lea-Francis red reflex mirror, a small circular lens mounted on the base of a ruby reflector, which could be clipped to the rear-stays or carrier of a cycle, and would reflect the long distance rays of a big acetylene headlight at 200 yards distance. This was thought to have greased the passage of a universal lights bill into law, but the legislature was so lumbered up with social bills that the lights act could not get through. However, the county authorities have taken the matter up, and local bylaws will compel all wheeled traffic to carry either a red mirror or a red tail-lamp next year throughout many districts. It is characteristic of English ways that at present the motorcar—the only vehicle which is never overtaken—is the only vehicle compelled by national law to carry a tail lamp—a tail lamp, being, of course, a device to safeguard overtaking in the dark.

BRITISHER.

AN ADDITIONAL BRACE.

SEVERAL accidents of late, due to sidecar breakage, in London, England, have moved British designers to seek a more substantial method of bracing the front section of the passenger attachment. One of the suggestions, embodied in the accompanying illustration, provides for an upright arm to be fastened to the front of the car. It is reproduced from a recent issue of *The Motor Cycle*, of London. While there does not appear to be a demand for such additional bracing of sidecars in this country as yet, the idea is worthy of consideration, in view of the fact that it has developed from years of passenger-carrying experience on the other side.

illustration, provides for an upright arm to be fastened to the front of the car. It is reproduced from a recent issue of *The Motor Cycle*, of London. While there does not appear to be a demand for such additional bracing of sidecars in this country as yet, the idea is worthy of consideration, in view of the fact that it has developed from years of passenger-carrying experience on the other side.

DELAWARE JUSTICE?

THAT reasonless antagonism to the motorcycle has not yet been eliminated from court proceedings in every State is evident from a letter forwarded by Hugh M. Smyth, of Wilmington, Del., who was recently separated from \$19.85 under conditions calculated to rouse the ire of any motorcyclist. While running through a Wilmington street at 10 miles an hour (figured on a standard speedometer), Smyth saw a pedestrian step out suddenly in front of his machine. He sounded his horn, shut off power and applied his brakes, coming to a stop just as his front wheel bumped the pedestrian's legs. The latter, who had become greatly excited, used some hard language and condemned all motorcyclists to perdition. Then he took the rider's number and swore out a warrant for his arrest.

When Smyth appeared in court the complainant testified that he was unhurt, that the motorcyclist took every precaution to avoid the "accident" and that he was not even knocked off his feet. Still he argued that the rider was making 15 miles an hour, and the judge, after declaring that too much speeding was being done, fixed a fine of \$15 and costs, amounting in all to \$19.85. If convicted on the charge, and Smyth can't see where he was convicted, the fine could have been placed anywhere from one dollar to \$20, but the motorcyclist was given almost the maximum fine despite the fact that he had never before faced a speeding charge.

IN Oregon more than 8,000 motorcycles and automobiles have been registered this year; a gain of 2,000 over 1911.

A VACUUM TIRE.

FROM a Brooklyn (N. Y.) inventor comes the idea embodied in the accompanying diagram of a vacuum tire, which he claims will do away with the puncture bugaboo. The Brooklynite has evolved what he calls a single-tube, wrapped-tread, vacuum tire, the innovation being that the air is pumped out of the interior instead of being compressed into it. The vacuum chamber may vary in size according to the weight that is to be placed upon the tire, and when the weight is applied the chamber tends to widen in the middle, and this

tendency is resisted by the pressure of the atmosphere exerted on the outside of the tire. In this way, argues the inventor, the tire depends upon air for its resiliency, but as the pressure comes from the outside, blow-outs are impossible. Punctures may be sustained, but owing to the construction of the tire it may be used to advantage, as a cushion tread, after being pierced. It is not known how the tire has stood up under tests, but the idea is worthy of consideration.

YOUNG CLEVELAND THIEVES.

WITH the co-operation of local detectives, the police authorities have succeeded in locating a gang of Cleveland motorcycle thieves who have stolen many machines of late. They are all youths with the motorcycle fever and, being without means of purchasing a mount they yield to temptation when an opportunity presents itself for making away with one.

KANSAS CITY MOUNT STOLEN.

C. HANSON, of Kansas City, Mo., mourns the loss of an Indian 7 which was stolen recently. The machine was a single-speeder, No 75-D 912, and a dent in the right side of the tank may help to identify it. Hanson offers a reward for information leading to the recovery of the mount. Communications may be addressed to him at 1406 Grand avenue, Kansas City.

THAYER BAILEY, of Muskogee, Oklahoma, is making a motorcycle trip to Ottawa, Can., and return, a distance of 2,000 miles.

AN ordinance requiring all motorcyclists to carry license numbers costing \$2 per year recently became effective in Marion, Ohio.

Rumor has it that Ray Seymour may be sent to Japan on a special racing expedition.

The SUCCESSFUL DELIVERY VAN

ITS CONSTRUCTION AND OPERATION

D. R. HOBART

PART II.
Further Operating Details
—Lay-Out of Office, Garage and Shop—
Making Repairs—Spare Parts.

HAVING made the survey and chosen the type of vehicle best suited for the service, the next points to be settled concern the station and the *personnel*, or staff. Supposing that the survey shows three cars will be needed at the start, there should be a fourth as a reserve car, and on this basis the station is to be fitted up. The departments in this station will be the office, package room, garage and shop.

The office, which should be located at the front of the station—or on the second floor front if there are two stories to the building—will be fitted with two desks, one for the manager and the other for a clerk and bookkeeper. In addition there should be the necessary files and a map on the wall showing the different districts as in Part I of this article. Adjoining this office is the package room, actually the most important department of the system and one that will tend to accelerate deliveries as the business grows, if properly organized. For our three-car business, the package room will merely have a sorting table and three small wagon tables. The latter hold the loads for each of the three cars and may be in the form of trucks, so that after loading they may be wheeled out of the room to the garage and the cars loaded direct. The package room should have strong doors and should be under the direct charge of the clerk or manager.

The Garage and Shop.

In the garage, which is in communication with the office either directly or indirectly, and with the package room by a single door wide enough for passing the tables through, there will be ample space for the four cars, the emergency or spare car being at the rear of the others. There should be a washing device, and lockers for the drivers, as well as the usual toilet room. The floor should be concrete with a slope toward the washstand or a drain opening at the center, for example. Directly communicating with the garage is the shop with which is incorporated a store-room. The equipment of the shop will de-

pend, of course, upon the type of car used.

For a motorcycle with sidecar or tricar attachment the following machine tools will be found invaluable (this is with the supposition that all repairs except brazing and welding are to be made by the station force): A small drill press with hand or power feed, an arbor press, an emery wheel and a vise or jig to fit on the table of the drill press. In hand tools, taper and straight taps and reamers, drills, chisels, a soldering outfit, monkey and Stillson wrenches, and one or two large "claw" wrenches, files and screwdrivers are to be supplied. The small tools should each have a place in a wall cabinet and the machine tools must be arranged to best allow of work on them and passage between them. A ground plan of a station is shown in the first figure.

In this figure A is the office and B the package room. A four-car (three in service and one spare) equipment is indicated, with room for expansion, of course. The shop is at D and the garage at C. E is the store room, an annex to D. At *a* is the sorting table and *b, b, b* are the loading or wagon tables; *c* is the spare car, *d* the washing device, *e* the bench, *f* the drill press and *g* the arbor press. The emery wheel is shown at *h* and the tool cabinet at *j*. A stand for a spare body is located at *k*. The plan is one arranged for a station on a 25 x 75-foot city lot, with windows at front and rear only. The front door of the station slides, while that to the office is on hinges. The door between the shop and

garage slides also and should be fireproof.

The Organization.

The diagram will give an idea of the organization of the *personnel* of such a station. At the head is the manager, who solicits business and oversees the entire staff. The clerk acts as bookkeeper and takes in all packages sent to the station, examines the route-cards, etc. He also supervises the drivers and employees in the absence of the manager. The station (garage and shop) is in charge of the shopman, who is a working-foreman—making repairs. He has for a helper a boy who washes down, does tire work, sweeps up, etc. The drivers (three in number) take care of their cars and assist in any repairs thereto, sort the packages and load them, etc. The store-room is in charge of the shop-man.

A schedule having been arranged for the day's runs, the driver starts out and calls at the various business houses on his route for packages to deliver. On arriving at each house he checks up the packages obtained, sorts them, signs the house's book and proceeds with the delivery. He returns to the station when all packages have been delivered. After the day's work is finished the driver removes any undelivered packages to the sorting table, crosses them off his list and turns the way-bill over to the clerk. He then looks over his car and assists in any necessary repairs.

As the business expands, it will be necessary to send out a car for collecting the packages in addition to the regular calls made. Such packages are brought in and unloaded on the sorting table. The clerk sorts them, placing them on the loading tables according to the routes taken by various cars. When each car returns, its loading table is wheeled to it. Packages are placed, of course, so that those farthest from the station will be in the back of the body, while those to be delivered nearest the station will be close to the door of the van.

The spare car is driven by the shop-man to the scene of any breakdown and the load

transferred to it from the disabled car. The regular driver then takes the spare car and continues deliveries, while the shop-man gets the disabled vehicle back to the station. It is there repaired and tested out, the spare car in the meantime performing regular duty. When satisfactory, it is again placed in service and the spare car resumes its place in the garage as before. The reason for this is one of economy: a driver knows his regular car best and is inclined to keep it in better condition than one which may be driven by him today and by somebody else tomorrow. This has been found to be the means of saving hundreds of dollars per year for taxicab companies.

For comparison with the modest four-car organization one of ten cars (eight regular and two spare) is here given. The manager is now assisted by a subordinate, who solicits business; there is an extra helper for washing, etc., and a handy-man, who can drive, make repairs, etc. Eight drivers form the delivery force.

In such a system, one or two cars will be employed regularly in collecting and the remainder in delivering. One of the spare cars

will be fitted as a "breakdown" car, with appliances to make almost any repair on the street and to tow disabled cars, while the other is merely a spare car with box body. The shop-man is driver of the "breakdown" car and the handy-man of the second spare car, when the shop-man is out. Drivers sort packages, assisting the clerk, and there should be six loading tables.

The Supply of Spare Parts.

There should be enough spare parts in stock to take care of every trouble on 80 per cent. of the cars, and at least one complete spare motor and variable gear. These are kept in the storeroom and given out by the shop-man, who keeps account of them in a book under the head of each car. From the total of repairs, overhead expenses, salaries, etc., the costs are figured, and the gain at the end of any period is readily ascertained.

Where the service is such that the tires used per year will be sufficient to warrant a special contract with a tire company, such a contract by mileage per tire should be made. This is if the tubes are not "filled" as mentioned in Part I. In this event, "second" casings can be bought to advantage instead of new ones, provided the streets are not too rough and the surfaces of smooth sections are more or less continuous. It is in cities where the streets vary in paving that the configuration mentioned in the former section of this article affects the expense account adversely.

(To be concluded.)

GEORGE and Charles Berger, of Menominee, recently rode from Menominee to Milwaukee to attend the Vanderbilt cup races.

GASOLINE AVERAGES.

It is reported that the gasoline used on the recent Short Grass tour averaged 75 miles per gallon for the singles and 65 miles for the twins.

ONE of the first questions asked by the experienced rider is: "What is the horsepower of the machine?" while the novice is usually content with ascertaining how fast it will go, forgetting that speed is deceptive. Although difficult to measure, the rating of horsepower is of great importance, both as a means of comparison between different machines and for the benefit of the rider and repairman, as it is impossible to adjust a motor to the best advantage if one has to do any guessing.

An easy method of determining the horsepower the motor *should* develop is used by automobilists and is expressed by the

D^2N
formula — This assumes a piston speed of 2.5

1000 feet per minute, which is standard practice, as a short-stroke motor will make more revolutions per minute than a long-stroke motor of the same bore, thus keeping the piston speeds about equal.* In this formula D is the diameter of the cylinder, N the number of cylinders and 2.5 is an arbitrary constant, adopted from extended experience with many types and sizes of motor car engines.

The Cubic Displacement Method.

Another fairly good way to rate horsepower is by the cubic displacement method used in classifying motorcycle engines in racing. This method assumes that 7.5 cubic inches of piston displacement will be about equal to one horsepower. Thus 30.50 cubic inches will give about 4 horsepower and 61.00 cubic inches will give in the neighborhood of 8 horsepower. Thus the ratio between bore and stroke may be varied within wide limits while still keeping to the respective classes.

It is evident that both the above methods take it for granted that two motors of the same size will develop the same horsepower. Of course, some assumption of this nature is necessary when classifying machines for racing and endurance contests, but it may be far from the actual truth, as there are so many contributing factors. For instance, there is the compression; the size, lift and timing of the valves; the ignition, the adjustment of the

(* The writer apparently forgets the motors in the foreign racing machines in this connection. The 1910 de Dion 4-inch bore and 10-inch stroke single-cylinder motor has a normal piston speed of 3,000 feet per minute. The Lion-Peugeot voiturette motors, with a bore-stroke ratio of 1:2 have about 2,800 feet per minute piston speed. This shows the limited value of the S. A. E. and Royal Automobile Club formulae: $\frac{D^2N}{2.5}$.—Eds.)

carbureter, etc. All these may vary the power between quite elastic limits.

Figuring by Brake Test.

Furthermore, it does not necessarily follow that the motor giving the greatest maximum horsepower is best for road service, in view of the fact that racing motors, developing maximum power at high speeds, are exceedingly difficult to handle under ordinary riding conditions. After all is said, one of the best methods of measuring horsepower is by a brake test, but as brake horsepower is the product of two factors—speed and pull—some provision must be made for measuring them simultaneously. The speed or revolutions per minute should be measured by a tachometer, but this is a rather expensive instrument, and good results may be obtained from a revolution counter, costing \$1.50, and an ordinary watch.

One Reliable System.

When it comes to determining the actual horsepower delivered through the rear wheel to the road surface there is no system of measuring more satisfactory than one which involves a little traveling carriage and the aforementioned spring balance. The carriage is fitted with wheels which bring it against the under side of the tire when the machine is on the stand. The spring balance is fastened at a point forward, and the rear wheel of the machine is placed so that it rests on the carriage. Then when the motor is started the carriage will be driven backward proportionately with the power exerted through the wheel, and the actual drive in pounds is ascertained. Then by calculating the distance the periphery of the wheel travels, and multiplying it by the pull in pounds, and dividing by 33,000, the horsepower will be reliably determined.

DEMONSTRATING VANS.

MINNEAPOLIS, Minn.—The Minneapolis Motorcycle Company has just commenced an aggressive campaign to acquaint local merchants with the great value of the light delivery/tricar which it has been manufacturing for about two years. These cars have become quite popular throughout the country, but little or no effort has been made to promote local sales, owing to the fact that the manufacturers have been pushed to their utmost to produce machines for out-of-town dealers. Amongst the local firms now using these cars are the Minneapolis Dry Goods Co., Frank Greaves & Co., The New England Furniture Co. and The Motor Despatch Co. There is an additional car to be placed in the service of The Motor Despatch Co., also one finished in special colors to be delivered to Whitted's Flower Stores. Machines are now under way for Witt's Meat Market and Waldron, the dry cleaner.

The Minneapolis Motorcycle Co. is proving the efficiency of their cars by furnishing prospective purchasers with free delivery service for a limited period, and there is a big demand for demonstrations.

A THREE-DAYS' TOUR.

A THREE days' motorcycle trip is now being planned by the motorcycle club of Coffeyville, Kans. Invitations will be sent to all Kansas clubs. The club will divide and have two captains. The side finishing with the best score will be the guests of the losers at a banquet.

FOR FRISCO POLICE.

IN the photograph below appear ten Harley-Davidson machines which were recently purchased for the San Francisco police department from Joseph Holle, the local agent for H-D motorcycles. When the machines arrived Holle had them carted through the principal streets on a huge dray which carried suitable signs, and later they were placed on display for a time in his spacious salesroom. These machines are now being used by the police with excellent results.

**A FORMIDABLE TRIO.**

NOT long ago former F. A. M. President Hamilton, of the Federal Tire Company; W. J. Ash, of the Chicago Cycle & Supply Company, and W. J. Surre, of the Continental Rubber Works, met while in the West on business and the accompanying photograph shows them at Shasta Springs, Cal. That tire interests in general were well cared for on the coast with this genial trio on the trail goes without saying.

Ash, formerly connected with the Hine-Watt Company, recently completed a Western trip for the Chicago Cycle Company, and reports having done \$12,000 worth of business. He is now covering Eastern territory.

MOTORCYCLES AT FAIR.

LANCASTER, Ohio.—L. P. Birkenbach, who has the agency for the Thor in central Ohio, and who operates a branch house in Lancaster, had an exhibit of three machines at the Fairfield County fair last week. This is one of the largest county fairs in the State.

BREMER-WILSON COMPANY.

FRED G. BREMER, formerly manager of the Twitchell Gauge Co., and I. N. Wilson, president of the Fowler-Carnes Co., of Aurora, Ill., have formed the Bremer-Wilson Co., with offices at 1256 Michigan avenue, Chicago, to manufacture and market the Triplex gas saver and other automobile and motorcycle accessories.

Mr. Bremer is an automobile engineer of wide experience. His first connection was with the Bremer Machine and Tool Co., of Kalamazoo, Mich. He later spent some time with the Pope Mfg. Co., The American Mercedes Co., The Midland Motor Co., The United States Motor Co. and The Twitchell Gauge Co.

The Triplex, which is to be featured by the new company, is a device placed between the manifold and the carburetor to break up the mixture and thus afford greater fuel efficiency and minimum trouble from carbonization. It is claimed that by utilizing every drop of gasoline to its full capacity the Triplex effects a saving of 25 per cent. on fuel and also gives increased power. The Triplex prevents back-firing and assists in easy starting. The device may be attached by any rider in half an hour.

ANGSTEN-KOCH EXPANSION.

IN order to keep abreast of its rapidly growing business, the Angsten-Koch Company, of Chicago, manufacturers of the well-known Simplex tandem attachment, has added another floor to its factory and will produce about twelve new motorcycle accessories in addition to the tandem for the 1913 season. New machinery will be installed on such a liberal basis that besides turning out its own specialties the company will be prepared to manufacture accessories on outside orders. The company, which is to be represented at the Chicago Show, will make its 1913 announcement at an early date.

M. S. McNABNEY, manager of the Kansas Wholesale Grocery Company, of Coffeyville, Kans., has purchased a motorcycle to use for hurry-up trips around the city and for country trade calls. McNabney also owns an automobile, but prefers the motorcycle.

Headquarters of Joseph Holle, San Francisco, Agent for the Harley-Davidson. The Ten Machines in the Foreground Were Recently Purchased for the San Francisco Police Department, and Are Now in Service.

Members of M. M. A. at Recent Meeting in the New Southern Hotel, Chicago. President A. B. Coffman, 1; Kelly R. Jacoby, 2; F. W. Starr, 3; L. J. Carling, 4; Ignatz Schwinn, 5; F. J. Weschler, 6; William G. Schack, 7; R. W. Gould, 8; Benjamin Howard, 9; Guy M. Greene, 10; E. E. Hinman, 11; Robert Hinds, 12; Arthur Davidson, 13; E. J. Knight, 14; T. W. Henderson, 15; H. M. Kirk, 16.

MANUFACTURERS DISCUSS SHOW PLANS

At Lively M. M. A. Session in Chicago Reports Are Heard on Both New York and Windy City Exhibitions—Schwinn is Host at Luncheon

AT the busiest meeting held this season the Motorcycle Manufacturers' Association, holding forth at the New Southern Hotel in Chicago, on October 9, took up a number of important plans, mainly concerning the annual shows. The show committee announced that it has obtained 6,000 square feet of space to be set aside as the motorcycle section in the Grand Central Palace, where the New York Show will be held. This section is at the south end of the balcony, on the Forty-third street side. Applications have already been filed for most of the space and it is evident that manufacturers of both motorcycles and accessories are looking forward to an unusually imposing display.

Manager J. S. Vogel, who is in charge of the independent Chicago Motorcycle Show, was present at the meeting and his plans as outlined for the benefit of the manufacturers met with general approval. In Chicago, as in New York, the main difficulty will be to accommodate all the exhibitors.

With reference to the motorcycle exhibition to be held at the Panama Exposition in San Francisco in 1915, the committee in charge reported that about 10,000 square feet of space will be set aside for the display of motor single-trackers.

President A. B. Coffman, of the Manufacturers' Association called attention to the fact that he is no longer directly connected with the motorcycle trade and tendered his resignation. It was not accepted, however, the members deciding by a rising vote that

they wished the Toledo booster to continue as their president. As a result Mr. Coffman will remain in office, at least until the annual shows have been disposed of.

It was announced that the hearing on the application of the motorcycle manufacturers for lower freight rates on their machines, east of the Missouri river, will be held before United States Commissioner Prouty in New York City during the current month. Charles Drayton, of New York, has been retained to represent the manufacturers.

After the business session the manufacturers were entertained at lunch at the New Southern by Ignatz Schwinn, who proved an excellent host. Those in attendance were President Coffman, F. J. Weschler, Indian; Arthur Davidson, Harley-Davidson; E. J. Knight, Thor; F. W. Starr and E. E. Hinman, Pope; T. W. Henderson, Henderson; L. J. Carling, Schickel; William G. Schack, Emblem (Mr. Schack still held his perfect score for attending every meeting); Kelly R. Jacoby, Merkel; R. W. Gould, Black Hawk; Guy M. Greene, Eagle and M. M.; H. M. Kirk, Excelsior, and Ignatz Schwinn; Robert Hinds, Yale; Benj. Howard, Flanders; J. D. Hurley, of the Thor staff; W. W. Shoemaker, of Spartan belt fame; I. W. Wilson, representing the Fowler-Carnes Company; S. A. Falor, and W. J. Cameron, of the Goodyear tire forces, and Frank Pambela, designer of the new "Phantom" motor which is being manufactured by the North Chicago Machine Company.

Between periods of handshaking Mr. Shoemaker found time to announce that the Graton & Knight Mfg. Company has set aside a separate department for the manufacture of motorcycle belts in its big Worcester factory, and that the output will be doubled for 1913. Other company representatives and manufacturers hinted at big things, and on the whole the meeting was a record-breaking for enthusiasm and activity. The next session of the motorcycle manufacturers will be held at the Hotel Breslin in New York, on January 15, during the New York Show.

THE "STURDY" CARRIER.

AN unusually handy and dependable luggage carrier which embodies a Prest-O-Lite tank holder is now being sold by Stanley G. Kellogg, of 615 State street, Bridgeport, Conn. The carrier proper has a top surface 12 by 16 inches and a cushion is furnished with patent buckles so that it may be easily strapped to the carrier when it becomes necessary to carry a passenger. The fitment is so constructed that two steel bands, forming a circle to fit the gas tank, may be bolted on. In this way the tank is held securely at the back of the carrier making a pleasing appearance and allowing for economy of space.

SQUIER TO BE BENEDICT.

GEORGE H. SQUIER, well known to the motorcycle trade, and at present connected with the Consolidated Mfg. Co., of Toledo, will be married on Christmas day to Miss Florence Black, of Dayton, Ohio. For the last three months Mr. Squier has been making his home with Jess Campbell, of Dayton, and during this period Campbell succeeded in impressing him favorably with the advantages of domestic life.

MANUFACTURERS

RUBBER PROFITS LESS

International's Gross Income for the Year Reduced by a Million and a Half.

LARGELY decreased profits are shown in the annual report of the Intercontinental Rubber Company. The surplus available for dividends is placed at \$1,108,959, a decrease of \$1,531,559. The company paid out to stockholders in the way of dividends the sum of \$87,500, a decrease of \$1,211,990. This left a final surplus of \$1,021,459, equal to 3.52 per cent. on the \$29,031,000 common stock, as against 8-10 per cent. earned in the previous year. At the annual meeting the report of the directors was read. It said in part: "The year has been marked by a period of interruption of operations caused by revolutionary disturbances, which conditions, we regret to state, still exist, offering serious difficulties to the free transaction of business with Mexico."

The directors' report further said: "While the company's earnings show a considerable decrease over last year, they were still largely in excess of requirements for dividends on the preferred stock. The directors feel, however, that consideration of dividends on the common stock should be deferred until the situation in Mexico and the future supply of raw material are more assured. Meanwhile, the company remains in a strong financial condition, having cash and quick assets in excess of liabilities of nearly double the outstanding preferred stock."

A RUMOR to the effect that the Ford Motor Company, of Detroit, contemplates marketing a cyclecar, along the lines of those now coming into favor in England, has been officially denied.

SIGNED FOR 1913.

TREASURER W. T. MARSH, of the American Motor Company, of Brockton, Mass., is the second figure from the left in the accompanying photo, and his companions are dealers who have just signed up for their 1913 stocks of Eagle and M. M. machines. At the left is E. G. Zabel, of Bertelson-Zabel & Company, of La Moure, N. D., M. M. dis-

Secretary Marsh of M. M. Company (Second from Left) and Three Hustling Dealers.

tributors for North Dakota; at Mr. Marsh's left are Hugh Scanlan and A. B. Richards, of Scanlan & Richards, Bradley, S. D., distributors for South Dakota. The photograph was taken at Minneapolis, Minn., where Mr. Marsh held a business confab with the M. M. dealers.

SELLING 1913 EXCELSIORS

Toronto Agent Has Already Entered Upon Next Season's Business—The New Models.

TORONTO, Can.—Percy A. McBride has already sold several 1913 Excelsior motorcycles to local consumers, and the latest Chicago product is being eagerly inspected wherever it travels. The new models do not incorporate any radical changes from this year's design, but the machine is readily distinguishable by a new color effect. It is announced here, however, that the company will hereafter concentrate its efforts on the four and seven horsepower models, the six horsepower line to be discontinued forthwith.

NEW DELIVERY COMPANY.

MINNEAPOLIS, Minn.—For some months a company of wideawake young Minneapolis business men has been studying the delivery requirements of local merchants and has undertaken a comprehensive study of delivery service in other large cities throughout the country, with a view to supplying Minneapolis merchants with a form of package delivery that will give the utmost efficiency at the minimum expense. The new firm is known as The Motor Despatch Company and back of it are W. J. Rogers, D. McNott and F. Chapin. Some of the largest stores in the city have contracted for the service of the company. The company is made up entirely of Minneapolis material, from the stockholders to the machines themselves, Minneapolis tri-cars being used.

L. W. Blakeman is making a motorcycle trip from Benton Harbor, Mich., to California.

ANNUAL FISK CONFERENCE.

BRANCH managers and salesmen of the Fisk Rubber Company, of Chicopee Falls,

Mass., were in conference at the factory from September 9 to September 14, preparing for the opening of the 1913 season and mapping

out a broad-gauge sales campaign. The conference ended at a clambake. The photo shows the staff at the outing.

Fourth Annual Banquet Tendered Recently by the Haverford Cycle Company to Its Employees.

ANNUAL HAVERFORD DINNER.

RECENTLY the employees of the Haverford Cycle Company, of 827-29 Arch street, Philadelphia, gathered at the Aurora Hotel in Egg Harbor, N. J., for the fourth annual dinner tendered by the company, and the affair was productive of much enthusiasm. Each year the number of guests has increased and the company's plans for entertaining them have been elaborated upon proportionately. At the recent dinner several of the company's branch managers spoke on trade conditions and the policy which has been responsible for the rapid growth of Haverford business. Following the dinner dancing was provided for, some of the guests participated in a bowling tournament, and there was a high-class vaudeville program.

A COMPLETE LAMP LINE.

AT the plant of the Hawthorne Manufacturing Company, in Bridgeport, Conn., there is unusual activity these days and the company is preparing to go above its high-water mark of the present season with its sales for 1913. The makers of the Old Sol family of lamps will market a very complete line for next season. There will be five models of motorcycle headlights, numbered 1, 2, 8, 13 and 17, with separate generators; two models, 3 and 4, of the self-contained type; three gas tail lamp models, numbered 9, 15 and 16; a guide lamp, a miner's torch; a motorboat stand light; three types of carriage lamps, 7 and 11 self-contained and 12 to be used with a generator, and finally two attractive models of bicycle lamps.

Model 17, a motorcycle searchlight, is between models 1 and 8 in size. It has a 7¼-inch door front with 5-inch magnifying lens and measures 2 inches from burner to mirror lens. It is extremely sturdy and compact. A special hinge is a noteworthy feature. With one change of carbide in the No. 5 generator this lamp will burn for seven hours, throwing a light of 1,200 candlepower.

Practically the entire Hawthorne line has been improved in various points. On model 1 of the searchlights the side lugs are stronger than in the past as are the rear lugs on No. 2. On both models the door catch and knob have been improved and strengthened and the gas chamber is so constructed as to prevent any leakage. This improvement is also found on models 8 and 17. The No. 14 generator, as on all the other models and on the self-contained lamps, has an improved water-feed control. On the No. 5 generator the old thumb nut method of fastening together the water and gas chambers has been superseded by a winged nut. The No. 16 gas tail lamp is supplied with a combined red and white door glass, the red glass throwing the signal to the rear and on the road and the white light being thrown downward by means of a hood, to show the license number. The No. 7 carriage gas lamp has a reversible head, permitting the light to be used on either the right or left side of the vehicle. The No. 12 carriage lamp is similar to No. 7, except that it is not self-contained. In order to have ample manufacturing facilities for the large increase in demand for their products, the Hawthorne Manufacturing Company will build a new factory before next spring, to be three stories and of reinforced concrete construction. It will be about 300 feet long. No location has as yet been selected, but with the help of the Bridgeport Board of Trade the company expects to settle this important point soon.

SPARTAN BELTS POPULAR.

A RECENT letter from the English representative of the Graton & Knight Manufacturing Company, of Worcester, Mass., is to the effect that this firm's Spartan belts are rapidly coming into favor with British motorcyclists. In a reliability trial at Nottingham a short time ago the only machine to get through was equipped with a Spartan belt, and this has led many veteran riders to test the American product with satisfying results.

TURNER ON EASTERN TRIP.

H. F. TURNER, of the Minneapolis Motorcycle Company, is now on an eastern trip for the purpose of lining up 1913 agencies. His route carried him to Boston and through the New England states; thence to Washington, D. C. From this point he will proceed to Baltimore, and then jump to Rochester, N. Y., and make a stop at Buffalo. On his way back to Minneapolis he will also visit Chicago. He reports that dealers all along the line are primed for big business in 1913.

MORE POLICE MACHINES

ORDERS for machines to be used in police department service are still piling up at the Harley-Davidson plant. Two of the latest to be shipped went to the Savannah (Ga.) police, the sale having been made by the Balfour Hardware Company, H-D agents in Savannah. Another order is for a 7 h. police machine to be used in Sheboygan, Wis., the Wald Mfg. Co. having made the sale.

ECLIPSE EXTENSIONS.

WORK has been started on new buildings which will double the output of the Eclipse Machine Company, of Elmira, N. Y., for 1913, and the company is making general preparations for the extension of its business. The factory is now running night and day to keep abreast of orders. A number of large contracts have been signed during the last ten days, one of them calling for 20,000 of the Eclipse clutches.

EXTENSIONS PLANNED.

CANTON, Ohio.—Papers have been filed with the Secretary of State by the Knight Tire & Rubber Company, increasing its capital stock to \$1,500,000. Recently the capital stock was decreased from the original sum of \$500,000 to \$300,000, after which it was increased to \$1,500,000. The increase in stock is for the purpose of making extensions and improvements to the plant. The company was organized two years ago.

FULTON-McCUTCHAN ACTIVITY.

SINCE entering the motorcycle field about two months ago the Fulton-McCutchan Company, of Chicago, formerly the Fulton-Grubb Company, has established a record of unusual interest to the trade and riders in general. During the period mentioned this hustling firm has disposed of 32,000 motorcycle lamps and 17,000 Morse universal lamp brackets, in addition to 8,000 of the Speedo devices that are being used with such satisfactory results for improving carburetion. The company is sales agent for the Victor Lamp Company, of Cincinnati, and for the Jeffery-DeWitt Company, of Detroit, maker of the well-known line of spark plugs. The firm recently bought out the Electro Lamp Company, of Detroit, and these products will also be added to the Fulton-McCutchan line.

John W. Fulton, head of the organization, is a live booster for the motorcycle and motorizing in general and is widely known to the trade. He was recently joined by John J. McCutchan, also a well-known figure in trade circles, owing to the fact that he was for several years manager of the Chicago branch of the Splitdorf Company. E. L. Morse, formerly with the Bennett & Morse Company, of Columbus, Ohio, and E. C. Godfrey, of the Electro Lamp Company, of Detroit, are now on the Fulton-McCutchan traveling staff. A new offering from the company at an early date will be an improved spark plug which is to be manufactured by the Jeffery-DeWitt Company. A snappy new catalog will soon be ready for distribution.

INCREASE IN STOCK.

AKRON, Ohio.—The Buckeye Motor & Cycle Company, of Akron, Ohio, has filed papers with the Secretary of State increasing the capital stock from \$5,000 to \$50,000. The increased capital will be devoted to the enlargement of the company's business.

EYE AND NOSE SHIELD.

AN attractive and practical article of personal equipment for motorcyclists is a recently patented eye and nose shield, to be worn instead of goggles. It is marketed by the Sanitary Sales Company, of Bradford, Pa. The shield proper, while affording complete protection for the eyes, is very light and fastened to its lower edge is a cleverly devised strip of silk gauze which covers the

nostrils. It does not interfere with breathing but prevents dust from being drawn in to irritate the nostrils and throat. It is this desirable feature that justifies the term "sanitary" with reference to the shield. An application addressed to Box 1774, Bradford, will bring a leaflet telling all about the new product.

Heads of Fulton-McCutchan Company, of Chicago. John J. McCutchan at Top; John W. Fulton, Below.

SURRE AWARDS CUP.

W. J. SURRE, tire sales manager for the Continental Rubber Works, of Erie, Pa., returned recently from a trip to the Pacific coast, where he found unusual activity in both motorcycle and bicycle lines. It has been the custom of the genial Continentalite to bring the jobbers of Los Angeles together once a year and hold a bowling match. This year the Continental company donated a cup for the bowler with the highest score, and the competition was unusually keen. The contest was held on September 25. Max Flueckiger, of John T. Bill & Company, carried off the cup with an average of 166⅓. The averages of the other members of Flueckiger's team were as follows: East, of the William H. Hoegee Co., 157; Bill, of John T. Bill & Co., 145⅓; Schaefer, of the Hoegee company, 133⅓; Richmond and Surre, informal competitors, rolled up averages of 167⅓ and 136⅓, respectively. The members of the other team scored as follows: Smith, of the E. F. Merry staff, 148⅓; Merry, 136; Hartmann, of the Hoegee company, 129⅓; Sayre, of the Appeal Mfg. & Jobbing Co., 129; Passmore, of the same staff, 129, and Welborn, also of the Appeal forces, 85.

ANNUAL POPE STATEMENT.

PRESIDENT POPE'S report, embraced in the annual statement of the Pope Mfg. Company, of Hartford, Conn., shows that the company has enjoyed net earnings during the last year amounting to \$251,290 on a gross business of \$3,734,112. The surplus of the company stands over \$1,000,000 after writing off \$440,000 for reserves and for future replacements, scrapping of machinery and deterioration. No doubtful accounts are included in the statement. The company paid 6 per cent. on its preferred stock and made one payment of 1 per cent. on the common.

President Pope says that the plants have been kept in the most efficient condition and the cost of up-keep charged to operations. The inventory was made at actual cost and the item of accounts payable covers invoices that had not matured on July 31. All bills have been discounted.

TACOMA BREVITIES.

TACOMA, WASH.—Motorcycle dealers in this city and vicinity note an unusual demand for machines from the rural districts. Good crops and improved roads are helping to boost sales and agents are already beginning to worry over 1913 deliveries. They fear they will be unable to obtain machines fast enough to meet the demand.

H. H. and W. H. Worthley have opened a headquarters at 505 South K street, where they will handle the Simplex sidecar. They have gone into an energetic advertising campaign, and the sidecar is steadily gaining in popularity in this district.

SALESMEN ARE JUBILANT.

SAVANNAH, GA.—Traveling salesmen from northern manufacturers are just now crowding into Savannah with a view to lining up 1913 business, and the dealers are having a busy time of it. Among recent visitors were Arthur Mitchell, who is now pushing De Luxe motorcycle sales, and A. Griffin, known to the trade as "Smiley," who travels the year round for the New Departure coaster brake folks. Without exception the salesmen predict big things for the coming season.

AN AGENCY WANTED.

MANAGER M. L. Weber, of the Imperial Motor Company, of St. Louis, Mo., announces that he is desirous of getting into communication with manufacturers not already represented by agents in his city, with a view of obtaining the agency for a high-grade motorcycle. The company is located at 3334 South Grand avenue.

NEW COLUMBUS ORDINANCE.

COLUMBUS, Ohio.—City council has adopted an ordinance providing that all vehicles with the exception of baby carriages shall carry both front and rear lights. Included under this ordinance are motorcycles, and every machine will be compelled to carry a white light in front and a red light in the rear. The police department has been given instructions that the ordinance must be strictly enforced.

TO SPEND \$150,000.

THE Goodyear Tire & Rubber Company, of Akron, Ohio, is planning to erect an addition to its plant. The new building will be 250 feet by 60 feet, and five stories high, and will cost \$150,000. This will be the third large structure erected by the company during the present year.

Four Members of Philadelphia (Pa.) Police Department Who Recently Visited the Indian Factory in Springfield, Mass.

MOTOR COPS AT WIGWAM.

LOOKING the picture of health and in a cheerful frame of mind, four members of the motorcycle squad of the Philadelphia police department stopped at the Indian factory recently. They had toured from Philadelphia, choosing this pleasant way of spending their vacation. Lieutenant Fritz, who is the originator of the Philadelphia motorcycle police squad, headed the party, and was accompanied by three sergeants of the squad. They traveled by way of New York, and, with the exception of the lieutenant, all used single-cylinder machines. They had no trouble in getting over the roads. All the machines were sent to the repair department at the factory for inspection, but they needed no repairs.

NEW METROPOLITAN COMPANY.

A. L. COCCHI and Fred Voelker, both well known in metropolitan motorcycle circles, have formed the Metropolitan Motorcycle Repair Company, with headquarters at 320 Amsterdam avenue, New York City. Cocchi has had wide experience in repair lines and Voelker's general motorcycle knowledge has been gained through years of consistent riding and trade activity. The company will be prepared to make side-cars to order, to repair magnetos and do brazing, enameling and overhauling. It is the aim of the proprietors to cater not only for the simpler motorcycle repairs, but to stand ready to perform any service that does not require special factory attention.

NEW CLEVELAND FIRM.

CLEVELAND, Ohio.—The A. T. Hall Cycle & Manufacturing Company, of Cleveland, has been incorporated with a capital stock of \$5,000 to deal in motorcycle accessories, hardware and specialties. The incorporators are: Albert T. Hall, George H. Byers, W. H. Stadler, Clayton C. Townes and A. H. Knapp.

SILBY TO HANDLE MERKEL.

I. H. SILBY, of 4508 Detroit avenue, Cleveland, Ohio, has secured the agency for the Flying Merkel for 1913 and has contracted

for 300 machines. Mr. Silby was formerly connected with the W. Bingham Company, of Cleveland, and is a veteran rider. His establishment is well situated on the West Side and has been completely remodeled. It consists of an office and salesroom, where the new models will be exhibited, with space for accessories, and with a repair shop in the rear. This shop, which will be free to riders who patronize Silby, is equipped with a complete line of tools and is under the management of Wren Morris.

WHEN the new addition to the Tyer Rubber Company's factory in Andover, Mass., is completed in about two weeks the company will be prepared to manufacture tires for all kinds of motor vehicles.

A TEAM OF TIRE-MAKERS.

BY way of proving that men who make good tires can also turn out a satisfactory article in the way of baseball, the employees of the Pennsylvania Rubber Company, manufacturers of Vacuum Cup tires and other rubber products, have organized the team which is shown in the accompanying photograph. The boys have had an unusually suc-

AIDS IN STARTING.

DESIGNED to eliminate the most potent influence toward the invention of new cuss-words, the advent of the Clark Motorcycle starter, made by the W. F. Clark Mfg. Co., 3551 W. 23d st., Chicago, Ill., should be hailed with delight by the legions of riders who waste time, tongue and temper in trying to start a "cold" motor.

The Clark Motorcycle starter is an attachment to be slipped over the end of the auxiliary air port of the carbureter, which can be done by any one in a few seconds. To start the engine, the starter handle is turned to the right, which shuts off the auxiliary air. As soon as the engine is warmed up, the starter handle is turned to the original position, which reopens the auxiliary air valve. If a richer mixture is wanted without stopping to adjust the carbureter, the starter handle is turned to the right until the desired mixture is obtained.

The manufacturers claim for this handy little device that it will materially reduce gasoline consumption. This is a reasonable assertion, inasmuch as a waste of gasoline inevitably results from starting a "bashful" motor. The weight of the attachment is only four ounces.

FRED S. MERRILL, a pioneer in the bicycle and motorcycle business in Spokane, Wash., died on October 2.

HAROLD A. SHAW and John E. Hogge, of Urbana, Ill., are planning to visit Europe, Asia, Africa and Egypt on their motorcycles next summer.

cessful season, finishing second in the Westmoreland County (Pa.) league and breaking even in the city championship series. Besides baseball the Pennsylvania company encourages its employees to take up other sports. A fine tennis court, with shower bath arrangements, is in use and another is being prepared at Paruco Park, the pleasure ground of the company's staff.

CRIMPED OLDFIELD'S TIME.

SOME time ago Barney Oldfield turned off 10 miles in his big racing car in 10:44 1-5 on the track at Butte, Mont., and merely by way of proving that he has no respect for automobile champions, Curnow, a Butte motorcyclist, went out and reeled off 10 miles in 10:39 1-5. This placed him five seconds inside Oldfield's time and made him the idol of local race followers. The photograph shows the start of the 10-mile event in which Curnow and his Indian crimped the Oldfield mark for the track; Curnow is the fourth rider from the left.

DALLAS RACES DRAW WELL.

IN the motorcycle races held in connection with the Dallas (Texas) Fair, Frank Harter, of Dallas, covered three miles in 3 minutes, 32 seconds, in a race against time, while Charles Crawford won first place in all four competitive events. B. F. Connor was in charge of the races. The weather was ideal and the grounds were crowded, these being the first motorcycle races many of the spectators had seen.

FIRST ENDURANCE RUN.

THE first motorcycle endurance run held in Washington, D. C., took place October 13-14, under the auspices of the National Capitol Motorcycle Club. The riders left Washington at 6 a. m., Sunday, with Philadelphia as the objective point of the first day's run. The route pursued was via Lancaster and the distance was 178 miles. On Monday they returned to Washington, via Havre de Grace and Baltimore, covering 150 miles.

NOVEL RACING MACHINE.

J. A. LENZ, a Virginia racer, appears in the accompanying photograph on the special Flying Merkel with which he made an

excellent showing in a recent meet at Jamestown. The machine is an interesting hybrid, frame and tank having been built by Michael Suttle, Merkel agent in Newport News, Va. A 7 h. motor is fitted.

A SHORT GRASS STAR.

PAUL WARNER carried off the honors in the recent state meet of the Kansas Short Grass Touring Club, which was a success despite threatening weather. Warner won first place in all the professional events, and took the gold medal for the state championship. There were nine events in all and Warner took first place in six of them.

Start of 10-mile race at Butte, Mont., in which Curnow (second from right) lowered Barney Oldfield's time for the track.

FINE RUN BY DOLPH

Rochester Endurance Trial Proved Worthy of Its Name, Only One Rider Keeping His Score Intact.

ROCHESTER, N. Y.—After repeated attempts the Rochester Motorcycle Club succeeded in pulling off its annual endurance run on September 29. The route included all kinds of roads, including sand and clay. It ran through Scottsville, LeRoy and Warsaw to Mt. Morris and back through Geneseo and Avon. The cold, raw weather kept the entries down to fifteen when the starting gun barked, and twelve miles out a stinging, drizzling rain started in for the day.

From Scottsville to Warsaw the run became an elimination trial; those checking in at Warsaw being Dolph, P. E. M.; Wagner, P. E. M.; Hendee, P. E. M.; Strobel, Harley 7; Heckman, Indian 7; Yells, New Era; Turner, P. E. M. The greasy clay proved too much for the others. Just outside of Warsaw is a two-mile hill and in the rain its ascent made climbing a greased pole tame by comparison. Dolph, Wagner and Hendee reached the top, where Wagner's clutch balked. Hendee had clutch trouble later, which he repaired on the road, finishing 5 hours late.

Dolph got through the mud to Mt. Morris, reaching the control with five seconds to spare. From here the roads were a little better and he finished at the home control on time, half frozen, but with a perfect score.

A NOVELTY RACE.

BALTIMORE, Md.—A novelty race, in which two motorcycles participated, was run at the Laurel track on Friday, October 4. There were two foot runners, two motorcycles, two horses and two automobiles and the contestants were given proper handicaps. The two foot runners came in first but only a flash before the flying motorcycle of T. R. Dedge, of Washington, who would have easily won the race had not the runners got away before the starting flag dropped. F. M. Day, mounted on another motorcycle, failed to come in on the money, while the horses and automobiles did not have a chance.

FOUR motorcycle races held in connection with the Binghamton (N. Y.) Industrial Exposition on September 27 were the feature events of the day.

BIRKENBACH WINS HOUR RACE.

COLUMBUS, O., Oct. 13.—Leo Birkenbach, on a Thor, captured the big race in today's program on the one-mile dirt track at the Driving Park. The race was an hour affair, Birkenbach besting Don Klark in the last stage of the event and making 65.4 miles for the 60 minutes of riding. All the races were close and a large crowd was in attendance, despite cool weather. First honors were divided between Klark, Birkenbach, Yates, Hare and Snyder. Summaries:

Three miles, 30.50 open; won by Bascom, Thor; second, Dressel, Indian. Time, 3:24 4-5.

Five-mile professional, 61 open; won by Klark, Indian; second, Evans, Indian; third, Birkenbach, Indian. Time, 4:31.

Four-mile amateur, 61 class, stripped stock; won by Bascom, Thor; second, Yates, Indian; third, Woolley, Indian. Time, 3:56 1-5.

Five-mile professional, 30.50 open; won by Evans, Indian; second, Hare, Indian; third, Birkenbach, Thor. Time, 5:11.

Pursuit race, ten miles, 61 open; won by Evans, Indian; second, Klark, Indian; third, Birkenbach, Indian. Time, 8:59.

Six-mile professional, 61 open; won by Evans, Indian; second, Klark, Indian; third, Birkenbach, Thor. Time, 5:27.

Five-mile amateur, 61 stripped stock; won by Woolley, Indian; second, Yates, Indian; third, Miller, Indian. Time, 5 minutes.

Hour race, professional, 61 open; won by Birkenbach, Thor (64.5 miles); second, Klark, Indian; third, Snyder, Merkel.

A RUN to Harper's Ferry, via Frederick, over 150 miles of scenic country in western Maryland, was recently held by the Maryland Motorcycle Club.

Wrecked machines of Eddie Hasha and Johnnie Albright at Newark.

RELAY TRIAL POSTPONED

Impassable Roads in the West Force Officials to Call Off Test Trip from Ocean to Ocean.

OWING to the fact that many of the roads along the route of the proposed relay trip from New York to San Francisco were found to be practically impassable at latest reports, the F. A. M. cross-country test, which was to have started from the eastern metropolis on October 12, was called off at the eleventh hour. Chairman J. P. Thornley, of the F. A. M. competition committee, who was to have carried the official message on the first relay, received a telegram from Charles Fuller Gates, chairman of the relay committee, instructing him to this effect and explaining that it would be inadvisable to send the riders on their coast-to-coast journey before May, 1913.

It is pointed out that some stretches of the trans-continental route afford the hardest kind of going, even under the most favorable weather conditions, and that to attempt a trip over these roads with the fall season at hand would be little short of foolhardy. Practically all the arrangements had been made for the trial and the gold-lettered leather case in which the message was to have been carried to the Pacific Coast was ready in Doctor Thornley's office in the Hotel Ansonia, New York City, when the Gates telegram arrived. The relay trial was planned with a view of ascertaining with what speed a message could be carried from coast to coast so that army officials might be enabled to form a more definite opinion of the motorcycle's value as an emergency vehicle for military service.

STATE COMMISSIONERS NEEDED.

PRESIDENT PATTERSON announces that F. A. M. State commissioners are either appointed or under consideration for all the States except Delaware, Florida, Illinois, Indiana, Kentucky, Mississippi, Maine, Minnesota, Massachusetts, North Carolina, Nevada, North Dakota, Oklahoma, Wyoming and Indian Territory, and he is desirous of getting into communication with Federation workers who are willing to fill out the list. To this end he suggests that factory representatives supply him with the names of active dealers in the States which still lack commissioners.

A FOUR-TIME WINNER.

FORTUNE varies considerably regarding the winners of classic motorcycle events, but in the English Six Days Trials, an annual event, one crew has obtained the team prize for four years in succession. This is the Phelon and Moore team, of which W. Pratt, of London, is captain. He is here shown after finishing the 1912 trials, where he again captained the winning team.

SIX SCORES INTACT IN CHICAGO GRIND

Twenty-Mile an Hour Schedule Combined with Sand and Clay Pulled Down the Averages of Contenders for Chicago M. C. Trophy

Jack and Dick Purdy on Chicago M. C. Endurance Run. The Latter Scored Perfectly.

OSCAR PERSONS and R. F. Purdy, Harley-Davidson sevens; J. B. Mason, Indian 7; L. C. Davis, Excelsior 7; Dale Smart, Thor 4, and Thomas Monroe, Sears 7, finished with perfect scores in the Chicago Motorcycle Club's semi-annual endurance run for a handsome trophy. The 193-mile course was from Michigan City, Ind., to South Bend, Ind., Joliet, Ill., and Chicago. The riders left Michigan City at 8 a. m. on October 5 and found controls at South Bend, La Porte, Valparaiso, Dyer and Joliet. The return run was via Dyer and thence to the clubhouse in Chi-

cago. The schedule called for 20 to 23 miles per hour, and at each of the controls the contestants were required to check in on the minute, making it very difficult to keep a perfect score.

The course afforded a wide variety of road surfaces, and many sand and clay stretches were encountered. Between Dyer and Joliet the route could not rightly be called a road; it was little more than a trail. This section was made up of sticky clay, part of which had dried out, leaving deep ruts.

Side-Lights on the Run

Jack Purdy, after covering more than half the course with a perfect score, was finally awarded highest honors for punctures and blow-outs, having four in less than six miles. The Purdy brothers, Jack and Dick, are shown in the accompanying photograph.

Jack Mason, who recently did some clever amateur riding at the Riverview Motordrome, struck a rock while riding at high speed in a deep wagon rut and soared skyward, but managed to alight feet first and was uninjured.

A short distance from Michigan City, Boedecker struck several ruts and took a hard spill. With the aid of several passing tourists he was able to patch up his machine and ride back to Chicago.

Barlass was last seen bending over a water trough in New Carlisle, "looking for bubbles."

Oscar Persons and Dick Purdy, riding Harley twins, made a fast run from LaPorte to Valparaiso, a distance of 22 miles. They covered this stretch in 32 minutes.

FROM SECRETARY GIBSON.

IT was with reluctance that Secretary Gibson submitted a report to the effect that no clubs were affiliated or repair shops registered during the week ending October 12. These conditions have not existed previously in many moons, and the National Secretary wants it understood that one week of inactivity along these lines is plenty. He is now anxiously awaiting reports from clubs and repairmen with a view to making up lost time.

The National Secretary announces that a new supply of F. A. M. stationery has been received and that shipments will be made promptly to commissioners who make application. Doctor Gibson has also forwarded the new certificates for State Commissioners to President Patterson, who will send them out to his appointees.

The F. A. M. has just paid its eighth \$25 reward for the recovery of a motorcycle stolen from a member. Chief of Police Charles J. McCabe, of Poughkeepsie, N. Y., located a machine which had been stolen from Horace Van Dusen, of Poughkeepsie, and the Federation check was forwarded as soon as the necessary papers were on file.

GOODYEARS ON LONG TRIP.

MR. AND MRS. HARRY HUMPHRIES, now on their way around the world on a Minneapolis machine fitted with a tandem attachment, use Goodyear tires and report that they are standing up wonderfully under the strain of carrying the double load over good, bad and indifferent roads.

\$1,000,000 TO \$2,000,000

Federal Rubber Manufacturing Company Increases Its Capital Stock.

THE Federal Rubber Manufacturing Company, of Milwaukee, on Saturday last filed in the office of the Secretary of the State of Wisconsin amendments to its articles of association, increasing its capital stock from \$1,000,000 to \$2,000,000, the increase consisting of 7% preferred stock, redeemable at 120. The increased capitalization has been made necessary by the phenomenal growth of the Federal Company's business in the past year, during which time the actual sales have exceeded the estimated sales for the year by \$400,000, and to provide for future expansion.

In May of last year, the Federal Rubber Manufacturing Company purchased the plant of the Federal Rubber Company at Cudahy, since which time the present company has made extensive additions to the plant, practically trebling the floor space of the original plant.

Additional buildings and other improvements are now under way, including a new power plant aggregating 3,500 boiler horsepower, and a further addition to the office building. This work is made necessary by immediate requirements of the business and, when completed, the total expenditures for improvements will represent approximately \$50,000, giving the company about 250,000 square feet of floor space, providing employment for between 1,000 and 2,000 men.

F. A. M. GAINS IN SEPTEMBER.

F A. M. membership gains for September were as follows: Maine, unaffiliated, 1; renewals, 1. New Hampshire, unaffiliated, 2. Massachusetts, affiliated, 17; unaffiliated, 14; renewals, 14. Rhode Island, affiliated, 2; unaffiliated, 2; renewals, 11. Connecticut, renewals, 2. New York, affiliated, 12; unaffiliated, 21; renewals, 23. New Jersey, affiliated, 5; unaffiliated, 7; renewals, 6. Pennsylvania, affiliated, 14; unaffiliated, 19; renewals, 15. Maryland, affiliated 5; renewals, 3. Virginia, affiliated, 5; renewal 1. West Virginia, renewal, 1. District of Columbia, renewal, 1. North Carolina, affiliated, 3. Tennessee, affiliated, 6; unaffiliated, 1; renewals, 2. Georgia, affiliated, 2; renewal, 1. Florida, renewal, 1. Alabama, renewals, 2. Texas, affiliated, 12; renewals, 4. Kentucky, renewals, 2. Ohio, affiliated, 38; unaffiliated, 38; renewals, 30. Indiana, affiliated, 53; unaffiliated, 2; renewals, 9. Illinois, affiliated, 41; unaffiliated, 6; renewals, 14. Missouri, affiliated, 10; unaffiliated, 2; renewal, 1. Wisconsin, affiliated, 14; unaffiliated, 6; renewals, 3. Michigan, affiliated, 16; unaffiliated, 8; renewals, 3. Minnesota, affiliated, 1. South Dakota, affiliated, 2. Nebraska, unaffiliated, 1; renewal, 1. Kansas, affiliated, 20; unaffiliated, 3; renewals, 3. Iowa, affiliated, 11; unaffiliated, 2; renewals, 2. California, affiliated, 23; unaffiliated, 4; renewals, 16. Utah, unaffiliated, 2; renewals, 7. Colorado, affiliated, 23; unaffiliated, 1; renewals, 17. New Mexico, affiliated, 2; unaffiliated, 2. Arizona, affiliated, 1. Idaho, affiliated, 4; unaffiliated, 1. Oregon, affiliated, 1; unaffiliated, 1; renewal, 1. Washington, affiliated, 38; unaffiliated, 3; renewals, 30. Total, affiliated, 381; unaffiliated, 149; renewals, 227.

MEMBERS of the Aberdeen (S. D.) Motorcycle Club recently made a Sunday afternoon jaunt to Tacoma Park.

Members of Sioux City M. C. Watching an Aeroplane on a Recent Outing.

REGISTERED REPAIR SHOPS.

F A. M. repair shops were registered for the week ending October 5, as follows: Tracy E. Davis, 307 East State street, Ithaca, N. Y.; Wedge Garage Co. (P. D. Gath), 170 South Sixth street, Zanesville, Ohio.

NEW STAFF CHOSEN.

AT a recent meeting of the Fort Wayne (Ind.) Motorcycle Club the following officers were elected: A. C. Aichele, president; L. Mommer, vice-president; C. F. Shorey, secretary, and William Dreibelbiss and W. Brass, treasurers.

NEW F. A. M. CLUBS.

NEW clubs affiliating with the F. A. M. in September, as reported by Secretary Gibson, were as follows: Yakima M. C., Yakima, Wash.; Trinidad M. C., Trinidad, Colo.; Jefferson M. C., Jefferson, Wis.; Anderson M. C., Anderson, Ind.; Chicago Heights M. C., Chicago Heights, Ill.

PRESIDENT PATTERSON has reappointed the following F. A. M. State Commissioners: E. B. Ewell, Richmond, Va.; J. A. Campbell, Dayton, Ohio.; G. Eugene Lain, State College, New Mexico; Dr. B. Y. Leslie, Pasadena, Cal. New appointments were made as follows: J. D. Miller, Atlanta, Ga.; J. Benton Lindsay, Portland, Ore.; G. E. Woodwell, Wichita, Kan.; W. D. Gresham, Birmingham, Ala., and M. H. Hawkins, Jerome, Ariz.

C. M. A. CHAMPIONSHIPS.

IN spite of adverse weather conditions and a soft track the C. M. A. Western Championship races were pulled off at the Kirkfield park track, Winnipeg, Manitoba, Can., on October 5. Joe Baribeau and Jimmy Cruickshanks were the star riders of the day.

BATTLE CREEK CLUB.

BATTLE CREEK, Mich., now has a motorcycle club, and the photograph shows a few of the riders lined up for a recent informal run. A. J. Rush is president of the new club; Charles Skinner, vice-president; E. W. Mallernee, secretary, and R. Cummings, treasurer. It is the intention to affiliate the squad with the F. A. M. on a 100 per cent. basis.

Headquarters of Wolverine Auto-Cycle Company, in Battle Creek, Mich.

AMONG THE CLUBS

Imperial Riders of Brooklyn, N. Y., in the Wilds of Staten Island on a Recent Sunday Outing.

RUN TO EGG HARBOR.

THERE was a highly creditable turn-out of members of the Harley-Davidson M. C., of Philadelphia, Pa., for a run to Egg Harbor, N. J., on September 29, no less than 111 riders making the round trip. Ideal weather and good roads made a combination which permitted the squad to enjoy every minute of the outing. At the American Hotel in Egg Harbor City a chicken dinner was served, with Alexander Klein, of Philadelphia, and W. Heckenhorn, of Camden, N. J., as the hosts. Klein and Heckenhorn are Harley-Davidson agents in their respective cities. Incidentally, the outing marked the first anniversary of the organization of the club.

NEW CLUB FORMED.

THE Central Jersey Motorcycle Club, of Trenton, N. J., has disorganized owing to friction between the riders of different makes of machines. Ninety per cent. of the members were Indian riders and they have formed a new club and will have their headquarters over the store of John Sykes, Jr. Sykes is the Indian agent and has given the space without rent so that the dues will be spent for monthly smokers or theater parties. Bowling teams have already been formed.

A NORFOLK CELEBRATION.

BY way of celebrating the success of its Labor Day race meet, on which it cleared \$400, the Twin City Motorcycle Club, of Norfolk, Va., recently gave a banquet at the Lynnhaven Hotel.

NOTES OF BALTIMORE RIDERS.

BALTIMORE, Md.—A "Sweetheart Trip" was taken Sunday, September 29, by the members of the Maryland M. C. Every rider used a tandem and seated behind was his wife or sweetheart. The idea to give the ladies an outing in this way was taken up with enthusiasm as soon as it was announced, and when the start was made for Laurel the women folks were there in all their glory. The run down to the Midway City is a short one and was made in good time.

On Sunday, October 6, the members of the club had a strenuous run to Harper's Ferry, W. Va. It was the second journey over the mountains for the boys and they thoroughly enjoyed the beautiful scenery and splendid roads. The local contingent was swelled by riders from Frederick and Woodbine, who joined the bunch this side of the mountains.

G. H. Heinz and August Zimmerman left last Friday for a trip north. Their journey will be through the New England states with Springfield, Mass., as their ultimate destination. Zimmerman only recently made a similar trip, and now the two boys have left with the determination to break Zimmerman's record.

Motorcycle races will again be the big feature at the Frederick County Fair, at Frederick, Md. Valuable prizes will be offered and entrants are expected from this city and Washington.

FIVE members of the Wichita (Kans.) M. C. recently made an all-day run to Eureka. They left Wichita at 9 a. m., reached Eureka at 2 p. m. and arrived home at 7.30.

A SUNDAY run to Beaver Dam, via Sun Prairie and Columbus, was recently held by the Four Lakes Motorcycle Club, of Madison, Wis.

BLACK HILLS CLUB IS ACTIVE.

AT the last meeting of the Black Hills Motorcycle Club, of Deadwood and Lead, South Dakota, it was voted to have a dance and masquerade at an early date, and the largest hall in Lead has been procured for the affair. The proceeds will be used in fitting up new club rooms. It was also decided to hold a hill climb before the last of October. A. J. Walley, club president and State F. A. M. commissioner, and Phil. Schoenberger, the local Yale agent, are waxing enthusiastic over a plan to have a South Dakota tour similar to the Short Grass Tour of Kansas.

TERRE HAUTE OFFICERS.

AT the annual election of the Terre Haute (Ind.) Motorcycle Club the following officers were chosen: Roy Forbeck, president; Guy Jackson, vice-president; Fred. Stahlacker, secretary; Edward Wagner, treasurer, and A. C. Ferguson, road captain. Members were also chosen for the entertainment, racing and membership committees.

ATTENDED ROAD CONGRESS.

A NUMBER of motorcyclists of Plainfield, N. J., together with members of various other clubs, whom they met at Point Pleasant, participated in a sociability run to Atlantic City recently to attend the opening of the American Road Congress at which Governor Wilson was one of the speakers.

ENTERTAINED AT CLEVELAND.

WHILE in Cleveland, the Ohio State F. A. M. contestants were entertained by the Cleveland M. C. A theater party was given at the Empire and a section reserved for the riders and members of the club.

Indian M. C. of Trenton, N. J., Ready for a Recent Run to Asbury Park.

GEAR RATIO AND SPEED TABLE

Calculated for 28-inch Wheel

Compiled by D. R. HOBART.

THE subjoined table has the gear ratios from 3 to 6½ in the left-hand vertical column, and motor speeds horizontally in the upper column across. The upper row of figures, printed in full face, gives the number of revolutions of the rear wheel per minute and the lower row the speed in miles per hour.

To use the table select the gear ratio desired and move horizontally until directly under the approximate motor speed figure. In the square at the junction of the gear ratio and motor speed lines will be read the speed of the machine in miles per hour and the number of revolutions of the rear wheel. Example: 4:1 gear, 2400 revolutions per minute of motor. The rear wheel will revolve approximately 600 times a minute, and the speed will be 49.7 miles per hour. For a 26-inch wheel, multiply the figures by 13/14.

FORTY-FIVE FINISHED

In Annual Triangle Run of the Providence M. C.—A List of the Participants.

WITH fifty motorcyclists starting, including five sidecar passengers, and forty-five finishing, the annual Triangle Run of the Providence (R. I.) Motorcycle Club, held on October 6, was one of the most successful affairs ever undertaken by the squad. A large crowd gathered at Exchange Place to witness the start, which was made at 7 a. m., four riders leaving every minute, until the full party was on the road. Long before the riders were due to finish, so large a crowd had assembled that the participants had difficulty in forcing their way to the checkers. They reported in squads, as in starting, and most of them arrived before 3 o'clock, the schedule time being 4 o'clock.

Charles Gustafsen, a well known rider and a tester at the Hendee plant, was among the contestants with a 1913 Indian. B. A. Swenson rode a 4 h. Indian, with sidecar and passenger, and kept up with the fastest of the bunch. At one time he set the pace, pushing ahead of the other machines whose riders at once opened up and cut out a lively clip. This was the cause of a few spills but no one was injured. Frank Labonta took a spill in leaving Worcester and he had to stop to make repairs; this left him eight minutes late in Providence. Fred. Peterson, of Providence, sustained an injury to one of his knees as the result of a collision with Russell Coes, of Worcester.

The most spectacular fall was that of Secretary J. G. Edwards who took a spill on a curve. Seeing the machine going from under him he slid off and the motorcycle turned completely over and landed upside down in the road, on the saddle and handlebars, with the engine going full tilt. No damage was done.

Most of the roads were in good shape and all the riders had an enjoyable trip. This run closed the club's 1912 touring season and the next big event will be the annual Herring Run which will mark the opening of the 1913 season. Members of the club will continue riding until the cold weather sets in and the club has arranged for a pool and whist tournament for the winter. Monthly socials will also be held.

The following is a complete list of participants in the Triangle Run: Providence.—Chas. Westcott, 4, Indian; E. L. Buffington, 4

Indian; F. Labonta, 7 Indian; C. A. Anderson, 7 Indian; F. A. Lutzer, 7 Indian; W. C. O'Brien, 7 Indian; J. C. Garanil, 7 Indian; M. Ross, 7 Indian; J. G. Edwards, 7 Indian; F. Peterson, 7 Indian; C. Litterio, 7 Indian; E. G. Luther, 7 Indian; C. W. Rayhill, 7 Indian; H. W. Munroe, 4 Indian; G. W. Lane, 7 Excelsior; Miss C. Ross, sidecar; A. V. Howe, 7 Indian; T. Howe, sidecar; B. A. Swenson, 4 Indian; Miss E. Smith, sidecar; F. O. Johnson, 7 Indian; J. Loftus, 4 Harley-Davidson; Arthur Dio, 7 Indian; C. H. Frazier, Pawtucket, R. I., 7 Indian; T. J. Conroy, East Greenwich, R. I., 7 Indian; W. L. Emin, Stillwater, R. I., 7 Indian; C. W. Alibrich, East Providence, R. I., 4 Indian; L. W. Ludden, Brockton, Mass., 7 Indian; E. Grove, Brockton, Mass., 7 Indian; W. H. Errishaw, Jewett City, Conn., 6 Merkel; H. F. Hildreth, Somerville, Mass., 6 Merkel; T. Asherlund, Somerville, Mass., 6 Merkel; Russell Coes, Worcester, Mass., 7 Indian; Chas. Gustafsen, Jr., Springfield, Mass., 7 Indian; P. A. Merhoff, Boston, Mass., 7 Indian; A. J. Gaudreau, Fall River, Mass., 7 Indian; J. Parent, Pawtucket, R. I., 4 Indian; Arthur Izzi, East Greenwich, R. I., 4 Harley-Davidson; C. A. Sherman, Middleboro, Mass., 4 Thor; L. Bryant, Middleboro, Mass., 4 Thor; Howard

J. S. Vogel,
Manager and
General
Publicity
Man for
the Chicago
Motorcycle
Show.

Clark, Worcester, Mass., 7 Indian; L. Robinson, Worcester, Mass., 7 Indian; Glen Crandall, Boston, Mass., 5 Thor; Lincoln Holland, Jr., Los Angeles, Cal., 5 Monarch; A. R. Braman, Newport, R. I., 7 Indian; C. Lurson, East Saugus, Mass., 7 Indian; James Baxter, Boston, Mass., 7 Indian with sidecar; D. A. Rowley, Dedham, Mass., 6 Merkel, with sidecar and passenger.

BIG PITTSBURGH TURN-OUT.

NOT less than 15,000 people witnessed the thrilling motorcycle races at Schenley Oval, in Pittsburgh, recently under the auspices of the Pittsburgh Press. A. G. Schmidt did some excellent riding and won four out of the five events.

ON TRIP TO TEXAS.

MR. AND MRS. S. J. SADLER, of Oakland, Cal., are making a motorcycle tandem trip from their home to Houston, Tex. They report little or no difficulty in covering the mountain roads.

PLANNING BROOKLYN BOWL.

CHARLES T. EARL, of Brooklyn, N. Y., is making an effort to procure Washington Park, formerly the home grounds of the Brooklyn National League baseball team, for the purpose of erecting a motordrome.

BREVITIES

NEW ORLEANS, La., has a force of eighteen motorcycle special delivery boys on its postal staff, and the post office at Madison, Wis., has also adopted the motorcycle in its special delivery service.

THE Balfour Hardware Co., of Savannah, Ga., agents for the Henderson, report the sale of two machines to ex-president Dawson Wyley, of the local club, and Young Comer, also of Savannah.

THE City Council in Berkeley, Cal., recently decided to allow a definite sum for the up-keep of motorcycles owned by patrolmen and sometimes used by them on official business.

OUT of thirty-five starters in the recent endurance run of the Rackford (Ill.) M. C. only eleven reached Chicago and but ten returned. Ralph Olson (Indian), A. S. Johnson (Harley) and Carl Swenson (Harley) tied for first place with 998 points.

HALE FLETCHER, motorcycle officer of Coffeyville, Kans., has returned from a ten days' vacation which he spent on his motorcycle. The officer toured southern Kansas.

SUCH satisfactory service was rendered by the two motorcycle cops in Tampa, Fla., during the last year, that the department has purchased two additional machines.

DR. JAMES MCCOY, of New Wilmington, Ill., although 83 years of age, owns a motorcycle and enjoys his trips about the country as keenly as any youngster.

A CLUB run to Newburgh was recently held by members of the Middletown (N. Y.) M. C. under the direction of Captain Foote and Lieutenant Decker.

SEAL ROBINSON, representing the Grand Forks (N. D.) Evening Times, is en route on a motorcycle trip to the Pacific coast.

JOHN HOGAN, a motorcyclist of Saginaw, Mich., plans to visit every capitol in the United States on his machine next summer.

George Rentel, Class B. Chicago Motordrome.

POINTERS FROM A MINNESOTA DEALER

Veteran Booster Describes Several Handy Devices for Riders and Also Suggests Two Wrinkles for Repairmen

F. C. DOLDER, who operates F. A. M. registered repair shop No. 289, in St. Charles, Minn., is a practical mechanic as well as a rider of experience, and the equipment of his headquarters embraces many ingenious devices. Being of an inventive turn of mind he is constantly reaching out for something new and frequently he hits upon an idea worthy of general application to the motor two-wheeler. On this page are shown several sketches embodying suggestions offered by the St. Charles repairman.

The first illustrates a pennant fastener, which has been tried out by the riders in and about

St. Charles and found to meet all the requirements. The pennant is fastened to a round hardwood stick and screwed into the pipe coupling, and the contrivance may be placed in any position on the handlebar. The method of arranging the coupling with reference to the band iron and bolts which encircle the handlebar is clearly shown in the diagram.

Another suggestion from Dolder has to do

with a whistle control. The St. Charles dealer argues that such a control should be so placed that the rider does not have to hunt for it and fumble unnecessarily in operating it. To meet these requirements he has devised a control which is operated by the rider's knee.

Double Priming System.

To Straighten Bent Rim.

The diagram shows how this contrivance may be applied to a twin machine.

With cold weather coming on Dolder has also turned his attention to a priming device and has perfected a system which permits of priming both cylinders without a moment's delay. The diagram shows how he leads a thin pipe from the gasoline tank to the cylinders, a cut-off being fitted near the tank as shown for the purpose of running the gasoline when necessary.

In another sketch is shown Dolder's method of straightening a bent rim. He points out that a monkey wrench is clumsy, and that a Stillson properly used will do the work neatly and with no loss of time.

With a view of assisting his brother repairmen, Dolder has prepared the accompanying plan of a work-bench for a motorcycle shop. The planks on either side are used as runways and the center top section of the bench lifts out when the machine is straddling it, so that the mechanic has ready access to the tools which are kept in a sort of cockpit. He also suggests that dealers obtain a common wire-stretcher such as farmers use for stretching wire fences, and fasten it in the ceiling of the shop to be used as a block and tackle. It may be used for lifting either wheel of a motorcycle from the floor, and is capable of

sustaining the entire weight of the machine if necessary. Dolder asserts that this wrinkle is the handiest in the world for trueing up the wheels or adjusting cones. The wire-stretcher costs only fifty cents.

While Dolder's spark plug idea is not new, it is worth a mention. He points out that the plug should not be placed as in the first sketch, as a pocket is thus formed in the cylinder head to collect oil and foul the plug points, but as shown in the second drawing. In this diagram the plug proper is flush with the

inner surface of the cylinder and the points project into the explosion chamber.

In his last suggestion Dolder becomes jocular and outlines a method of fastening a watch so that it will not jar loose from the handlebar. He recommends that the rider obtain a good watch, worth anywhere from \$50 to \$70, and have a blacksmith punch a 1/4-inch hole through the whole outfit, works and case, just over the second hand, and another similar hole below the number 12. A

1/4-inch steel bar is then bent and passed through the holes, the completed job appearing as shown in the sketch. Dolder and his assistants assert that no watch fastened in this way has ever been lost through jarring loose.

PRESS MACHINE TAKEN.

A 1912 Harley-Davidson, belonging to the Lafayette (Ind.) *Morning Journal*, which had been left in front of the office, was stolen recently. The words "Morning Journal" were painted on the left side of the gasoline tank and above "Harley-Davidson" on the right. The machine is equipped with free wheel control, Goodyear studded tires, Troxel saddle and Thor brake. The engine number is 2435B, and license No. T-14-53.

MAINE TO CALIFORNIA.

NELSON L. MOULTON is riding a motorcycle from his home in Ketterly Depot, Maine, to San Francisco. He mounts a twin Excelsior and is devoting considerable time to the trip as he is visiting friends along the route.

WANT GONGS SOUNDED.

COFFEYVILLE (Kans.) motorcycle riders are up in arms on account of the failure of street car motormen to sound gongs. Several accidents have been narrowly averted. A petition to have the city commissioners pass an ordinance requiring carmen to use the foot gong will be prepared.

SECRETARY J. M. McDONALD, of the Mississippi State Fair Association, has announced an interesting program of motorcycle races to be held October 24, 25 and 26.

"Yale Team Wins Again"

The Yale Team has annexed another Trophy

This time it is the Ohio State F. A. M. Lake-to-River, 600-Mile Endurance Run in which the "Y" has come through a winner.

Starting from Toledo, October 11, the contestants made for Cincinnati, by way of Upper Sandusky, Mansfield, Cleveland, Akron, Canton, New Philadelphia, Zanesville, Newark, Columbus, Springfield, Dayton and Middletown.

On the first day's run to Cleveland the most wretched sort of roads were encountered—the result of a three-days' rain.

Again the Yale proved itself superior to the worst of road conditions.

Again the "Y" team was the only factory team to finish even the first day's journey.

Again the three members of the "Y" team flashed into the last checking station at Cincinnati, on October 13, ahead of all others—the only team to finish intact.

Again Jacobs had a perfect score; Squier had a perfect score, and Campbell had

a perfect score—minus four points a policeman took off by holding him up.

It's another glorious victory for conscientious Yale standards; for painstaking "Y" practice.

At Fort Ancient Hill the majority of riders had to pedal up the 23% grade.

Again the Yale proved self-sufficient—the "Y" team had no need for pedals—the "Y" motor went right on as on the straightaway.

Coming after the Yale victory in the Middletown-to-Elyria run and the capture of the Manufacturers' Trophy in the New Jersey 24-hour endurance run, doesn't this latest "Y" achievement prove to you the advantage of Yale construction?

Just what does it mean when the other teams fall by the wayside—and the Yale team crosses the line a winner?

"Yale Again Wins Reliability Run"—you read it everywhere.

HOW THE MOTORCYCLE HELPS.

MANY lovers of duck hunting have found that in order to reach a satisfactory shooting-ground it has been necessary to make a tiresome railroad journey, but of late the motorcycle has solved the transportation problem to such good effect that no hunter need worry over this phase of his outing. The accompanying photographs show how one sportsman utilized his Harley-Davidson machine to get within reach of the elusive ducks.

BUCKINGHAM-HAZLETT.

ANNOUNCEMENT is made of the marriage of Joseph Buckingham, of New York City, and Miss Myrtle Bertha Hazlett. Mr. Buckingham is manager of the motorcycle department of the Weaver-Ebling Company, of New York, Harley-Davidson agents in the metropolis. Mr. and Mrs. Buckingham will reside at 525 West 182nd street, New York City.

AFTER NEW LINES.

HARRY B. COHEN, of the National Capitol Tire and Supply House, of Washington, D. C., will leave shortly on a trip in quest of new products for his firm. The company will handle a full line of automobile and motorcycle tires and accessories and act as direct factory representatives, selling to the wholesale trade only.

MACO CARBURETER.

EXPERIENCED motorcyclists who seek maximum fuel efficiency with minimum expenditure and trouble are finding much to interest them in the simple and sturdy Maco carbureter, manufactured by the Motor Appliance Company, of 71 Warren street, New York City. The main object of the designers of the "Maco" has been to produce a carbureter that the average owner could not fail to understand and that could be adjusted so as to get maximum efficiency with least amount of adjustment. There are but two adjustments, the gasoline for low speed, and the auxiliary air for high speed, and these once regulated become permanent. The float chamber is radial, and the spray nozzle is directly in the center, which insures a constant fuel level

in any position of the engine. The venturi tube in the constant air supply is so placed as to insure a good charge of gasoline, and breaking it up into the finest possible spray. The needle valve adjustment is at the top.

It is suitable for any type of motor, whether two or four cycle, marine, automobile or stationary.

A. BERNSTEIN, Reading-Standard agent at Trenton, N. J., has also secured the Excelsior for 1913.

WITH CLEVELAND DEALERS.

THE K-V. Motorcycle Company, of Lake avenue, Cleveland, which was formerly under the management of George Knapp and Carl Volk, will hereafter be managed by Volk. Volk has bought out Knapp's interest in the firm. He will handle the Henderson exclusively for next season.

THE Welding & Cycle Repair Company has opened up in Cleveland at the old stand of the Yale Cycle & Supply Company, under the management of F. C. Booth and Joseph Pittaway. Welding and brazing is their specialty, while the motorcycle and bicycle repairing business will be taken care of.

WASHINGTONIANS UP IN ARMS.

MOTORCYCLISTS of Washington, D. C., are preparing to wage a legal fight against an unreasonable ordinance which prohibits the carrying of a woman passenger on any motorcycle, no matter how it is equipped, and forbids the carrying of a male passenger except on a regular tandem attachment. The latter clause is not seriously objected to, but the restriction against transporting a feminine enthusiast, regardless of precautions for her safety and the protection of the general public, has aroused a storm of protest. The Washington riders assert that they will carry their case to the Supreme Court if necessary to determine the rights of motorcyclists.

FOR BUILDING INSPECTORS.

THE City of Cleveland has received two new magneto single Harley-Davidsons for use in the Building Inspector's Department, from the Lister Motorcycle Company, of East Fifty-fifth street, Cleveland. This makes a total of eleven machines delivered by the Lister Company this season to the inspectors.

TO MOVE BRANCH.

AS a result of the recent merger of the Diamond Rubber Co., and the B. F. Goodrich Company of Akron, Ohio, the B. F. Goodrich company's stock depot now located at 512 East Long street, Columbus, will be moved to 186 East Gay street, the present quarters of the Diamond Rubber Co. branch.

THE Flying Merkel machines shown in the accompanying photograph were the only motorcycles to participate in the recent automobile parade held in Altoona, Pa. The machine with the Majestic sidecar attached is the

property of W. K. Aurandt, of the Miami company, but it was entered and driven by a Mr. Young, his cousin occupying the sidecar. Mr. Rouser is shown in the center and Mr. Butts on the right.

The **STRENGTH of** **"THE COVENTRY" CHAINS**

THIS illustration shows graphically the weight that every one of "The Coventry" Chains can sustain—twelve riders and their mounts—making a total weight of between 3600 and 3700 pounds.

Can you conceive of a strain exerted by a motorcycle motor that would equal this tremendous weight, which every one of "The Coventry" Chains is prepared to withstand, if need be?

You have heard of Sheffield Steel—which is the "sterling" of steel quality throughout the world. Sheffield cold-rolled steel is alone used in the manufacture of "The Coventry" Chains.

Couple its enormous strength with the other qualifications possessed by "The Coventry" Chain—silence—speed—absence of stretch or slip—and its all-around consistent efficiency, and you have the IDEAL TRANSMISSION.

If you want to be assured of a total absence of transmission troubles on the road, if you want to get the benefit of **every ounce of energy** your motor possesses, if you want to tackle every hill, no matter how steep; every road condition, whether sand, mud or snow, with absolute confidence in your transmission, use "THE COVENTRY" Chains.

To dealers who are looking for a cheap article—the first cost of which is small, but for which the user must pay again and again in annoyances and continual repairs, we have nothing to offer. We pride ourselves on the fact that "The Coventry" Chains are more expensive, as far as first cost is concerned, than other chains. BUT—"they cost more because they are better." Quality counts in the end—and that's our "long suit."

**SARCO ENGINEERING
COMPANY**

**112 BROAD STREET
NEW YORK**

The Harley-Davidson Worcester 24-hour

425 miles in 24 hours over rough country roads and through the Berkshire mountains—the last 225 miles in a blinding rainstorm.

40 entries—38 actual starters—including six organized teams of four riders each, not one of which even completed the contest, to say nothing of winning a perfect score or a trophy.

son Wins the Big Endurance Contest

W. J. Walker, riding his Harley-Davidson, finished first, winning not only a perfect score of 1000 points, but the much coveted Worcester Silver Cup, and the gold medal offered for the best individual performance.

Out of a total of 38 actual starters only four riders were able to finish the contest at all. 225 miles of the run were made in a driving rainstorm. In some places the roads were next to impassable. Heavy mud—deep sand—rocky roads and a number of staggering grades in the Berkshire mountains, including the famous "Jacob's Ladder," made the contest anything but a joy ride.

The Harley-Davidson is designed for service, built for service, and finally renders actual service on the road second to none. No one thing proves it more conclusively than a strenuous endurance run.

W. J. WALKER, WINNER OF THE WORCESTER 24-HOUR ENDURANCE CONTEST
HELD SEPTEMBER 29 AND 30.

The 1913 R-S is practically the same as this year's—only more so

IF it were possible to improve on the R-S, the 1913 model would certainly have contained these improvements. But we are so confident of the superiority of the R-S—so assured of its absolute perfection, that we have turned our energies, that would ordinarily have gone toward evolving new features in the 1913 model, in other directions.

We enlarged our manufacturing facilities. We have directed the brains of our engineers, whose master minds first conceived "That willing winning worker," toward our factory organization. They have devoted their broad engineering knowledge toward a solution of the delivery problem.

We have "tightened up" our manufacturing facilities—discarded some methods which meant lost time and did not increase efficiency. We have retained our rigid inspection system. We have reorganized our plant on a purely engineering basis, and can assure quicker deliveries **WITHOUT SACRIFICING THAT PAINSTAKING, CONSCIENTIOUS CARE THAT IS THE BASIS OF R-S PERFECTION.**

Our catalog is ready for you.

NEW DEPARTURE

Motorcycle Specialties

INTERNAL EXPANDING BAND COASTER BRAKE

The internal expanding band type, employing exactly the same principle as the emergency brake in the automobile. It operates against the forward movement of the wheel, hence, cannot lock, wind or bind. Riders prefer it because of its superior efficiency, reliability and strength. It is built for service beyond extreme requirements of riding. The 1912 model is absolutely the last word in a coasting and braking device for motorcycles of modern type.

"KNOCK-OUT" AXLE HUBS FOR FRONT WHEELS

The ideal front hub, constructed entirely of specially treated steel and giving maximum strength and wear. The axle is in a sheath and can be removed instantly without disturbing the adjustment or removing any other part of the hub. It runs on eighteen $\frac{1}{4}$ -inch steel balls and is highly finished throughout. Motorcycle dealers and repairers should stock this hub. It has behind it the New Departure guarantee.

SUPERIOR BALL BEARINGS

New Departure ball bearings are an American product of guaranteed merit and offer advantages over the foreign-made bearings in price and other considerations. This bearing is made in standard sizes and can be used to replace any single row bearing of standard bore, diameter and width. Automobile garages and motorcycle repair depots should stock this bearing and save money.

The *Neverout* Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

Our Progressive Platform

1913 is some distance away, but we are getting ready for it now, and we don't need a telescope to see that it will be the best year yet.

Between ourselves, the 1913 SEA LION and WHITE STRIP Belts are wonders. We have watched the 1912 belts all the year and where we found opportunity for improvements, they have been made.

We could take up a lot of space telling you WHY SEA LION and WHITE STRIP Belts are the best, but you want proofs. Ask any one of the big motorcycle manufacturers, Harley-Davidson Motor Co., for instance (and you know they use only SEA LION), and see what they say. They know, if anyone does.

Our policy of co-operation with our dealers has met with such success this year, that we are going to expand that policy and want every 1913 dealer to get in touch with us. It will mean bigger profits for you, and your success is our success.

TO THE
POINT**

THE BREAKER STRIP

in the

Diamond

29" x 3" Motorcycle Tire—and the only motorcycle tire that has a breaker strip.

That breaker strip is the point. A point that no motorcycle rider can afford to overlook.

It means increased mileage, lower tire expense, and vastly increases the easy riding qualities of your machine.

It automatically takes care of overloading. It distributes shocks over a wide area instead of confining them to one spot and thus causing a fabric break and subsequent blowout.

Write for booklet.

Before

After

**J-D Visible
Cured
This Man**

DIAGNOSIS—Ignition Trouble

PRESCRIPTION—One set J-D Visible Spark Plugs

FEE—\$1.00 per plug—money back if not absolutely satisfied

We can cure your Ignition troubles, too. The new principle embodied in the J-D VISIBLE GAP SPARK PLUG enables you to locate and cure Ignition trouble at a single glance.

One look tells everything

Through the port in the porcelain—outside the motor—you see if the spark is jumping the gap in the central electrode. If the spark jumps, but proper ignition fails to follow, then the plug must be foul or the carburetion faulty. If the spark does not jump, then trouble lies behind in magneto or wiring or coil or batteries. Knurled adjusting nut allows you to widen or close gap. Opened, it intensifies spark and cleans point automatically. Uses minimum current, makes timing of engine easy, and permits regulating of spark in any cylinder.

If your dealer has not yet put the J-D VISIBLE PLUG in stock, we will mail you as many as you want, guaranteed, prepaid on receipt of price—just \$1.00 per plug. Write and tell us the size wanted and make of motor.

JEFFERY - DEWITT COMPANY

555 Butler Avenue, Detroit, Mich.

**Here's the Wake-'em-up Siren!**

The Acme Siren demands instant action—not only on the part of the man who hears it and "steps lively"—but also the dealer who wants to stock an article that sells on sight and means repeat orders—always. Our catalog will be sent on request.

**Have You Had Trouble With Your Tires?**

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1896.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

THE *Indian* MOTORCYCLE

PRESIDENT'S ANNOUNCEMENT

YOU ARE HANDED HEREWITH THE ADVANCE catalogue of the Indian Motorcycle for 1913—which is by far the most important document of its kind ever issued in the industry.

Yet, full as it is of details of fresh practical achievements, and conclusive records of flawless past performance, I could not be satisfied, as president of this company, to have it go without a preface touching upon the personal, the sentimental side if you will, of the splendid success in which we are associated.

Our success has been great. Year after year we have led. The great majority of motorcyclists are our fast patrons, because we have given overwhelmingly the best value, the best service in motorcycle improvement.

Every time we have sold an Indian we have made a lasting friend. And it is this we most congratulate ourselves upon.

We have dealt cleanly and fairly with our motorcycle purchasers, with ourselves among ourselves, and with our competitors. I do not believe there is a business on earth in which a finer spirit and feeling exists than among the makers, the agents and the riders of Indian Motorcycles. Verily, we are a great, grand tribe.

And now, on the threshold of the new year 1913, with a record breaking season before us—a minimum of 35,000 machines equipped with the crowning feature of all motorcycle improvements, the Cradle Spring Frame—we can continue to measure our success, not by the commercial standard alone, but by the tremendously widened circle of friendship and mutual respect to which our achievements and our business habits entitle us.

To me, and to all of us, it is not so great a thing to make and to sell 35,000 Indians for the coming year, as it is to know that for every purchaser the value received will be greater than ever before.

I commend you to the following pages.

With best wishes,

Geo. M. Hendee

President

The Indian Motorcycle for 1913

IN ANNOUNCING the new models of the INDIAN MOTORCYCLE for the 1913 season, a brief review of the exploits of this famous machine during the past year and its ever widening field of use will be of practical interest.

Records

Today the INDIAN holds every speed record officially accepted by the Federation of American Motorcyclists, besides numerous other contests and championships held under the auspices of that body. The INDIAN carried off the classic motorcycle event of England last year, the Tourist Trophy Endurance Contest, and this year the classic of France, the Grand Prix. "300 miles in under 300 minutes" was another INDIAN achievement in England this year.

Practical Utility

The INDIAN is more and more becoming recognized as the motorcycle of practical efficiency, entirely apart from its popularity as the tourist's motorcycle and its prowess on the track. Municipal bodies equip their police squads with it. Gas companies, telephone companies, railroad and rural postal delivery men have come to regard the INDIAN as the most practical, reliable and economical motorcycle for use in the accomplishment of their respective duties.

The Hedstrom Motor

1912 has further demonstrated the well known efficiency of the Hedstrom motor, used on all INDIAN MOTORCYCLES. It is universally recognized as one of the most powerful, flexible and reliable motors in the world. Not only has it conclusively proven its remarkable capacity for speed, but for hill climbing, long distance and endurance runs the Hedstrom motor has established a reputation second to none in the gas engine field. On rough roads, mountainous country and in all conditions of weather the Hedstrom motor sustains a reliable and steady level of efficiency. The rider is always assured of plenty of reserve power, which he can call upon at will when encountering steep hills and strong head winds. In the 1913 INDIANS the motor connecting rod is fitted with roller bearings. No other improvement in the Hedstrom motor was possible or necessary.

The Factory

In order to facilitate the production of our 1913 models, we have enlarged our factory. The modest plant of ten years ago has gone on increasing in capacity with the growth of the INDIAN'S fame and popularity. Now the plant consists of four buildings, with a storehouse capable of holding five thousand crated motorcycles.

The INDIAN factory now covers over seven and a half acres of floor space and is equipped with the most modern machinery, some pieces of which are our own

original design and are marvels of labor-saving ingenuity. It is estimated that when in full operation the capacity of the INDIAN factory will be a complete motorcycle every three minutes of the working day.

Improvements in the 1913 Indian

The outstanding feature of the 1913 INDIAN is the CRADLE SPRING FRAME, fitted to all models. This is the most revolutionary and epoch making departure from established systems of motorcycle spring devices. Nothing like it has ever before been attempted. Eighteen months of severe test and experimentation by our engineering department was devoted to the perfecting of this new device.

The CRADLE SPRING FRAME is, briefly, the application to the rear of the machine of the spring principle which has proved so successful during the past three years in connection with the front fork.

Extending back horizontally from the frame-joint cluster below the saddle, flanking the rear mud guard, are two seven-leaf Chrome Vanadium steel springs. The "C" shaped curls at the rear end of these springs are connected by stays to bell-cranks on which the rear axle is hung. The forward end of the rear fork has a hinge joint which enables the wheel to yield to imperfections of road surface. All shocks are completely absorbed by the leaf springs. The rear wheel can go through almost any vertical motion without affecting the body of the machine. There is no "bottom" to this spring device.

On the roughest road the rider is conscious only of the smooth, forward gliding motion. The lightest or heaviest rider feels no jar and the life of the machine is greatly increased. The INDIAN MOTORCYCLE is now leafspring fore and aft. This marks the first departure from the inefficient spiral spring system of yesterday.

In addition to the CRADLE SPRING FRAME, the 1913 INDIAN embodies ten other important improvements which will be appreciated by all riders.

New Style Rims—Single Clinch type, permitting the use of either $2\frac{3}{4}$ inch or 3 inch tires.

Larger Tires—All 1913 INDIANS are equipped with $2\frac{3}{4}$ inch tires as against the $2\frac{1}{2}$ inch tires of 1912. The widening of forks both fore and aft also allows ample clearance for the use of anti-skid chains in addition to the larger tires.

Wider Mud Guards—With splashers to correspond, affording complete protection in riding through oil or muddy roads.

Rear Chain Guard—Covering upper stretch of long chain, giving perfect protection to chain, sprocket and band brake.

Luggage Carrier—New type with tool bag at rear, fitted to all 1913 INDIAN models without extra charge. Advantageous for commercial, tourist or general use.

Foot Boards—Fitted to regular 4 H. P. and 7 H. P. INDIANS for 1913 in addition to pedals. This feature gives the rider a choice of two comfortable riding positions with complete control of the machine assured in each instance.

Foot Brake Lever—A lever close to the left foot rest, now operating Corbin improved band brake with same action as pedals.

Multiple Disc Clutch—Large size, as used on last year's 7 H. P. INDIANS, now fitted to all 1913 models.

Saddle—Improved INDIAN-Mesinger type, affording the rider a lower and more comfortable position.

Note—All INDIAN models for 1913 will be chain drive. No belt driven machines will be made. All 1913 models will be finished in Indian red.

The 1913 7 H. P. Twin-Cylinder Indian

The rider who is familiar with the basic essentials in what he regards as a motorcycle of the first rank will find the 1913 INDIAN "Twin" as complete and satisfying as the most exacting demands could require.

First, the primary essentials of Power, Speed, Comfort, Reliability and Ease of Control are positively superb in each instance. These things should be found in every motorcycle worthy of recognition. Then come those numerous little refinements which lift the INDIAN "Twin" out of the ranks of the merely adequate and place it in the very forefront of the elect. In the 1913 model not the smallest opportunity has been overlooked to increase the comfort and convenience of the rider and to further elevate the machine towards the pinnacle of mechanical perfection. With truth we can claim that the INDIAN "Twin" is almost automatic in its operation. Can be run as slow as two miles an hour in traffic. The rider has very little "driving" to do. In fact his efforts are practically confined to control, which in the INDIAN is instantaneous and positive. The novice will find the INDIAN "Twin" perfectly within his natural powers of management. To anybody who has ever ridden a bicycle, the INDIAN "Twin" presents no problems of operation. A few minutes instruction in the general principles of the motor and transmission and a little practice in working the simple control devices—that's all. Earnestly recommended as the most satisfactory all-around motorcycle model on the market.

Details of the INDIAN "Twin" will be found elsewhere in these pages.

Tourist Trophy Two-Speed Models

For 1913 the Tourist Trophy models will be built in both the 4 H. P. single and 7 H. P. twin cylinder sizes as last year, but both will be fitted with the two-speed gear.

The striking characteristic of the T. T. machines is that they are provided with a foot starting device which is a model of convenience and ingenuity, and enables the rider to start his machine by a light kick of the foot upon a lever.

A very powerful double brake is fitted to the T. T. models. This is operated by a foot lever on the right side of the machine and also by a grip lever on the left handle bar. The double action consists of expansion and contraction of two bands, inside and outside a brake drum.

Another valuable feature of this model is the improved rear hub. This is of extra large size, and runs on improved ball bearings which are absolutely frictionless. In both front and rear hubs a knockout axle is used, which enables the wheels to be removed without interfering with the adjustment of the bearings.

The T. T. models have no pedals, but are provided with comfortable foot boards upon which to rest the feet. These foot boards are hinged so they can be folded up out of the way to economize space in storing.

The T. T. Two-Speed INDIAN embodies every refined detail in motorcycle construction and forecasts the motorcycle of the future. It appeals to those who want only the very pinnacle of motorcycle perfection. With the new Cradle Spring Frame, the 1913 T. T. is positively the last word in motorcycle design. There are at present over 3,000 T. T. INDIANS on the road.

Output

Of the 1912 model, 19,750 INDIANS have been made, sold and delivered and are now on the road. Although we thought we had anticipated the INDIAN demand for 1912, we were compelled to disappoint thousands who failed to order in time. For 1913, we will produce 35,000 machines. This figure we hope will meet the demand for the coming year.

New Branch in the South

A new distributing and service branch of The Hendee Mfg. Co., has been opened in Atlanta, Ga., for the benefit of the Southern trade. This branch will cover the territories of Georgia, Florida, North and South Carolina, Alabama, Mississippi and Tennessee. The needs of Southern riders of the INDIAN can thus be catered to more readily. Complete stock of parts for all INDIAN models, new and old, will be at the service of INDIAN riders.

THE HENDEE MANUFACTURING COMPANY

(Largest Motorcycle Manufacturers in the World)

SPRINGFIELD, MASS.

Chicago: 1251 Michigan Avenue
Denver: 138 Sixteenth Street

London: 184 Gt. Portland Street

San Francisco: 234 Van Ness Avenue
Atlanta: 457 Peachtree Street

SPECIFICATIONS

4 H. P. Single Cylinder 30.50. Regular Model - - - - \$200.00 f. o. b. Factory

Motor—Hedstrom, air cooled (4 h. p.), bore $3\frac{1}{4}$ inch, stroke 3.43-64 inch, piston displacement 30.50 cubic inches.

Carburetor—Hedstrom improved, automatic, compensating, with auxiliary jet.

Valves—Both inlet and exhaust mechanically operated and constructed of the best alloys suitable for the purpose.

Ignition—Improved high tension enclosed magneto.

Spark Plug—Hedstrom Mica.

Muffler—Indian latest improved with tail pipe. Quiet and efficient.

Lubrication—Automatic, constant, positive feed, by mechanically operated pump. Hand operated pump also fitted for emergency.

Oil Gauge—Direct sight, opening to improved reservoir in base.

Handle Bars—Graceful in design, and fitted with "Rough Rider" grips.

Control—Indian patented leverless, double grip "twist-of-the-wrist" system.

Transmission—Roller chain drive, Indian improved. Free engine clutch. Drive chains and sprockets, efficiently protected by guards. Pedaling gear, 50 inches. Drive gear $5\frac{1}{2}$ to 1. Options. Chain $\frac{1}{4}$ inch, roller $\frac{3}{8}$ inch pitch.

Tanks—Gasoline capacity, $2\frac{1}{2}$ gallons. Improved sure-tight gasoline cut-off built into tank. Cap fitted with priming syringe. Oil capacity 2 quarts.

Frame—Indian Cradle Spring Frame. Indian patented bridged reinforcement throughout, scientifically braced and fitted with luxurious twin springs of highly tempered chrome vanadium steel. Height $18\frac{1}{4}$ inches.

Fork—Indian Cradle Spring Fork, scientifically braced and with long luxurious spring of highly tempered chrome vanadium steel. Fork crown, drop forgings.

Wheel Base—55 inches.

Wheels—28 inch diameter, 36 inch spokes front and rear. Rims heavy single clinch. Finished to match frame. Heavy spokes.

Guards—Improved beaded mud guards, front and rear, with front extension and splashers to correspond. 4 7-16 inches wide.

Tires—United States studded, single clinch, 28 inches by $2\frac{3}{4}$ inches detachable.

Brake—Improved Corbin Coaster Band Brake operated either by back pedaling or from brake lever on foot board.

Stand—A substantial folding stand fitted on all models.

Saddle—Improved Indian Mesinger, allowing a very low saddle position.

Finish—Indian red, all bright parts nicked over heavy coat of copper.

Tool Box—Large leather tool box attached to rear of luggage carrier containing complete set of tools, and repair outfit.

Luggage Carrier—Heavily constructed. Neat in design. Finished to match frame.

Foot Boards—Hinged construction to permit folding up.

SPECIFICATIONS

7 H. P. Twin-Cylinder 61. Regular Model \$250.00 f. o. b. Factory

Motor—Hedstrom improved, air cooled (7 h. p.), bore $3\frac{1}{4}$ inches, stroke 3 43-64 inches, piston displacement 61 cubic inches.

Carburetor—Hedstrom improved, automatic, compensating, with auxiliary jet.

Valves—Both inlet and exhaust mechanically operated and constructed of the best alloys suitable for the purpose.

Ignition—Improved high tension enclosed magneto.

Spark Plug—Hedstrom Mica.

Muffler—Indian latest improved with tail pipe. Quiet and efficient.

Lubrication—Automatic, constant, positive feed, by mechanically operated pump. Hand operated pump also fitted for emergency.

Oil Gauge—Direct sight, opening to improved reservoir in base.

Handle Bars—Graceful in design, and fitted with "Rough Rider" grips.

Control—Indian patented leverless, double grip "twist-of-the-wrist" system.

Transmission—Roller chain drive, Indian improved. Free engine clutch. Drive chains and sprockets efficiently protected by guards. Pedaling gear, 50 inches. Drive gear 4 to 1. Options. Chain $\frac{1}{4}$ inch, roller $\frac{1}{8}$ inch pitch.

Tanks—Gasoline capacity, $2\frac{1}{2}$ gallons. Improved sure-tight gasoline cut-off built into tank. Cap fitted with priming syringe. Oil capacity 2 quarts.

Frame—Indian Cradle Spring Frame, Indian patented bridged reinforcement throughout, scientifically braced and fitted with luxurious twin springs of highly tempered chrome vanadium steel. Height $18\frac{1}{4}$ inches.

Fork—Indian Cradle Spring Fork, scientifically braced, and with long luxurious spring of highly tempered chrome vanadium steel. Fork crown, drop forgings.

Wheel Base—55 inches.

Wheels—28 inch diameter, 36 inch spokes front and rear. Rims heavy single clinch. Finished to match frame. Heavy spokes.

Guards—Improved beaded mud guards, front and rear, with front extension and splashes to correspond, 4 7-16 wide.

Tires—United States studded, single clinch, 28 inches by $2\frac{1}{4}$ inches detachable.

Brake—Improved Corbin Coaster Band Brake operated either by back pedaling or from brake lever on foot-board.

Stand—A substantial folding stand fitted on all models.

Saddle—Improved Indian Mesinger, allowing very low saddle position.

Finish—Indian red, all bright parts nicked over heavy coat of copper.

Tool Box—Large leather tool box attached to rear of luggage carrier containing complete set of tools, and repair outfit.

Luggage Carrier—Heavily constructed. Neat in design. Finished to match frame.

Foot Boards—Hinged construction to permit folding up.

SPECIFICATIONS

4 H. P. Single Cylinder 30.50. T. T. Two-Speed Model - - \$275.00 f. o. b. Factory

Motor—Hedstrom improved, air cooled (4 h. p.), bore $3\frac{1}{4}$ inches, stroke 3 43-64 inches, piston displacement 30.50 cubic inches.

Carburetor—Hedstrom improved, automatic, compensating with auxiliary jet.

Valves—Both inlet and exhaust mechanically operated and constructed of the best alloys suitable for the purpose.

Ignition—Improved high tension enclosed magneto.

Spark Plug—Hedstrom Mica.

Muffler—Indian latest improved with tail pipe. Quiet and efficient.

Lubrication—Automatic, constant, positive feed, by mechanically operated pump. Hand operated pump also fitted for emergency.

Oil Gauge—Direct sight, opening to improved reservoir in base.

Handle Bars—Graceful in design, and fitted with "Rough Rider" grips and magneto cut-out.

Control—Indian patented leverless, double grip "twist-of-the-wrist" system. 2-speed control operated by small lever mounted on top bar of the frame convenient to the right hand of the rider.

Transmission—Roller chain drive, Indian improved. Free engine clutch 2-speed gear. Drive chains and sprockets efficiently protected by guards. Drive gear 5 to 1. Options. Chain $\frac{1}{4}$ inch, roller $\frac{5}{8}$ inch pitch. The Indian 2-speed gear provides for a reduction of 40% between the direct drive and low speed.

Tanks—Gasoline capacity $2\frac{1}{2}$ gallons. Improved sure tight gasoline cut-off built into tank. Cap fitted with priming syringe. Oil capacity 2 quarts.

Frame—Indian Cradle Spring Frame. Indian patented bridged reinforcement throughout, scientifically braced and fitted with luxurious twin springs of highly tempered chrome vanadium steel. Height, $17\frac{3}{4}$ inches.

Fork—Indian Cradle Spring Fork, scientifically braced and with long luxurious spring of highly tempered chrome vanadium steel. Fork crown, drop forgings.

Wheel Base—58 inches.

Wheels—28 inch diameter, 36 inch spokes front and rear. Rims heavy single clinch. Finished to match frame. Heavy spokes. Improved rear hub of extra large size running on improved frictionless ball bearings. Front and rear hub provided with knock-out axle enabling the wheels to be removed without interfering with the adjustment of the bearings.

Guards—Improved beaded mud guards, front and rear, with front extension and splashers to correspond, 4 7-16 inches wide.

Tires—United States studded, single clinch 28 inches by $2\frac{3}{4}$ inches detachable.

Brake—Improved double brake with internal brake bands expanding within a brake drum and operated by a foot lever conveniently placed. Also a second brake band which contracts on the outer circumference of the same brake drum and is operated by a grip lever on the left handle bar. These brakes are more powerful than any other and are so absolutely simple that there is nothing to get out of order.

Stand—A substantial folding stand fitted on all models.

Saddle—Improved Indian Mesinger, allowing very low saddle position. Option No. 4 or No. 5 Cavalry.

Finish—Indian red, all bright parts nicked over heavy coat of copper.

Tool Box—Large leather tool box attached to rear of luggage carrier containing complete set of tools and repair outfit.

Luggage Carrier—Heavily constructed. Neat in design. Finished to match frame.

Foot Boards—Hinged construction to permit folding up.

MOTORCYCLISTS: To insure CONTROL and avoid accidents—insist that your machine be equipped with the

CORBIN Motorcycle Band Brake

¶ The 1913 model of this famous braking device—the original motorcycle brake—is the simplest, strongest and most reliable brake any motorcycle can require, however powerful. Adaptable to all makes.

¶ An improvement for 1913 is the nut lock formed by two projections on one end of the band. Prevents the nut turning or jarring loose. A further improvement is a bracket attached to the lower side of the brake arm. Keeps the band from dragging on the drum or sagging when expanded. Also prevents loss of power or overheating.

¶ Be on the safe side. About 50% of all motorcycles made today are Corbin equipped. Insist on the Corbin Band Brake for *your* motorcycle.

Write for new 1913 catalogue showing all Corbin brakes and hubs for bicycles and motorcycles.

Did You Ever Ride on an *Eagle*?

That's the real test. It's the nearest thing there is to flying.

Dealers:

Don't forget that cylinder capacity is the basis of power, and the efficiency of the cylinder capacity depends on clearance space over the piston, ports, cam action, carbureter and inlet pipe capacity, lightness of reciprocating parts, fit of piston and rings, lack of internal friction, its capacity to eat, digest and get rid of gas.

The Eagle just bristles with these points. The whole combination of size and high efficiency produces a motor that is able to twist the rear wheel so fast that the trees, side of the road, look like a

high fence, and say, you simply can't let the throttle stay open. She's too high spirited for that kind of running. And too, Bosch, Eclipse, Mesinger, Standard Welding and others of the high class accessory manufacturers help to make the Eagle.

Show the Eagle to a buyer. Just show it. Don't say a word. Let the Eagle do the talking. You'll be surprised how convincing that dumb show will be. The Eagle speaks for itself.

Get the agency and see.

BOSCH PLUGS

**As good as
Bosch Magnetos**

Enlarged view of the Bosch Plug

An end view, showing the three
crescent-shaped electrodes

THE Bosch Motorcycle Spark Plugs differ in every respect from other motorcycle plugs that you have used. They are free from the usual imperfections of design and material; though neat in appearance, their very substantial construction makes for a spark plug which not only withstands the trying conditions of motorcycling but at all times gives maximum results with minimum attention.

The Bosch Plug is absolutely gas-tight; there are no threaded nuts used in its construction. The insulating material is Steatite, an indestructible artificial stone with positive and exceptional insulating properties. Steatite is neither brittle nor subject to deterioration from intense heat or excessive use of oil.

Do not accept moderate power results—maximum efficiency can be obtained at all times by using Bosch Plugs; they complete the perfect ignition system—

**The Bosch Magneto

THE BAXTER SIDE-CAR

Ten years of side-car manufacturing experience has qualified us to state authoritatively that the Baxter side-car is fit to cope with any and all road conditions in America.

Its chassis of seamless steel tubing, double truss frame construction and rigid mud-guard give it enormous stability.

Yet so scientifically is the weight distributed that it is the lightest frame on the market. Then, too, the hub spindles, the most vulnerable points on a side-car, are turned from solid Bessemer steel.

Comfort is assured by its tension spring absolutely absorbing all shocks, its deeply upholstered basket of India rattan and its popular English shape.

NOTE.—We make baskets to specifications. All parts quick-detachable and furnished separately if desired.

**Model
No. 2**

**With Side Entrance

ECONOMY

In buying a motorcycle, economy of upkeep should be taken into serious consideration. Repairs and replacements are costly and often result in an ultimate expense that may be far greater than anticipated.

That transmission has an important bearing on the expenses of upkeep is a well-known fact.

Our contention is that the belt, especially the "Spartan" belt, is not only more economical than

other forms of transmission, but that it is the only logical and practical transmission for giving satisfactory service.

We will confine this talk to a comparison of the belt and chain from the standpoint of economy, emphasizing replacements and mileage. In the succeeding "G & K" Belt Talks, other points of comparison will be taken up.

Comparative Facts

Misalignments are common and frequent to all forms of transmission.

With a V-belt, for example, any slight misalignment does not cause appreciable wear nor loss of transmission efficiency. The belt, whether "V" or flat, wears and not the pulleys. The latter frequently outlasts three to five belts before affecting the efficiency of the drive. When a belt is unserviceable, a new one can be fitted and the transmission will be just as efficient as before.

With a chain transmission, on the other hand, a defective alignment means that the chain or sprockets or both will wear improperly and their life will thus be reduced. When a chain or its sprockets are worn, the remedy is renewal of both, otherwise the efficiency of the drive is materially reduced, for a new chain will not work well on worn sprockets nor will an old chain work well on new sprockets.

Belt transmission being flexible absorbs the road shocks and is thus easier on the power-plant and frame. A non-flexible drive transmits these shocks throughout the entire machine.

Shocks from quick starting and other overload causes result in putting the driving wheel out of round; this necessitates the expense of rebuilding it eventually. Keys are sheared, threads stripped and bearings (either ball, roller or bronze) are damaged by these shocks. The slip of the belt under abnormal conditions prevents these shocks and the results mentioned are comparatively rare, in the case of belt-driven machines.

An examination of the running gear of machines other than belt driven will show a majority of frames out of line due to the excessive strain of the harsher form of drive. It costs something to have a frame straightened, and it does not improve the running of the machine, as a frame once put out of line can rarely be gotten back again perfectly. When the frame is out of line the wear of tires, bearings and transmission will be uneven.

It will be seen from the facts enumerated that by reason of the reduced number of costly replacement charges and the greater mileage under similar riding conditions, the belt is the most economical in comparison with other forms of transmission.

Spartan Belts

are foremost in mileage and efficiency. That's why 80% of the manufacturers of belt drive motorcycles use them.

A Word to Dealers

Honest and business-building dealers sell a customer not always what he thinks he wants, but what he needs—even though they may thus sacrifice a large immediate profit and a future harvest from repair bills. By honest service, dealers have secured the purchasers who will stick to them for years and bring other customers to them. If a customer needs a motorcycle for professional track work where excessive speed is demanded, he should be sold a chain-driven machine—if he requires a motorcycle for all-around pleasure and sport and little upkeep expense, then unquestionably he should be persuaded to buy a belt-driven machine.

We extend the right hand of fellowship to every honest dealer.

Canadian Dunlop Trophy Contest Another Big Harley-Davidson Victory

997¹/₂
vs.
572

STEVE LICENCE AND ARTHUR OTTLEY, PENALIZED ONLY FOR BEING AHEAD OF SCHEDULE.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

CHAS. RUSSELL AND FRANK RYNEX AND THEIR PERFECT SCORE HARLEY-DAVIDSONS.

FOUR Harley-Davidsons started—all finished—two with perfect scores; the other two were penalized for checking *ahead of schedule*. Twenty other machines started, representing seven different makes. The only perfect score in these twenty was made by a make with six entries, two more entries than the Harley-Davidson had. But the *average* score of these six machines was only $468\frac{5}{8}$ —less than half that of the Harley-Davidson. The grand average of the other seven makes was 572, compared to the Harley-Davidson average of $997\frac{1}{2}$.

Nineteen of the twenty competing riders were unable to equal even the *lowest* Harley-Davidson score. Seven of these had not finished at the time the checking station was officially closed in Toronto at 6:50 P. M.

That the Harley-Davidson motorcycle is dependable under any and all conditions is an acknowledged fact. That it is without an equal at any price is now general knowledge. Overwhelming Harley-Davidson victories like the Canadian Trophy Contest, embracing as it did *the very cream* of the world's *best* makes, have come to be the general order of things and are no longer looked upon as exceptional or phenomenal performances to stir up the entire industry.

Of course, the Harley-Davidson costs more. The best motorcycle designers and engineers in the business are responsible for the Harley-Davidson and good material and skilled labor cannot be had at the same prices as ordinary material and indifferent or inefficient work.

EXPERIENCE TEACHES

During all of these years we have been improving. We have spared no effort to make the Famous EMBLEM of 1908-09-10-11 and succeeding Models better each year, more Speedy, more Serviceable, more Comfortable, more Beautiful. The Sturdy old EMBLEMS of former years are still running, still satisfactory

"Once an Emblem rider always an Emblem rider"

MODELS

Single	Battery or Magneto	Belt Drive
Twin 7	Magneto	Chain Drive
10 H. P.	Magneto	Chain Drive

The addition of a 10 h. model to the Emblem line means that the demand for an exceptionally powerful machine is adequately met. One man who tried out the Big Ten Emblem said: "That machine could climb a telegraph pole!" An exaggeration, but it shows what enormous power the new Emblem has.

SATISFACTION FOR RIDERS MEANS PROFITS FOR DEALERS.
BETTER WIRE FOR YOUR TERRITORY—IT'S GOING FAST.

The Yale Motorcycle is the

ORTIE STEVENS, P. W. Stevens and George Riechey, the Yale riders, won the New Jersey Motorcycle Club's 24-hour endurance run, 325 miles, September 14-15. They won "hands down"—the only team with a perfect score. Besides the big team trophy, a gold medal went to P. W. Stevens, and a silver cup to Riechey as special prizes for the most consistent riding of any of the 28 competitors.

DURING the 1912 season there were just three endurance contests of national scope, in which representative fields were entered with teams of all the big manufacturers riding. These were: the Middletown Club's three-day run from Middletown, O., to Louisville,

Ky., and return, 400 miles, August 31, September 1, 2; the 24-hour endurance grind of the New Jersey Motorcycle Club, over 325 miles of hills, sand and mud, September 14-15; and the three-day contest of the Ohio State F. A. M., Toledo to Cincinnati over a circuitous course of 573 miles, October 11, 12, 13.

In each of these the Yale won decisively, with its team the *only* one to come through to the finish with all its riders still in the running. In every case the three Yale riders were going as steadily at the finish as at the start, and on time to the dot. In each case the Yale won decisively—there was no chance for another machine to claim a "best showing" even by juggling figures or making

National Road Champion

excuses. The Yale succeeded where the others simply could not "deliver the goods" and the score sheets told the story.

The best machine for road riding is the one the average rider wants. He wants to be able to "give the dust" to the other

THE Tri-State endurance run of the Middletown Motorcycle Club (Middletown, O., to Louisville, Ky., and return, August 31, September 1 and 2) was another decisive Yale victory. Squier, Meyer and Campbell, the Yale team, were the only team to bring all riders through with perfect scores. The machines ran steadily as clockwork, unaffected by the terrific heat, bad roads and mechanical troubles that put so many others out of the running. Campbell's left hand was put out of commission by a fall caused by hitting a dog, but his never-failing Yale carried him to victory steered by one hand.

THE three-day endurance contest of the Ohio F. A. M. (Toledo to Cincinnati, 600 miles, Oct. 11, 12, 13) is still fresh in the minds of all riders. It was another decisive Yale victory, for while no other team had more than one rider finish—with any kind of score—all three Yale men were in on time at Cincinnati. Squier and Jacobs had perfect scores, and Campbell had 996, delay by a Cleveland traffic policeman having cost four points.

fellow, and with a Yale he can always lead on the road.

The Yale is the fastest road machine made, bar none, for all conditions; for the motor not only possesses superior power and more "pepper," but the balance and steering qualities are so perfect that the machine can be handled at speed where any other is unmanageable.

Some Refinements Made in the 1913 R-S

CLUTCH ON CHAIN MODELS—Cork inserts have been added to Cone Clutch, which give 50% more pulling power and make it fool-proof.

VALVE MECHANISM—Intake and exhaust cams are integral with timing gear, constructed of one-piece vanadium steel, undercut for long bearings. This assures accurate timing. We were the first to adopt this feature in 1912 and hold patents covering same. We are the leaders, others are following.

ECLIPSE CLUTCH ON BELT MODELS—Corbin Eclipse or New Departure Coaster Brake—Bosch Magneto—Troxel Saddle—Schebler Carbureter.

THE COMMON RESULT OF STANDARDIZATION

The R-S is the only machine on the market that has not undergone a noticeable change in design for 1913. Why? Because, secure in its established station as "The Finest Motorcycle in the World," it needs no bolstering with so-called "improvements" to hold its enviable position.

DEALERS—THINK THIS OVER

Reading-Standard Co.

CLARK MOTORCYCLE STARTER

A neat and compact attachment for the carburetor, that starts the engine without excessive pedaling, reduces carburetor trouble fifty per cent and cuts down the gasoline bill. A gasoline engine requires a richer mixture to start on than is needed after it is warmed up. Without the Clark Starter, it is necessary to open the needle valve more than is required to give efficient results after engine is warmed up.

Price 75c.

W. F. Clark Mfg. Co.

3551 W. 23rd St.
Chicago, Ill.

To start engine, turn starter handle to right, which shuts off the auxiliary air, crank engine once and engine will start instantly. As soon as the engine warms up, turn starter handle to original position, which re-opens auxiliary air; if desired to give a richer mixture, without stopping to adjust carburetor, turn starter handle to right until desired mixture is obtained.

How Far Can You See at Night?

Do you slowly creep along—seeing a few feet ahead of you, by means of a feeble oil lamp or small carbide generator—or do you ride along at a good speed with a flood of Prest-O-Lite brilliancy telling you of coming ruts and puddles IN PLENTY OF TIME to avoid them?

The pleasure of night riding is made possible **ONLY** by Prest-O-Lite—the practical light for motorcycles.

Turn on just like a gas jet and touch a match. Convenient, clean, dependable. Nothing to freeze in cold weather.

Gives you a steady flood of bright light that neither flares up nor dies down. Insures yourself and your mount against accidents. It is, in every way, the only economical kind of light.

Prest-O-Lite Owners

"Presto—Best by Test," says S. Karl Hovland, of Bowbells, North Dakota, who uses Prest-O-Lite on his "Yale 7."

Prest-O-Lite Motorcycle Gas Tank

Exchange service practically everywhere has been provided for you through our 20,000 dealers (automobile and motorcycle).

NOT AT ALL Expensive

Any rider who has used Prest-O-Lite will tell you that the operating expense of it is no greater than the cost of the carbide a generator consumes.

The first cost of the tank, \$10, does not represent money spent, but **INVESTED**, because the genuine Prest-O-Lite Tank is always in demand and is always saleable for about its first cost.

Therefore you can easily afford it—in fact you cannot afford to be without this combined Convenience, Pleasure and Insurance. One accident due to poor light may cost you more than years of Prest-O-Lite service.

Price of Tank \$10

(Equipped with gauge.)

Dimensions: Length, 13¼ inches; diameter, 4 inches; weight, 8¾ pounds.

Don't Let Anyone Cheat You With An Imitation

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one, ANYWHERE and ALWAYS. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

The Prest-O-Lite Company 246 East South St.
INDIANAPOLIS, IND.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Mr. Dealer: Get into the habit of talking to your customer about Prest-O-Lite. A simple statement of the facts about this light will make sales.

And, if you want to retain your customer's trade on other things, don't get him into the habit of going elsewhere for his Prest-O-Lite exchange.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment; we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

PROMINENT MOTORCYCLE MANUFACTURER HAS
SELECTED AS EQUIPMENT FOR NEXT SEASON

UNITED STATES MOTORCYCLE TIRES

**UNITED
STATES
TIRES
ARE THE
STRONGEST
TIRES
IN THE
WORLD**

THE EXCELSIOR MOTOR MANUFACTURING AND SUPPLY COMPANY, of Chicago, has contracted with us to supply a large percentage of the tires to be furnished as regular equipment next year on the popular EXCELSIOR MOTORCYCLES.

Manufacturers, as well as tire users, are learning more and more every day that there is a vast difference between the character of service rendered by tires that are four-factory-made and four-factory-tested and those produced under manifestly less advantageous conditions.

They have proven to their own satisfaction that the extra strength and durability which have come from uniting in one brand of tires all the strong points of two famous makes, actually adds strength and durability to their machines.

United States Motorcycle Tires are always economical tires to use.

And they cost no more than you are asked to pay for other kinds.

OCTOBER 31, 1912

MORE SHOW SPACE NEEDED IN CHICAGO

Original Contract Was For 13,000 Square Feet But This Section Has Now Been Increased to 17,900 Square Feet, and Applications Are on File Covering the Entire Area.

MANAGER J. S. VOGEL, of the independent Chicago motorcycle show, announces that it has been necessary to contract for 4,900 square feet of extra space in order to accommodate the exhibitors who have already entered applications, and the total area of the show space will now be about 18,000 square feet. The original contract was for 13,000 square feet, but it was soon realized that this would fall far short of meeting the requirements, and at the meeting of the Motorcycle Manufacturers' Association in Chicago on October 9 negotiations were opened for more room in the show building.

When it is known that the last motorcycle show in Chicago occupied only 3,500 square feet of floor space, a fair idea will be gained of the scale on which the present plans are being developed.

For a short time it was rumored that the members of the Motor and Accessory Manufacturers' Association would be prohibited from exhibiting because of a by-law which stipulates that members of the body are forbidden to exhibit at a show not sanctioned by the association, but assurances have been

received that the motorcycle show will be officially recognized. Statements to this effect have been given out by the Executive Committee, as well as by William M. Sweet, who is the show manager for the Accessory Manufacturers' Association.

Contract blanks for motorcycle exhibitors will be mailed as soon as the allotments have been made by the Show Committee, which will be early in November. Arrangements will be made whereby dealers from all parts of the country will be admitted without charge during the entire week. All that will be necessary is a signed order from the exhibitor they represent and on presentation of this order they will receive tickets entitling them to admission on each day. The M. M. A. Show Committee and Manager J. S. Vogel will be on hand at all times throughout the show week and every effort will be made to provide for the comfort of visitors.

Despite the fact that all the space contracted for by the show committee is now covered by the applications of exhibitors, Manager Vogel is anxious to hear from those not already represented, as steps may be taken to obtain an option on another addition to the show section.

INDIAN MODELS SHOW NEW SPRING FRAME

Distinctive Leaf-Spring System Features Rear Construction of Wigwam Products for 1913 and Other Improvements Are Numerous—Retinements in Motor, Larger Muffler with No Cut-Out, Guarded Transmission, Simple Braking, Wider Forks and Footboards on All Four Types.

TRIED products do not usually undergo marked changes from season to season, but an exception to this rule is the 1913 line of the Hendee Manufacturing Company, in which a radical departure from accepted motorcycle construction has been made; this is in the adoption of a spring frame in which vanadium steel coach or "cradle" springs are employed. As far as the use of this form of spring is concerned, the Hendee company is the pioneer, having had this spring type in its front fork for a number of seasons, but its application to a frame system is an altogether new arrangement for the wigwam designers.

Larger Tires.—Comfort and efficiency are further increased by the use of larger rims and tires, $2\frac{3}{4}$ -inch sizes of the latter being fitted to all but the 7-horsepower, two-speed models, which have 3-inch tires as standard equipment. Another feature, which appeals to all-weather riders in particular, is the increased clearance between the tires and mudguards, so that tire chains can be fitted without striking the guards or contiguous parts. The transmission is entirely guarded from mud and dirt, and as a result the rider will also keep clean. Footboards are fitted to all models, and riders will have a choice of position, with an assurance of safety in having the brakes instantly under control by merely a movement of the foot, regardless of whether the feet are on the pedals or footboards. The whole control system tends toward that used on automobiles, a combination of hand and foot.

Refinements.—Other changes are in the line of refinement also. The foot-starter has a rubber-covered swinging foot-pin, which is out of the way until turned into position for use. The muffler is increased in capacity, and a luggage-carrier and accessibly-hung rear tool box are standard equipment. The big-end of the connecting rod is fitted with roller bearings and the transmission side bearing is increased in length. A Superba Mesinger saddle is supplied on all four models.

The Four Types.—Four models only will be manufactured for the 1913 season. These are the 4 h. regular model, priced at \$200; 7 h.

4 h. Model Without Two-Speed.

regular model, \$250; 4 h. two-speed model, \$275; and 7 h. two-speed model, \$325. The belt-drive 4 single is discontinued, as are also the Tourist Trophy machines. Only one color—Indian red—will be used, and United States tires only will be fitted.

Showing Clutch Lever on Two-Speed Model.

Showing Brake Lever as Fitted on Regular Model.

Motor.—For 1913 the Indian motor is unchanged in bore and stroke dimensions, but the bearing on the transmission side is made

longer to accommodate the new chain line. This and the other main bearing are of bronze, as in previous construction, but the big-end of the connecting rod has a roller-bearing fitted, eleven cylindrical rollers being used. On the twin models the forked big-end has a reinforcing piece across the end, thus doing away with any possibility of the forks spreading or breaking. The employment of a roller-bearing at this point tends to reduce friction and guarantees longer life to both connecting-rod and crank-pin. The left side of the crankcase is slightly wider to accommodate the increased length of the transmission side bearing just mentioned. The flywheels are now drop-forged, and an even mass is secured, thus tending toward more efficient balance. The carbureter, valves and gearing, and ignition system are the same as on the 1912 product, having been found perfectly satisfactory. Lubrication is by mechanical pump as before, with the auxiliary hand pump fitted on the oil tank at the left side. New spark plugs, of Splitdorf make, are fitted on all models.

Muffler.—This fitment has been increased in length an inch and a half, and no cut-out is fitted. The increased volume makes the 1913 Indian unusually quiet-running, while the absence of the cut-out is in line with the gradually increasing disuse of that fixture and consistent with the policy of the F. A. M. The tail-pipe is also changed in form.

Transmission.—The familiar two-chain drive is, of course, continued on all models, but the chain line is now one-quarter of an inch further from the center line, to compensate for the increased clearance at the sides of the rear wheel. Both primary and secondary drives are guarded, the former by a fan-shaped casing with ports for the clutch body, and for the foot-starter sprocket on the two-speed models. The guard over the secondary drive is in the form of a right-angle piece with curved rear end which is attached to the rear fork and luggage-carrier stay, and fits over the upper side of the chain. The guarding thus thoroughly protects the transmis-

4 h. Single Type With T. T. Two-Speed.

7 h. Twin Without Two-Speed.

sion and at the same time keeps the rider clean. On the two-speed models a special steel stamping fastened to the crankcase side protects the ratchet portion of the foot-starter and strengthens it. The front sprocket of the primary drive is further protected by this same stamping, and runs within it.

Clutch and Two-Speed Gear.—On the regular models the clutch is operated by a hand-lever pivoting on a pin at the left side as in previous models, and the pinch collar as used in 1912 operates the plate mechanism. On the two-speed models, the clutch is operated by a through-rod with a rocker on the right side as in the Tourist Trophy two-speed machines, but to this rocker is attached a rod which in turn leads to a rocker on a second rod passing through the rear bearer plate of the motor. To the left side of this through-rod is fitted another rocker, and this is connected to a "heel-and-toe" pedal on the left footboard. When the rider presses down the toe pad, the clutch is disengaged, and when he presses the heel pad, the clutch is put into action again. The actual clutches on all models are the same as in 1912. The two-speed gear is suspended from a special "bottom bracket," forming the lower member of the rear frame, and the sliding dogs are operated as in former models. With the exception of a re-designing casing it is similar to that used during the 1912 season. The top of the gear casing has four bolts, whose heads fit in rectangular slots in the bottom bracket, permitting of fore and aft movement when it is necessary to adjust the primary chain distance. A plate fits over the top of the bracket when the machine is in service.

Brakes.—On the two-speed models the braking system is the same as on similar models of the previous season. An external contracting band, operated by a finger lever on the left handlebar, acts on a drum on the right side of the rear hub, while an internal expanding brake on the same drum is operated by a foot-pedal on the right footboard. On the regular models, the Corbin band brake is used, but there are two methods of actuation. The first is by back-pedaling, while the second is by means of an upright lever at the left side of the hub. This lever is connected to a foot-pedal mounted on the same pin as the clutch lever and easily accessible to the rider. No matter where the rider may have his foot, he can set the brake without loss of time by this arrangement. The rear hubs are all ball-bearing. The Bowden cylinder is now

mounted on the rear fork and acts horizontally.

Footboards.—These are fitted to all models, whether two-speed or regular. The upper faces, diamond-pointed and bearing the characteristic Indian mark, are of aluminum plate.

Rear Construction on Single Two-Speed Model, Showing Spring Frame and New Muffler Tail-Pipe.

On the two-speed models the footboards are fitted directly below the motor and attached to the crankcase and bearer plates, while on the regular machines they are well forward, clear of the pedals and attached to the loop tube.

Frame.—Changes in the front portion of the frame are in the nature of refinements. The steering-head is larger and the races are equipped with $\frac{1}{4}$ -inch balls. There is a reinforcement in the fork crown which extends downward 4 inches. The top tube is sloped downward toward the rear, giving a lower saddle position than on the 1912 models. To the seatmast is welded the fitting for the rear or spring frame.

Spring Frame and Fork.—At the foot of the seatmast tube is fitted a cross tube on which the rear forks oscillate vertically. This tube is bushed and provided with oil cups. Extending vertically from the upper portion of the slider forks on each side is a tubular member which carries a yoke similar to that used in the cradle-type spring fork at the front. These yokes in turn are connected by a U-fitting which goes over the mudguard. The scroll ends of the leaf or cradle springs fit within these yokes and the butts are clamped between spring pads on a special steel drop forging which is welded to the rear of the frame. Each spring has seven leaves; the two upper ones are short while the third and lowest extend only slightly beyond the yoke. The intermediate leaves are formed into the scroll, which is fastened to the lower yoke pin by the usual roll.

Spring Frame Action.—The action is as follows: On the wheel striking an irregularity in the road, the whole of the spring frame rises, pivoting about the cross bearing and deflecting the springs upward, according to the nature of the irregularity. When conditions are normal, the frame resumes its original position with relation to the main frame. The action is very soft and easy, and the extreme deflection varies from 4 inches upward to $1\frac{1}{2}$ inches downward from the normal position. A special vanadium alloy is used in the composition of the springs. The front spring fork is the same as has been used on previous Indian machines. The widths are naturally greater to admit of the wider mud-guard and tire chains. Dust and water caps are fitted at the joints on the live forks of the front spring fork.

On the two-speed models, the forging mentioned is fitted with a brace-bar between whose lower end and that of the seat mast tube is placed the bottom bracket. On the regular models this bar is omitted. The forging is U-shaped and forked, and the pads are coupled by three bolts, the front ones passing through all the spring leaves.

7 h. Twin Model With T. T. Two-Speed.

Connecting-Rod Forked Big-End, Showing Roller Bearing and Reinforcing Piece.

Tanks.—The gasoline tank is thinner and smaller in the tail, and the oil tank is thinner to fit between the seat mast tube and cylinder.

Starter.—This has been strengthened throughout. The foot-pin is hinged so that it can be turned out of the way of the rider's foot when not in use, and the pin is provided with a rubber tread. The latch taking the rebound now fits closely to the shank of the foot lever and there is no projection on its end to catch in anything. Other details remain the same.

Mudguards, Wheels and Tires.—The mudguards are of heavier stock, with turned edges and so situated as to permit of the use of 3-inch tires and of tire chains without

Rear Construction on Regular Twin, Showing Frame Springing, Protected Transmission, and Novel Connection Between Springs and Frame Proper.

striking. Wheels are 28 inches in diameter and fitted with heavier rims; $2\frac{3}{4}$ -inch United States tires are supplied, this make being standard on the 1913 product. The exception to this tire size is made on the 7 h. two-speed model, which is regularly fitted with 3-inch tires.

Control.—This has been practically unchanged as far as the motor is concerned. On the two-speed models the clutch is actuated by

Swinging Foot-Pin of Starter With Rubber Tread. Recoil Latch Showing Close Fit to Lever Shank.

the left foot and the brakes by either left hand or right foot, or both. On the regular models the clutch is operated by a hand lever and the brake by a foot pedal or by back-pedaling with the regular pedals. A push-type, short-circuiting switch is fitted on the right handlebar of the two-speed models also.

Other Equipment.—A luggage-carrier of tubular framing is a regular fitting on all machines, and the tool box is held on a step at the rear of the carrier. This position gives ready access to the kit and leaves the top tube free for other purposes. The Superba saddle, of Mesinger make, is also stock equipment.

Color, etc.—The standard color is Indian red, the blue having been discontinued. Wheelbases are: regular models, 55 inches; two-speed models, 58 inches, these dimensions being an increase of 3 inches over those of 1912.

MADE 2,000-MILE TOUR.

CHARLES ALLWARDT, of Chico, Cal., recently completed a 2,000-mile motorcycle trip within two weeks, averaging about 150 miles per day. He made the round trip from Butte to Salinas, missing one day's travel and passing through San Francisco, Sacramento, Marysville, San Jose, Salinas, Oakland, Santa Cruz and Stockton.

BECHTOL'S UPKEEP RECORD.

CA. BECHTOL, of Gallion, Ohio, covered 4,172 miles on his motorcycle between January 1 and October 2 and gives the following account of his operating expenses: 44 gallons of gasoline, at a total cost of \$9.47; 17 gallons of oil (best grade), at \$10.26, and repairs amounting to \$5.75, making a total of \$25.48. During the period mentioned he missed only fourteen days of riding.

PUEBLO'S SEVERE RUN.

ELBERT JOHNSON, Harley-Davidson, was the winner of the road race held recently by the Sunville M. C., of Pueblo, Col., from Pueblo to Florence and return. Johnson covered the 66-mile course in one hour and forty-seven minutes. The roads were bad and very hilly.

HARRISBURG HAS A CLUB.

AT a recent meeting of the motorcycle riders of Harrisburg, Pa., a club was formed and the following officers were elected: C. Heagy, president; H. Heagy, vice-president; J. Keller, secretary, and S. Gougle, treasurer.

AT a recent meeting of the Victoria Motorcycle Club, of Victoria, B. C., it was decided to fine any member who uses his muffler cut-out within the city limits.

SEEKING A BETTER LAW.

A MEETING of the motorcyclists in Salt Lake City, Utah, has been called for the purpose of discussing a State motorcycle law, and to frame up papers to be presented to the legislature in the hope that more liberal laws concerning the motorcycle may be enacted. At the present time the riders are compelled to pay a fee of \$3.25 annually, for a local license only, and they are constantly hampered by the varying speed laws while traveling from town to town.

GIVES UP BICYCLES.

CF. DIX, of Stockton, N. J., who has for some time handled bicycles in connection with Indian motorcycles, has disposed of his push-bike business and will devote his entire time to the advancement of the motorcycle in his section.

MEMBERS of the Allegheny (Pa.) M. C., 150 strong, participated in their first club run recently, and the photograph shows them lined up ready for the start. The pic-

ture was taken in front of the headquarters of Harry L. Neff, 106-108 Federal street. The club is making rapid progress, and it is worthy of note that all the local dealers are

co-operating most effectively for its advancement. Officers have been elected as follows: J. Scott Graham, president; William Maier, treasurer; Harry L. Neff, secretary.

NEW TWIN FEATURES 1913 EMBLEM LINE

In Addition to Standard Single and Twin Seven Angola Company Will Produce 10 h. Chain-Driven Mount—1913 Models Have Mechanical Inlet Valves, New Cam-Gear Arrangement, Wider Forks and Improved Muffler—November Deliveries.

In consideration of the Emblem line for 1913, attention will at once be attracted to a new member of the Angola family, a sturdy 10 h. twin, which is designed to meet all the requirements of the rider who needs exceptional power in his mount. In addition to this model the company will produce its standard single and its twin 7, the former being furnished with either flat or V belt or chain drive, and with battery or magneto ignition; the latter being fitted with chain drive and magneto ignition only.

Mechanical Inlets Standard.

Mechanical inlet valves are now standard on Emblem machines, with a pushrod overhead rockerarm and in the camcase there is an interesting departure from common practice. All four cams on the twin—and the single's two—are mounted on one gear. This cam gear has a hollow shaft, and holes are drilled all the way through to permit of proper distribution of oil, thus insuring lubrication of the cam surfaces at all times.

This arrangement, in addition to providing for a compact camcase, simplifies valve timing. Because of the key fitted, the cam-gear cannot be replaced in other than the proper position, after it has been removed for any purpose. When the gear is slipped into position the valves are automatically given their correct timing. The perfecting of this valve gear must be credited to Superintendent J. C. Glas, who conducted an exhaustive series of experiments and tests before he was ready to give the improvement his O. K.

Bronze Bearings.

Emblem motors now have plain bronze bearings, new to the company's power plants, and several other refinements are noted. The cooling flanges on the cylinders are graduated in the 1913 machines, being wider at the top, thus permitting of the use of a lighter casting and giving a better general appearance. This arrangement also gives the greatest radiation area around the combustion chamber where the heat is most intense. The Heiger carburetor is standard equipment on the Emblem models as in the past.

No radical change has been made in the appearance of the machines, and the lines with which riders have familiarized themselves will be easily distinguishable in the Angola products for the coming season. Larger tanks are among the desirable new features of the machines; the capacity of the gasoline reservoir is now nine quarts and three quarts of oil may be carried.

Wider Forks are Fitted.

The spring fork embodies an improvement in that it gives the effect of a pneumatic cushion. There is an arrangement of packing around the plunger by means of which the air is compressed as the plunger starts its upward movement from the effects of a jar; the air cushion thus formed softens the action and assists materially in absorbing the shock. The forks are somewhat wider than in previous models, the additional allowance being made for heavier tires and to prevent mud from jamming between wheels and forks. There is

sufficient room for tire chains should they be found necessary in heavy going.

The Emblem spring fork dates back to 1904, when it was constructed essentially as it is today. So satisfactorily has it met the "test of time" that the company has not felt called upon to make a radical change in it. The flat, shock-absorbing spring used in connection with the seatpost on former models is retained, its performances over all kinds of roads having convinced the designers that it would be difficult to improve upon it.

An Aluminum Silencer.

Another new feature of the Emblem line for 1913 is an aluminum muffler. It is constructed with two compartments and is packed with asbestos. Tests have demonstrated that by the time the exhaust gases are forced through this device they are split up and cooled so that their final discharge into the air is not attended by any appreciable disturbance. Although the new muffler practically eliminates noise from the exhaust it causes little or no back pressure.

A sight-feed oil is provided in addition to a hand pump to take care of the lubrication, the simplicity and dependability of this system having led the company's designers to incorporate it in their improved 1913 models.

New Three-Piece Crank.

The new machines embrace a three-piece

A. Winnick, of New Haven, Conn., and Home-Made Sidecar Outfit on Which He is Using an Eclipse Clutch With Excellent Results.

crank, which is interchangeable so that a crank may be used on either the right or left side as it is needed. The Eclipse clutch is standard equipment. It has handlebar control, by a special lever of Emblem manufacture, or a side lever will be fitted if specified. The Corbin and new multiple-disc Eclipse brakes are optional. The frame head is of improved design, the forging having a large curved web between the upper and lower top tubes of the frames, thus affording additional strength at this vital point. The frames are regularly fitted with lugs for fastening tandem seat or a luggage carrier, so that the attachments may be fitter and removed with minimum trouble and loss of time. Incidentally, the Emblem tandem, which was formerly made for fitting to Emblem machines exclusively, is now supplied with fixtures which permit of its use on any standard motorcycle. For 1913 the Emblem machines will carry Troxel or Mesinger saddles at the option of the purchaser.

Emblem characteristics are also carried into the improved luggage carrier, which is of unusually sturdy construction. The framework is of channel iron, with five bars across the top. There are no joints to jar loose as all fastenings are brazed.

Deliveries in November.

Announcement is made that deliveries of the new models will begin in November, and an output of at least 4,000 machines is counted. The recent big addition to the plant doubles the company's floor space and will enable the force to keep abreast of orders in a way that has not heretofore been possible. The new five-story structure will be occupied at once and several thousand dollars' worth of machinery has already been installed. President W. G. Schack has his organization tuned up for big things and that his expectations will be realized is evident from the interest already displayed in the line with which the Angola company will meet the demands of its patrons for 1913.

ENDED TEN-YEAR SEARCH

FURTHER proof that MOTORCYCLE ILLUSTRATED may be depended upon to give results under all reasonable conditions is embraced in a letter received a few days ago from the Miami factory. A few weeks back a photograph of C. J. Kester, the new superintendent at the Flying Merkel headquarters, was published in these columns, and through it a friend who had been watching for news of Mr. Kester for the last ten years got into communication with him once more. The friend is now located in a small town in southern California. Following his discovery of the photograph there was a long-distance reunion which brought the participants mutual rejoicing.

TOURED TO SPRINGFIELD

F. W. HUELS, Indian agent at Madison, Wis., recently made a trip to the Wigwam at Springfield to arrange for his 1913 stock. En route he stopped at Buffalo, Albany, Boston, New York City, Washington, D. C., Chicago and Milwaukee.

SEEING AMERICA FIRST

How One Motorcyclist Made A Training Trip from Champaign, Illinois, to Virginia and Back to Boston Before Sailing for a 3,500-mile European Tour.

F. W. BAUM

DURING the winter months several of my motorcycle friends were accustomed to assemble at my home and discuss the merits of various motorcycles. The conversation drifted in time to touring in Europe by motorcycle, and as I had made a trip of this character during the summer of 1910, it naturally devolved upon me to give data and advice. The outcome of these gatherings was a desire on the part of my friends to make such a trip, starting in June after the close of the university. As it was agreed that two in a party was enough, we began to pair off, and I was pleased to find that Mark Henson, of Urbana, Ill., would be my partner.

Owing to various changes in our plans, we hardly knew what machines we would ride. The months flew along and still we had not obtained our machines. I ordered a new 8 h. M-M twin, with Spartan V-belt drive, and my partner at the last moment ordered a Harley-Davidson twin. It was upon the arrival of his machine that our date of departure depended. After Henson's machine was received the work of placing the equipment and luggage began in earnest, and it was a job demanding a lot of thinking. On account of various fittings on my upper tank bar I could not put my luggage there, as I greatly desired to do, and on a trip to Chicago I purchased an Atlas luggage carrier, guaranteed to support 500 pounds. I next bought three yards of 15 oz. canvas into which I securely rolled my luggage, then fastened it onto the carrier with five-foot straps one and a half inches wide. I had had trouble before in carrying a suitcase and also with straps that were too small. Henson had a heavy canvas bag in the form of a government haversack, which he securely strapped to his tank.

The Start from Danville.

At last came the morning for our departure, and to avoid the "gumbo" clay roads of Illinois, we checked our machines to Danville and made our formal start from that point. We had breakfast and then, as I had been over the roads before, I started out to be the pilot. Not far out it entered Henson's cranium to take the lead, and I did not interfere with him. After we left Covington, Ind., he took the wrong road and I knew it; but he was quite a distance in front, so I thought I would let him go and "rub it in" afterwards. About eight miles out of Crawfordsville it began to dawn on him that he was "in bad." The road was so muddy that we could hardly keep in the saddles, but our powerful twins plowed right along. It was utterly impossible to pick a path to ride on; we gave that up as a bad job. Next we tried to run alongside the machines, but the mud was too deep. Henson's mudguards quickly became packed with the

F. W. Baum.

sticky clay, which acted as a brake. Several times he had to stop and dig out the mud with the handle of his pliers.

Finally we rolled into Crawfordsville, Ind., and procured quarters in the Y. M. C. A. building. We got up before the building was opened and climbed down the fire escapes to within eleven feet of the ground, then dropped the rest of the way. At the garage Henson noticed that his rear tire was flat, so we took out the tube, but could find no leak, even when it was placed in water. We tore off a patch thinking it was responsible for the trouble, repatched it, and placed the tube in the casing. Then we pumped it up and instantly found the air escaping. That tube was taken out four times without finding the real cause of the trouble. Suddenly I had a "hunch"; I tried the valve stem and found it loose in the tube.

Fitting Accessories.

It was only seven miles to New Ross, but I had two falls while riding the three-rut roads; there were two ruts where wagon wheels ran and another bad one where horses traveled. It was poor going all of the forty miles to Indianapolis, as we rode through a drizzling rain. At 11.45 Wednesday morning we arrived at Indianapolis. Here we bought our accessories. First we hunted up the Stewart speedometer salesroom and had a front wheel drive No. 43 instrument put on Henson's

Harley—I already had a Stewart rear drive. We next went out to the Heitger carbureter factory at 1225 Beecher street and both had Heitger instruments put on our machines. Next in order came our lighting systems. We had Prest-O-Lite gauge tanks put on. We also needed extra tubes, so procured one each at the Diamond branch.

At one o'clock the next afternoon we left for Dayton, Ohio. The roads were excellent and at 1.25 p. m. we went through Greenfield, which has a large fine courthouse on the new National road. In some way Henson's brake locked as he was hitting up a fast clip and his rear wheel slid at least 60 feet over the gravel. Upon examination, we found that he had used up several hundred miles of his tread in the slide.

From Dayton to Springfield.

For twenty miles out of Dayton the route was very rough. It was while riding over these roads that my baggage became loosened and my Schebler carbureter, which I had put in the luggage roll, found an opening and dropped out. It was too late to return and look for it, so I was obliged to forget it.

We arrived in Dayton at 7 p. m., 240 miles from home. We did not tarry long in this city, but set out for Springfield, about 45 miles distant. It was getting quite dark, however, and ten miles east of Dayton we decided to close our ride for the day; we were without headlights. Owing to a mistake in shipping our Rushmore lights, Henson had billed them through to Columbus, Ohio, instead of to Indianapolis. We had to ship them because we could not obtain suitable brackets before starting.

We put our machines in a barn and slept in the hay. At about 7 o'clock the next morning we arose and started again for Springfield. The roads were mediocre until a few miles from the city and then they were fine. After spending a few hours in Springfield we left for Columbus, and about 13 miles from this city found a boulevard-like road.

A Rear-End Collision.

Our first desire upon reaching Columbus was to find our way to the American Express Company and get our headlights. We found our lamps intact and quickly clamped them on our machines. Suddenly I remembered that the American Motor Company had shipped me a shock-absorber, in care of the Diamond Tire Company, and I hastily procured the road smoother and attached it to my machine. Then we were soon off for Zanesville, Ohio, 54 miles away. As it was late in the afternoon when we left Columbus, we did not arrive in Zanesville until 5 o'clock, and we decided to put up there for the night. Early the next morning we left for Wheeling, W. Va. We took

breakfast in Cambridge and then went to St. Clairsville. Before reaching Wheeling, we ran into considerable mud. Henson, who was riding directly ahead of me suddenly struck a chuck hole, and as it was too late for me to stop, we had a rear-end collision. Henson's stand was bent, and we found a garage and had it straightened. Then we rode about the city. The streets, although leading up and down steep hills, were well paved. We were escorted out of the city by a fellow motorcyclist, who rode with us for about five miles. The National road soon became a mass of projecting rocks, as the original ballast had all been washed away. Little did we realize that this was the characteristic condition of the road for many miles. The authorities of Washington, Pa., however, have rebuilt about eight miles of the Pike.

A Long Mountain Climb.

Finally we reached West Brownsville, where we paid five cents toll to Brownsville. We there saw on our right what was left of the old National Pike bridge, which for several years has not been used. From here on, there was pretty scenery up to the Summit House Hotel, which was reached from the west after a long, winding climb up a bad mountain road. At one place we had to push our machines through deep clay gumbo, a feat next to impossible, or ride to the edge of the old Pike, and let our machines down on a plank

to the road five feet below. We chose the latter course.

There was another mile of climb from this point to the Summit House, so I set out. My twin nobly made the steep grade and after I had waited a while, I began to be worried about Henson. I could not see him coming over the brow of the mountain, so I coasted down for half a mile to where Mark was sitting alongside his machine "all in." He had had difficulty in making his engine develop its rated horsepower because he was loath to change his carbureter, even when advised that he would have to meet the climatic conditions. At last we got it to mixing properly and made the ascent.

A little further on we came to the Chalk Hill Hotel. Five miles from Chalk Hill we came upon an old settler, and asked him if there was anything of historical interest along the road. He politely informed us that within a hundred rods of the rear of his house was the site of Old Fort Necessity. We were elated at this discovery, and by climbing over fences and going down narrow lanes, we came upon this interesting place. Nearby is General Braddock's grave, and this is given considerably more recognition than the fort. The old settler told us, upon further inquiry, that "Braddock fit the Injuns all through here."

Near Grantsville, Maryland, we came down a steep incline and found that a concrete bridge

was being erected across the road. For temporary use the contractors had constructed a makeshift bridge of wood to one side of the road. The short approach at either end of this bridge was of clay, and as it had been raining there only a few hours before, this stretch was very slippery. As I started to climb the approach, my rear wheel skidded and before anything could be done my machine crashed into a post at the edge of the passage.

We could hardly realize the extent of the damage for several minutes, but when we started to push the machine up the incline the front wheel would not pass the frame. We carried it up to the level road and then made an investigation. The frame was so badly bent that the machine could not be used until repairs were made, which were entirely out of the question there.

It was while Henson and I were waiting here, unable to decide just what to do, that a Mr. Carpenter hove in sight. After a time it was decided to let Mark go to Frostburg and see what he could do about repairs, and Mr. Carpenter agreed to keep me company for the night. There were no accommodations for us nearby, so we picked out a spot in the woods suitable for a camp. About as soon as we had fire going it began to rain—one of those cold, discouraging rains. We had nothing with which to cover our machines so they had to take a wetting.

1—Baum's start from Champaign, Ill.; 2—A sight-seeing stop in Hartford, Conn.; 3—A stretch of Virginia road;

4—One point at which the roads were being "repaired"; 5—A stop just outside Boston.

We walked about two miles to a farmhouse, formerly called the "Stone House Tavern," on the National road, and sat down to a good supper with twenty-two farm hands. We waited a while for the rain to diminish, and finally waded back to our machines. We had decided to stay with them for the night.

A Memorable Night.

We used a large, decayed branch on which to hang our wet clothes, placing the butt end of this branch at the base of the fire and arching the other part over our bunk. I hung my coat and raincoat on little stub knots of the branch. Carpenter awakened me some time later and said something was burning other than the wood. I jumped up and found that the fire had eaten its way up the hollow log and out at the knots on which I had hung my coat. I found that it had badly burned my coat, melted my fountain pen, and nearly destroyed my book of travelers' cheques.

About noon Henson and a native came driving up with a spring wagon. We loaded the machine and hauled it to a garage in Frostburg. There I found a repair man who said he could fix the machine. I let him work on it, and returned to Frostburg that evening with the repaired frame. We assembled the machine and were ready for the road again.

Winning a Wager.

The repairman asked me if my M-M would climb Big Savage Mountain. I told him it would, having full confidence in the machine. He told me to try it and I did. The road is three miles long, and quite steep, but I made the ascent. I returned and told him of my success, and added that I could take him up also on the luggage carrier. He said if I could do it he would cancel my bill at the garage, and if I couldn't I should pay double. I agreed to this and took him up the mountain at thirty miles an hour. He was surprised and took his defeat with a laugh. We were now ready for our trip to Washington, D. C.

We left Cumberland, Md., about noon and started for Winchester, Va., the road being full of sharp curves, streams to be forded, rocks and steep grades. We dipped, bumped and climbed, and at last wended our corkscrew-like way to a little hamlet that was honored by the name of Springfield. It was getting late so we put our machines up in a blacksmith shop

and found lodgings for the night. In the morning I was off for Winchester, Va. This is where I had to part company with Henson, as his journey was scheduled a little differently from mine. I crossed the Big Capon River to Winchester and went from there to Hagerstown, Md., and over a fairly good road to Harper's Ferry. From here the road runs close to the river all the way into Washington and, in our opinion, the roads are decidedly poor for a government's capital district.

Leaving Washington.

On arriving in Washington I went directly to the Diamond Tire Company's office, where I was treated very cordially. I cleaned my machine, went over the mechanical parts carefully, and tightened all nuts and spokes. Another thing to look after is the tread of the tires, so I took a small knife and picked out all of the foreign matter that had worked its way into the tread.

A peculiar thing happened to me while in Washington; I was going along Pennsylvania avenue when a chap on a Merkel rode up to me and asked if I were not the fellow whom he allowed to try his machine two years before. I told him that I guessed I was, but would give him credit for having the best memory for faces of any one I knew, for it was only for five minutes that I was with him in 1910.

On the morning of July 7 I left for Baltimore. At Royal, I met a fellow on a four-cylinder machine bound for Philadelphia, so we decided to go together. He was an aviator of some experience as well as a motorcyclist. We rode through heavy sand for a few miles, and then came to a fairly decent road.

I arrived in Baltimore with my machine in good condition, but I was out of gear mentally because of the rough paving on the streets of Baltimore. This city has the most abominable pavements I ever encountered; they were really worse than the National Pike. For the sake of my machine I left it in a garage and did my city riding on the street cars. There was little to interest me here so the next morning found me on the road to Philadelphia. I left Baltimore over the Valley road, which is very good, but winding, makes speeding dangerous. I had a give-and-take road to Havre-de-Grace, where after paying twenty-five cents toll, I went over the Susquehanna Bridge.

On the Way to New York.

From here on to within three miles of Newark, Delaware, I encountered the deepest sand I had ever struck. The roads were very difficult to ride, as you had to put your feet out and sort of walk them along the top of the ruts to steady your machine. I made good time over the macadam road into Newark and on to Arlington; two miles before I reached the latter place I paid five cents toll to ride over four miles of smooth macadam—and it was worth it. From this point I went into Pennsylvania again, and rode along the Delaware River to Chester; a thriving city of 40,000 inhabitants. I arrived in Philadelphia late in the afternoon and stayed there until noon of the next day, in the meantime visiting such historical points of interest as Independence Hall, Franklin's home, etc. I left Philadelphia at 12.25 p. m. for New York, and took the road to Trenton, N. J., where the natives will show you just where Washington crossed the Delaware. From Trenton route goes through New Brunswick to Perth Amboy. I paid ten cents to cross on the ferry from Perth Amboy to Tottenville, Staten Island.

The road through the island to St. George is fine. After riding in a hard rain from New Brunswick to Perth Amboy it was a relief to get on smooth, dry macadam. I will not say how fast I rode over the island, but then the road was in such fine condition I just couldn't help "letting her out." I had not gone far when a brother motorcyclist signaled me to stop, and then told me to look out for motorcycle officers in plain clothes, as they were "pinching" many of the autoists and riders. I thanked him and rode on more carefully, but not very slowly, to St. George. Here I crossed to New York City for fifteen cents. Arriving at the Battery, I rode directly up Broadway to the Diamond Tire building and there left my baggage.

A Visit to the Hub.

On the morning of June 12 I was ready for a 256-mile ride to Boston. I followed upper Broadway for several miles, and eventually came upon the Boston Post road. Owing to recent rains the road was bad, as the oily surface would not allow the water to soak into the ground; in many places it remained in puddles. I stopped at New Haven, Conn., and visited Yale University. Between New Haven and Boston I made a few stops, one for a visit at the Persons saddle company's

Business Before Pleasure.

plant in Worcester, Mass. I arrived in Boston at dusk, having made a very fast day's run. I wished to see the home of my machine, so after a fine sleep I left for Brockton, a distance of twenty-one miles over good roads.

At the M-M Factory.

On the erecting floor at the M-M factory, I was much interested in the new Eagle, the recent product of the American Motor Co. The large nine horsepower motor and beautiful lines of the machine appealed to me, and I had a longing to possess one. Although I hated to part with my M-M, which had so successfully carried me over 2,000 miles of roads, I eventually traded in my old machine for a new Eagle twin. I transferred all my equipment from my other machine to the new one, even to the tires, as I wished to see how long they would last. Then I returned to Boston, and the next day I made arrangements to sail with my machine for Liverpool on the steam *Bohemian*.

(To be continued.)

A HARRISBURG SQUAD

FOURTEEN months ago there was only one Harley-Davidson machine in Harrisburg, Pa. Now there are—well, the photograph tells the story. Heagy Bros. have conducted the H-D campaign in Harrisburg, and they are naturally proud of the results they have achieved.

HELD POSTPONED HILL-CLIMB.

FOR some time a special committee of the Providence (R. I.) Motorcycle Club has been looking for a suitable hill on which to hold the climb which was postponed from last summer, and only recently a suitable grade was located. The committee selected a hill about half a mile long, fairly steep, straight and of good macadam surface. B. A. Swenson won the event in 25 seconds; Cliff Frozier was second; J. C. Garand, third; C. A. Anderson, fourth; A. Carlson, fifth, and J. G. Edwards, sixth. The club also announces the opening of its pool tournament on November 1. Preliminaries will be played for 100 points, and the final contest will be for 300 points.

MOTORCYCLE CLUB LEADS.

WITH 100 machines, all decorated, members of the Bay Ridge Motorcycle Club of Brooklyn, N. Y., headed the parade recently held in celebration of the extension of the Fourth avenue subway. All along the line the boys were applauded. After passing the reviewing stand they proceeded to the clubhouse where luncheon was served.

The members are looking forward to the smoker which takes place November 1, and are also anxiously awaiting the result of the pool match between President Campbell and Chairman Deckelmann, two crack shots. The annual ball will be held at the Borough Park Clubhouse on January 13.

FOR SIDECAR LUGGAGE.

A NUMBER of English side-car designers have turned their attention to luggage-carrying devices for the third-wheel passenger attachments, and as a result the problem is being satisfactorily disposed of. The accompanying illustration shows a side-car fitted with a new rear luggage rack, or frame. It will be

noted that there are two sections in the frame, one of which may be used for a trunk and the other for an extra oil can or similar article.

MERKEL AGENTS.

FERD STENGER, of 802 Vine street, Cincinnati, has just closed for the 1913 Flying Merkel agency, and has ordered half a carload of machines to open the season with. A new Miami agency has also been placed in Akron, Ohio, where William Coleman will represent the Middletown folks for the coming season. Coleman will open a new establishment and handle the Miami products exclusively. Newby Bros., of Kansas City, Mo., have closed for three counties in Missouri and fourteen counties in eastern Kansas. The W. D. Andrews Company, of Buffalo, N. Y., will distribute Merkel machines in western New York and eastern Pennsylvania, and Fred J. Barr will handle a large section of Iowa. These agencies were all closed in one week by Assistant Sales Manager Valiant, who is now on the road. "Val" reports, by the way, that half the 1913 output of the Merkel plant has already been contracted for, despite the fact that the company has not yet made its announcement.

A SIDECAR OUTING.

HOWARD TROMANS and Arthur Barber, with Misses Mildred Hyland and Nina Colvin as side-car companions, recently made a motorcycle trip from Providence, R. I., to Danielson, Conn.

SURVIVED THE STRAIN.

IN the accompanying photograph is shown a Baxter side-car which was entered in both the Triangle and the Providence runs, recently held; it finished with a perfect score in the latter. It was attached to a single Indian, and thus proved the adaptability of the single machine for side-car work. The picture shows the machine fitted for the Triangle run, with a Mr. Clark in the side-car and J. S. Baxter on the Indian; the third party is Mr. McDonald, a Hendee representative. The side-car stood up well under the severe tests, climbing both Jacob's Ladder and Leicester hill during the run. Its failure to finish in the Triangle test was due to no fault of its own; magneto trouble was encountered at the

top of Jacob's Ladder, and so much time was lost that the crew of this side-car outfit could not catch up with the schedule. Between the Triangle run and the Providence run the machine and side-car had covered just 500 miles, which makes its perfect score in the latter all the more remarkable. The side-car shown is an \$80 model, which is in big demand.

SOUTHERN ENTHUSIASM.

WHEN it comes to enthusiasm, P. M. Huff, Harley-Davidson agent in Piedmont, S. C., probably has a slight lead on most of his competitors. He recently wired the H-D factory as follows: "Have a fine boy a month old and have named him Harley, after your Mr. William S. Harley."

A CHESTNUTTING TRIP

A SUNDAY run to Hanover was recently held by the members of Maryland Motorcycle Club, of Baltimore. The route had previously been gone over by one of the riders, who had selected some fine chestnut groves, where the boys had no difficulty in loading up.

READING CLUB ENTERTAINS

MORE than thirty members of the Harrisburg Motorcycle Club recently made a run to Reading, where they were guests of the Berks County M. C. A chicken dinner was served in the Reading clubrooms for the visitors, whose appetites were keen.

My FIRST YEAR ON the ROAD

By PHILIP · H · COX

"WHAT'S the matter, Mister, won't she go?"

The speaker was the proverbial small boy who invariably appears on the scene when the motor refuses to move, and his innocent but irritating query was addressed to me on a certain afternoon when I was trying out my first machine. For a moment I glared at that boy, but finally I was obliged to take him into confidence and confess that "she" would not go. This should have been obvious to the ordinary observer, but that boy forced me to make the statement baldly; "she" wouldn't go, and I had to admit it.

I had had my Excelsior 4 battery model but a few days and was just itching to try it out. It was late in the afternoon of a hot July day when I pushed it out of the shed and prepared to take my first spin. As I had been used to riding a bicycle for years previous to getting the motor, I was surprised at the difference in the weight, my bike weighing 30 pounds and the motor 200. Well, I tried it on the stand first, just to hear it run. Then as I had no free engine clutch, I ran alongside the machine till it fired and mounted from the pedal. I enjoyed a ride of ten miles and was about one mile from home when on turning a sharp corner I shut off the power and then turned it on again, but there was no response. I put the machine on the stand and pedaled and pedaled, but could not get an explosion. As I have already said, the weather was hot and close and to make matters worse, the mosquitoes were getting in their fine work, so I decided to push my mount home.

I worked on it two hours that night, but as I knew practically nothing of the fundamentals of a gas engine, I made no progress and finally telephoned two friends of mine and they both promised to call in the morning and look it over. Well, we tackled it in

the morning and had worked about an hour when some one suggested cleaning the spark plug with gasoline. I immediately attempted to draw some from the pet-cock, but it would not run, so I looked in the filler hole at the top of the tank and you can imagine my disgust on finding the tank empty. Needless to state, this was a lesson and I have not been caught that way since, though I have ridden thousands of miles.

A Year of Uncertainty.

During the first year that I rode a motorcycle I seldom took a ride that something did not happen to the machine that would cause my heart to palpitate in the fear that I would be unable to correct the trouble and would then have the problem of getting both myself and the machine home. By the end of that year, however, I had sampled nearly all the ills known to the motorcycle. Now that I look back on those experiences I realize that nothing of a serious nature occurred, such as parts of the engine breaking, but only little things, like valves sticking, loose terminals, etc. One day my machine was working per-

fectly, when suddenly it refused to fire. I continued to coast along while trying to manipulate the grip controls so that I might induce a return to life, when I discovered it would fire when the throttle was full open. I put it on the stand and spent about an hour trying to figure out the trouble and then decided, as it was getting dark, that I had better push the machine home.

Again I telephoned a motoring friend of my troubles and he came and looked the mount over with me. When I told him of the "symptoms" he said: "Your automatic air shutter must be stuck so that it opens only with the full suction of the open throttle," and sure enough when he tried to open the shutter with a match he found it almost impossible to loosen it; when we finally worked it loose I had no more trouble, and during 10,000 miles of riding this valve stuck only three times. Still I never forgot those symptoms, and while my first experience caused me to push the machine home and spend hours locating the hitch, the subsequent troubles were remedied without leaving the saddle—I simply used a match to force the shutter open and off I went on re-

joining that I was at least master of my machine on that point.

I believe that if there is one factor in my experience that has contributed more to stimulate my love for the motorcycle than any other it is the fact that I have generally learned the cause of my trouble as well as the cure, thereby becoming its master. The most frequent motor trouble I had was caused by the platinum points requiring adjustment. I soon learned that the points I had required adjusting about every 75 to 100 miles. I finally bought platinum iridium points, at \$1.38 each, and they wore three times as long and did not need to be adjusted oftener than every three or four hundred miles. I found that

"After working for an hour I discovered to my disgust that the tank was empty."

most of the ignition troubles had about the same symptoms and that they never need to be confused with carburetor problems.

I might say that while riding 10,000 miles on this machine I never found my carburetor responsible for stoppages or trouble except when the shutter in the automatic air valve stuck fast three times and the float stuck once.

A Mysterious Stoppage.

I used to take my wife out on the tandem seat a great deal, and as I live in North Jersey it is almost impossible to go for a ride without having to negotiate hills. I had found that a 4 h. machine had to be in pretty good condition to take this load up the hills, and that if there is a weak spot anywhere in the machine it will be sure to be found. We were riding tandem one day when we noticed on the hills that the motor seemed to miss explosions in a strange way, until finally as we were climbing an unusually long grade the motor stopped. I put it on the stand and, lo! it went as fine as ever, so I jumped on alone, right there on the side of the hill, and went up to the top all right, but I knew there was something wrong and decided to investigate at once. I figured at once that the motor fired too well up to the time it stopped altogether for the stoppage to be due to ignition trouble.

I was sure it was not the carburetor, but it did seem as if the gasoline pipe might be stopped up, because my trouble was emphasized as I opened my throttle for a length of time. On removing the feed pipe at the carburetor, I found there was very little gasoline running; then I took off the part connected to the tank, which contains the strainer, and found the cause of my trouble was accumulated dirt at this point. After cleaning this out and reconnecting the pipes I found my trouble was entirely removed. Now, as you can readily see, this might have kept me guessing a good while if I had not mastered each problem as it had occurred up to this time so that I was able to apply a process of elimination.

Handling Ignition Troubles.

I was on a trip through Long Island when I noticed that while the motor ran well on a retarded spark, it would miss on the advance. On looking over the machine I decided this trouble was not caused by the platinum points, because it was firing regularly on the retarded spark. For the same reason I knew it was not caused by the spark plug, nor was it brought about by weak batteries, because my spark was up to its regular efficiency while retarded; so I reached the conclusion that the current was interrupted by a break in the wiring, and sure enough the constant change of the position of the commutator had broken the primary wire. I always carried a piece of wire along to make such repairs, and it was only necessary to splice the broken wire together and tape it and I was ready to go. How simple a thing may bring your engine to a standstill, and yet how simple a matter it is to remedy the trouble when you are acquainted with your machine and have the wherewithal to do the work.

When the terminals work loose you will notice that your engine will miss firing occasionally or altogether, depending on whether they make any contact or not. When your batteries are weak you will get symptoms that are different from most any others, because the result is a weak spark. Your motor may not miss an explosion after you have got your load under way, but you will notice that it is

Philip H. Cox and His Tandem Mount.

almost impossible to start; also you will be unable to make the hills you used to make with ease. By taking a screwdriver and making a circuit between the commutator and the crankcase you will notice whether the spark is snappy or sluggish. I recall an experience I had one day when I had my wife on the tandem seat and I had such symptoms as I have just described; I jumped to the conclusion that my batteries had run down, and left my wife by the roadside while I rode about five miles to the nearest garage for batteries.

An Incorrect Diagnosis.

As soon as I had lightened my load I felt my engine work better, so I was sure I had judged correctly. The batteries were soon in place and I hurried back. We started for home with about fifteen miles to go, and on taking the first hill I observed the same old trouble, a weak spark; it did not miss, but lacked power. By letting my wife walk the worst of the hills, we finally got home. Now, strange to say, during this experience I was aware that the platinum point on my spring was nearly gone, but thought there was enough for a while longer. I had an extra spring and point and slipped this into place and then tried it out on a hill and sure enough my trouble had been with the point and not with the batteries. On examining the old platinum I discovered that the little chunk left on the spring was only the brass that was used to solder the platinum to the spring. I used the same mica spark plug that came with the machine for 10,000 miles, and never had any trouble with it and only had to clean it three or four times.

I was preparing for a three days' trip once when a friend came along and saw me cleaning my plug. He remarked that he did not think I was getting the best results from my engine by using this particular make of plug and suggested that I try one of his that gave a "fat, hot spark." I put his in place instead of

mine and tried the engine on the stand; it ran all right, so I put my plug in my tool kit. I had quite forgotten about the plug on the following morning when I started off, but I soon noticed that the motor was not firing regularly. I stopped about ten times in the first five miles and monkeyed with the platinum points, terminals and wiring, needle valve and most every part of the motor, till finally in sheer desperation I thought of the new plug. I got out my faithful old plug, whose looks my friend did not like, and put it in place, and presto! my trouble had disappeared. Moral: When you know your machine is working all right, don't yield to the temptation to monkey with it.

Referring to Carbon.

While some riders contend that a motorcycle engine ought to be taken down and cleaned every 1,000 miles, I found that by careful oiling my engine did not carbonize until I had run 4,500 miles. It is a very easy matter to determine when this work is necessary; for instance, when climbing a long, steep grade you will notice that your motor "knocks" a great deal; also after cutting out your switch, it will sometimes continue to fire for a while. I used to dread having to do this job, but I found it quite simple. It generally required but three or four hours, providing I had some assistance to lift the motor out and put it back.

Personally, I believe a man will be happier without any machine than with a poor one. Assuming that you have a good machine, you should be able to go out for a 100-mile ride with perfect confidence in your ability to return home on time, just as you would if you employed any other type of locomotion; providing, of course, that you have made a careful study of your machine and carry the spare parts you may reasonably expect to need.

A SINGLE BARREL ENDURANCE RUN

GEORGE · M · JOHNSON

I HAVE read in the motorcycle papers of numberless endurance runs—from a big F. A. M. affair with hundreds of riders, down to some humble club jaunt with only half a score, and I have possessed a hankering to go into a good, stiff contest—the stiffer the better—and prove that I also had enough stamina, skill, and stick-to-it-iveness to jerk my own two-wheeler through the worst combination of bad roads and weather that could be sent out from Washington by the official forecaster. Finally the endurance run came along—but under the deceitful disguise of a pleasure trip, nothing less than an expedition into the haunts of the speckled trout.

One day during the past summer I was putting peacefully along when someone hailed me from the sidewalk. It was an old-time hunting and fishing comrade, and I promptly pulled up to the curb.

"Want to go trouting on Saturday?" was his greeting. "There's a chap coming out from New York to go with me, and we're planning to take a look up Woodbury way. Glad to have you come along, if you want to."

"How you going?" I asked.

"His folks live in Seymour, and we'll spend the night there. We'll drive out the next morning at four. You could come up on your machine, and then we'd start you on the right road."

"Sounds good to me," was my cordial response, "and I'm much obliged for the invitation."

An Inauspicious Start.

On Friday it rained, and I thought of those back-country roads with a sigh. However, Doc, my fellow sportsman, reported that the two of them would go rain or shine, and I hated to miss a trouting trip in a country new to me. The weather looked so doubtful that I couldn't say definitely whether I'd try it or not, but it was decided that they should wait for me until four; if I failed to appear before that hour they were to go on without me. Seymour was about twelve miles distant, an easy half hour run in good weather, but one cannot average a twenty-five mile pace over rain-soaked dirt roads. I set my alarm clock for half past two, planning to go if the rain had stopped; otherwise to slip back into the downy.

Next morning the weather was still doubtful, but there was no rain falling, and I determined to go. I fixed up a hasty breakfast and collected my junk on the machine, with the headlight working, for what with clouds and fog it was nearly as dark as pitch. My preparations took longer than I had expected,

so it was 3.30 a. m. when I finally pulled out; that gave me half an hour to make connections.

Plugging Muddy Roads.

The roads were fierce, and I skidded and slipped around in grand style; I kept dry though, for my high rubber boots were made to shed mud and water. About half way to Seymour, as I was plugging up a bad hill, the steady throb of the engine suddenly stopped, and in its place I could distinctly hear the plaintive call of whip-poor-will from across the misty uplands and meadows. It was well worth listening to, but just when I was more interested in the engine, for time was getting short. I jacked the machine up on the stand,

and started the motor on the first kick of the pedal; the difficulty was probably due to a small particle lodging in the spray nozzle, in that way shutting off the flow of gas for an instant. By using the clutch and pedalling a bit I easily started the machine up the hill. That is one beauty of a twin; by means of a clutch you can usually start one up even a steep incline.

The last few miles into Seymour were over fairly smooth roads, and in spite of their slippery condition, I opened up somewhat and went roaring along at a forty-mile clip. Even so, I was five minutes late, but the others were also a few minutes behind time, so that I made connections.

Then followed the most tiresome ride I have ever undertaken, for I had to keep in communication with the men who drove the plug. I'd ride along a couple of miles and then wait for them to catch up, and so on. My wrists became tired from the effort of holding the machine to the road; a greased pig would have been like sandpaper in comparison with that highway, and as usual they had been "repairing" it in many places, which only made matters worse. My one consolation was that it would be dry when I returned.

No Improvement in the Weather.

Everything has an end, and that early morning ride was no exception to the general rule. We left the nag and the motorcycle under the shed of a small country inn, and turned our attention to the fishing. The stream there was a good one, but rather short; there was not much room for three anglers, and so after several hours of strenuous work, we were through with it, having fairly satisfactory results to show. Then we went back to the inn, where a brief but cordial episode occurred in the room devoted to liquid nourishment.

It was then late in the morning, and the weather, instead of clearing up, was constantly getting blacker around the edges. I was minded to push for home, some twenty-five miles away, but the others had more plans for fishing and began to rave of a mystical brook, swarming with trout, and off we started again. Brother, did you ever ride a husky twin for miles and miles at the pace of a spavined skate? For your sake I hope not, as it is no blissful sensation. The worst of it was that those two guides knew only a trifle more about the location of that brook than I did, and I had never heard of it before. We stopped now and then, sometimes oftener, to ask our way at farm houses. Some people told us one thing; some another, which is the usual result when you inquire your direction.

The Author as he Appeared Before His "Single-Barrel Endurance Run."

Doc and I left the other chap, and wandered off through a wilderness of thickets and fog in which that mysterious brook had concealed itself. After we were well in, it began to rain—not a half-hearted drizzle that never gets anywhere, but one of those good old-fashioned, Daddy Noah deluges that knocks big dents in a tin roof and makes you feel like going to the bottom of the river to keep dry. Great carbureters, how it did come down! Right there I commenced to get glimpses of a solo endurance run.

When Doc and I finally escaped from that combination morass and mosquito farm, we were very wet. That's a mild word, I admit, but the strongest adjective in the English language is too feeble to express how hopelessly wet we were, so what's the use? The third member of our party had fled to a farm house for shelter, and was just as dry as we were the opposite.

That Solo Endurance Test.

Still it rained, and they began to give me all sorts of advice about the way home. It was twenty-five miles in a straight line, but they insisted that I take a roundabout route, much longer, but which (according to them) would give me decent roads.

When I attempted to start out, I made the pleasing discovery that my rear tire was soft—tires always pick out the worst possible times to get soft, anyway—but I squatted there in the mud and got busy. At last I was off. I began by riding the ridge of mud between the two aforementioned canals, and as my tires had seen so much service that their anti-skid knobs were worn down flush, you can easily imagine some of the acrobatic performances my old tub went through. The nimble chamois that spends his spare time leaping from crag to crag in the Alps would have been hopelessly out classed by that twin of mine.

And still it continued to rain. Occasionally a young river had taken a notion to wander across the road, and I would splash into the channel with a hiss, as the water flew all over my machine. I couldn't wear my goggles, for the rain drops on the glass made it too difficult to see, and it seemed to me that a big amount of the mud thrown up by the front wheel found it way into my eyes. I was getting my endurance run, with interest.

The Clutch a Life-Saver.

My clutch was what saved my life; I don't believe any machine could have gone through those roads without a free engine. I became so expert at making lightning grabs for the clutch handle that I could do it without even looking. There was only one hill that I didn't

"I was so travel-stained that they refused to answer me or open the door."

ride up, and that was hopeless. In spite of all my efforts the machine threw me off when we were half way to the top, and the hill was so steep and the mud so deep that I didn't care to race the head off my motor in attempting to start. I walked beside the machine, managing the clutch with one hand and the throttle with the other, and let the motor do just enough work to pull the outfit up.

My time was nothing to brag of, and I found that ten miles an hour was good traveling for such roads. The motorcycle was soon a sight, for sand and water were splashed over every inch of its surface. The belt suffered most; it was simply soaked with water, and the leather became so soft that hundreds of tiny rock particles were embedded in it. That seriously damaged the front pulley lagging. When I left home the slots were still visible in the screws which held it to the pulley, while after my trip even the screws were ground down until not a sign of the heads was showing.

Of course, since it was absolutely an unexplored country to me, I found it necessary to ask more or less frequently about the road, and you may be sure that by that time I was a pretty tough looking customer, with

the mud all over my face and clothes. In one place the road forked at the foot of a big hill, and I stopped to make inquiries at the nearest house. I knew people were home, for I saw someone through a window, but all my poundings at the door awaked no response. Doubtless they sized me up from within, and were unwilling to take a chance on my character. Finally I gave up, and secured the necessary information at another house.

The rain that afternoon was quite peculiar; it seemed to spread over the region in narrow belts. Several times I nearly escaped from the rain belt, and began to congratulate myself that the worst was over, only to meet another soaking down-pour. It developed into a continuous performance, and once the rain was so bad that it drove me off the road to seek shelter in a friendly barn.

On Macadam at Last.

I knew that when I arrived within eight miles of home I should strike a new macadam road, and the thought of how joyous it would be to drive again over a solid foundation kept my spirits up through the worst of it. So I pounded onwards, skidding from one side of the road to the other, and acquiring a vast amount of valuable experience in mud-plugging. Even at my slow pace I made better time than most automobiles; not one of the four-wheelers passed me going in my direction, while I managed to slip by several.

The worst bit of all came just before I struck the new macadam, for the road was broken up for some distance in preparation for a coat of crushed stone. It was full of holes, and the holes were all full of water. There was considerable auto traffic through that section, and the heavy cars had apparently bumped the bottom right out of many of those holes. I never could tell how deep one was until I struck it.

When I was at last speeding over that rounded, well-drained macadam surface, my troubles indeed seemed to be over, and I opened the throttle to forty-five miles for the pure joy of "hitting it up." My hard luck jinx was still to be reckoned with, however, for when I was yet five miles from home, the back tire went flat again. It was almost dark, and I didn't feel exactly in the mood for fixing a puncture, so I decided to call it a slow leak and try to get home on one pumping up. I did it, but the tire was soft when I finally pushed the machine into its quarters.

The ride after leaving my friends was surely a tough one—forty miles in about four hours—but when it was all over, I felt glad for the experience. In the whole day I had not the slightest suggestion of any mechanical trouble.

"Don't be alarmed:
he has WEED
CHAINS too!"

Oh!

NECESSARY FOR THE MOTORCYCLE - AS THEY ARE NECESSARY FOR THE AUTOMOBILE

Necessity is the Mother of Successful Invention

THE insistent demand for a Motorcycle Anti-Skid Chain proved to us that it was a *necessity*. We have therefore produced **Weed Anti-Skid Chains for Motorcycles**—just as perfect in principle, construction and workmanship as **Weed Anti-Skid Chains for Automobiles**, which are so recognized as a tested, tried and time honored necessity that we are now *manufacturing and selling over forty miles of Weed Chains every day in the year*.

Weed Anti-Skid Motorcycle Chains

With the "Creeping Grip"

Give perfect traction, *prevent skidding and slipping*. Make motorcycling absolutely safe—sixty miles an hour—with perfect safety—make *all roads good roads*.

The continuous "*creeping*" prevents injury to the tires and keeps them clean, minimizing the chances of punctures.

The secret process of hardening the *the cross chains*, just adopted, gives extreme lasting qualities.

Easily carried, as the small bundles they make in their canvas bags take so little room that they could be carried in your pocket, when not in use, without inconvenience.

Order them from your dealer or write us direct for full particulars.

THURSDAY

OCTOBER 31, 1912

Entered as second class
matter July 6, 1908, at
the Postoffice at New
York, N. Y., under act
of Congress, March 3,
1879.

H. N. CONDUCT,
Secretary

THAT there are many desirable forms of competition for motorcycles, aside from those which imply simply the utmost in speed, is a fact that has been slow to sink in on this side of the Atlantic, but it is now being hinted that the season of 1913 will find manufacturers and riders in a receptive mood for something more than the tests involved in saucer-spinning and ordinary road work. Our field can ill afford to sacrifice any of the interest that has been aroused in these branches of the sport—and it is far from the writer's intention to disparage them as breeders of enthusiasm—but the student of conditions will be forced to admit that there are other trials, easily arranged and less costly, from which the American motorcycle at its present stage of development would derive more practical benefit. Our endurance runs and reliability tests have headed us in the right direction, but in the past the personal element in these contests has invariably been enlarged upon at the expense of the motorcycle.

IN an endurance contest, for example, the riders who adhere to the running schedule and finish within the time limit are credited with perfect scores, but seldom if ever is there an official report on the condition of the fittings and motor parts of the machines to which awards are made. The fact that remarkable performances have been given under most trying circumstances simply strengthens the argument that such technical data as is referred to, collected at the close of the test, would be of wide interest and practical value. Now and then a perfect scorer would be called upon to put up with a harsh report relative to the condition of some of his fittings after a long grind, but in doing so he would be helping to pave the way for improvements that would ultimately eliminate the harsh report—or at least temper it considerably. It is interesting to learn that several machines have successfully ploughed through hundreds of miles of mud and clay, but information as to how individual fitments stood up under the strain would make even a wider appeal.

GETTING back to the value of tests other than those which call for extreme speed, it is interesting to note that of late British motorcyclists have been giving considerable attention to non-oiling experiments. That no feature of the motor two-wheeler is deserving of more exhaustive study than the lubricating system goes without saying, and trials to determine the best oiling policy and the most efficient method of lubrication cannot fail of

helpful results. In a recent non-oiling test the rider of an English machine gave his motor half a pumpful of the lubricant and then carefully noted the distance covered and the behavior of his mount as it made the most of its limited oil supply. This is referred to merely by way of proving that there is practically no end to the variety of motorcycle tests, and in nearly every instance it is possible to inject the element of competition.

THAT an economy trial, a hill-climb, a brake test, a non-oiling competition, or any one of a dozen other possible contests open to motorcyclists, will not afford the spectacular features of board-saucering and road racing is obvious, but it would seem that the time is ripe for more serious consideration of practical results by American riders. Let us have the 90-mile an hour whirls on the big bowls, with reasonable precaution exercised, and give us general road work—plenty of it—but let us also have a keen eye open for those less sensational programs which make a practical appeal to the prospective rider, put designers on their mettle and exert a more direct and constructive influence upon machine developments.

THERE are indications that many speedsters who have been instrumental in developing board-track racing to its present stage will be missing from the big bowls when the 1913 season is opened—due to an influx of young riders who are careless, to put it mildly, in their financial arrangements with track managers—and in this tendency there is a menace which promoters should not be slow to recognize. The veterans assert, and not without justification, that the field is in danger of being over-run with youngsters who are willing to jeopardize their necks for little or nothing, and that experienced racers cannot be expected to accept the uncertain methods of payment thus established. What is more to the point, they do not care to assume the risks incident to competing with unseasoned riders who are drawn into the game primarily through love of excitement.

A SOLUTION of the problem thus presented to board-track promoters is not within the scope of these paragraphs, but that there is a problem, and one of vital import, cannot be denied. If inexperienced young riders are permitted to under-figure the veterans to such an extent that the latter are driven

from the bowls there is certain to be a lowering of racing standards and a day of reckoning. The writer holds no brief for the seasoned campaigner who makes unreasonable demands—financially or otherwise—but he does believe that every racer fit to compete on a saucer track should receive a fair return for his hazardous work. If he is not fitted for such exacting competition he should not be engaged, no matter how cheaply he may rate his services.

HARROWING reports of a recent motorcycle race in Williamsport, Pa., in which one girl rider was fatally injured and another seriously hurt, have moved F. A. M. officials to thankfulness that this contest was not held under a Federation sanction, and that no similar competition can be conducted with the approval of the national body. The F. A. M. states unequivocally that women riders shall not figure in competitive events, and its stand in the premises could not have stronger backing than is involved in the Williamsport affair. From time to time influence has been exerted to have the Federation officials countenance a race for women riders, but always without avail; such contests are invariably held on an outlaw basis. It is regrettable that human lives and the dignity of a sport must occasionally be sacrificed to the frenzied craving of a few promoters for spectacular programs, but it is also reassuring to know that American motorcyclists as a body are set sternly against such practices—and that they will remain so.

IT is on these crisp post-summer days that Nature exerts herself most fascinatingly to entice the motorcyclist away from bare pavements and walled-in streets to the open road and the golden-tinted countryside, and he is an indifferent rider indeed who can ignore the call. An hour in the saddle will now bring any city dweller to districts where each patch of woodland is radiant in the royal toggery of Autumn—but this will not last long. Each moment is precious. Trundle out the faithful mount and make the most of the country roads in your territory, and do it today. Don't bother about a long rigamarole of conventional preparations; just tune up, climb into the saddle and slip away into the big outdoors. *Tempus fugit!*

HERBERT E. JOHNSON, of Latham, N. Y., writes an interesting account of a 1,000-mile motorcycle tour through New York, New Jersey and part of Pennsylvania which he recently made with Mrs. Johnson as a tandem passenger. Although hills and considerable sand were encountered, the machine gave no trouble and the outing proved entirely successful. Mr. Johnson deals with his experiences as follows.

For some time my wife and I had looked forward to the trip I am about to describe, and we were jubilant when the time finally arrived to start. Our equipment consisted of an Indian seven with Simplex tandem attachment and home-made handlebars. We also carried an extra tube for emergency, as well as sundry patches, cotter-pins, nuts and other small parts. Across the handlebars was stretched a piece of webbing that acted as a cradle for our suit-case, the latter being held in place by straps.

We left home on the first day of September and took the Troy-Schenectady route to Troy, proceeding thence to Pittsfield over a fine road. It was the coldest morning of the early fall and threatening clouds hovered over us, but we reached the Wendell Hotel just before rain fell. After stopping over for twenty-four hours, we headed for Springfield, the rain having ceased. The going was bad, but it did not hinder us from enjoying the trip and the beautiful scenery. On the top of Jacob's Ladder a heavy mist enveloped us, and this kept up all the way to Springfield, where it developed into a hard rain. The storm continued until noon of the next day, when the sun peeped out from behind the clouds and we were on our way again. Before leaving, however, we visited the Hendee plant, where we were cordially received. We left Springfield for Hartford and had fine roads with the exception of a bad stretch about a mile out of Long Meadow. Here we had the first real sunshine since leaving home, and the roads continued good through a district of beautiful scenery to Middletown and New Haven, where we spent the night.

A Run Across New Jersey.

The next morning we continued our trip, stopping at Bridgeport, where our good roads

ended. From this place the route was in fearful shape; in some places we were obliged to walk or go into a ditch; but as all things come to an end, so did this road. Pelham Parkway restored to us our former optimism. From New York we crossed the ferry to Fort Lee and took the road via Englewood and Hackensack to Paterson, N. J., where we spent a few days with relatives. Tuesday morning, bright and early, we left Paterson en route to Somerville.

The roads were in good condition until we were just outside the city limits of Newark; here we struck some ruts and met the worst of all motorcycle enemies, Mr. Wire Nail, who delayed us the best part of two hours. This was our first and only puncture. When we arrived in Somerville that night we were very tired and ready for bed. The next morning, after passing through Duke's Park, a very beautiful estate, we set out for Philadelphia. We stopped at several towns along the route and arrived in the Quaker City about 5 p. m. The next few days were spent in Philadelphia, enjoying the good roads, especially those in Fairmount Park.

On the Homeward Trip.

On Friday, September 13, we crossed the Delaware to Camden and followed an excellent road direct to Atlantic City, where we remained a few days sight-seeing. Monday morning found us ready to start northward. We had good roads all the way to Lakewood, where we stopped for dinner. We then pushed on to Point Pleasant and up the coast to Asbury Park. We had expected to spend the night there, but finding good roads and our machine being in fine order, we rode through Seabright to Red Bank and remained there till morning. We got an early start the next day, but had poor roads the entire distance to Perth Amboy. From there to Paterson the going was splendid and we made up for lost time. Rain delayed us several days in Paterson, giving us a chance to rest and see the sights we had missed on the outward trip. Saturday brought clear weather again, and we were glad to take the road.

The going was good almost the entire distance to Newburgh, where we stopped for dinner. The mountains were very beautiful and were quite a relief from the flat country of

southern New Jersey. At Newburgh we crossed the Hudson to Fishkill and thence proceeded northward over excellent roads, through Poughkeepsie and Hudson to Kinderhook. We spent the night at the latter town. On Sunday morning we started the last lap of our trip. Leaving Kinderhook we traveled over four miles of sand to reach the State road. This good road took us direct to Rensselaer, where we crossed the Hudson again to Albany. Our home is only six miles above Albany, and I will leave it to the reader's imagination to guess how soon we were at our front door. Three weeks had elapsed since the start and we had had a most delightful and invigorating trip. Our cyclometer showed 1,000 miles for the outing.

JERSEYITE OFFERS REWARD.

H. RAUER, of 193 Belmont avenue, Haledon, N. J., reports the theft of his 1911 7 h. red Indian. Its equipment consisted of Prest-O-Lite tank, large brass headlight, square tool box on Indian luggage carrier, Brooks saddle; chain idler on right side, extra needle valve on carburetor jet, leather bumper on top of spring fork; cyclometer and watch on handlebars. An Empire tire was fitted on the rear wheel and a G. & J. on the front. Mr. Rauer offers \$50 for the machine's recovery.

CARD SYSTEM SUCCESSFUL.

MOTORCYCLISTS in Marietta, Ohio, are now using the identification card system in their dealings with the local police, and to date it has given satisfaction. When a member of the Marietta club is arrested for any offense, excepting a felony, he produces a card which identifies him as a member in good standing of the organization. This card is accepted as a bond for his appearance in court, the club standing responsible. The system has been operated in a number of large cities for some time past.

FAILED TO RETURN MOUNT

DE GRUCHY & GORRELL, of Columbus, Ohio, dealers in bicycles and motorcycles, report the loss of a Thor IV, painted blue, with license number 809 and engine K725. The machine was rented out to a young man who said he would return it in an hour, but when he had not appeared six hours later the case was reported to the police.

A ONE-PUNCTURE TRIP.

L H. BARKSDALE recently completed a trip to his home in Laurens, S. D., from New Orleans, via Montgomery, Atlanta and Greenville. The distance was 1,800 miles and the trip was made without an accident and with only one puncture.

WOLTERS QUILTS RACING GAME.

AS a result of his recent and only accident on the track, Joe Wolters has decided to quit the racing game. "I'm going to stop," says the speedster, "before it is too late."

BASIL WATSON, of Chicago, was the second motorcyclist on his way to the Pacific coast to report in Phoenix, Ariz., in one week, the other being Nelson L. Moulton, of Kittery, Me.

FRANK ROBINSON, a school commissioner at Coldwater, Mich., has purchased a motorcycle in order to save time on his inspection tours of the schools.

On this page appear the Indian Riders who make up Chief Nuebling's squad in Reading, Pa. The photograph from which this lay-out was prepared was taken at the start of a recent outing. The white cross in the upper picture indicates Nuebling and wife with sidecar outfit.

HOW I TAMED A SECOND-HAND MOUNT

• DWIGHT • B • PANGBURN •

I HAD always wanted a motorcycle and when two or three friends bought machines and allowed me to try them I immediately saw that I could no longer do without one of my own. Still the prices of new machines like those of my friends were too much for me, so when I chanced on a man who wanted to sell one less than a year old and "as good as new" at less than half price, I purchased it at once.

The next morning I had my first trouble. I found the rear tire flat. Taking the tube out I looked it over carefully. There were four patches on it. I could find no leak anywhere so I began to use my head and it occurred to me that the valve might leak. I tested it and found that it leaked badly. There was no other leak and I had had the trouble of taking out the tube all for nothing. A little later the four patches came loose, one at a time, and had to be replaced. On questioning the original owner he said he had put those on shortly before selling the machine to me, and had been in too much of a hurry to wait the proper length of time for the cement to dry before applying the patches.

Solving a Leak Mystery.

The first of these patches sprung a leak after I had had the machine about three days. It was an unusually hot day and I had run at good speed over an unshaded, oiled road for several miles. I was ten miles from home and it was nearly dinner time. Taking out the tube I found a patch was leaking, apparently having become too hot. I took off the patch, which was quite a large one, and found I had no other big enough to take its place, so I had to clean it to use again. I put it on and pumped up. As long as I pumped the tire stayed hard; when I stopped pumping it grew soft. Finally I started to take the tube out again and found another patch leaking. I put a new one on and pumped up again, but with no better luck. By this time the rubber connection on the pump had worn so that most of the air leaked out at the ends instead of going into the tire. I had nothing in my kit to fix it with so I walked 200 yards to the nearest house and got some twine to tie the ends up with. It was a mighty poor substitute, but better than nothing. So nowadays you can't find me without wire in my kit—and I've helped lots of other fellows with it too.

Both these times I had taken the tube out everywhere except at the valve stem, and as it still leaked it at last entered my head that there might be trouble in that little section of tube about six inches long that I couldn't see.

So I fished it out—and found a glass puncture about one-sixteenth of an inch long, just big enough to let the air out as fast as I put it in. It had taken me exactly three hours to get the idea that I might have two leaks at the same time. Ever since that day I have taken the tube out all the way round.

How a Novice Started Trouble.

I had found by comparison that my machine did not ride as easily as those of some of my friends. While riding with one of them I heard him complain that every time he struck a bad bump his saddle "hit bottom." As he weighed 25 pounds more than I and I never hit bottom on his machine, it gave me an idea, and I suggested that we trade the bottom coil springs under our saddles. We examined the springs and mine seemed stiffer, so we made the exchange, after which I rode as easily as anyone and he hit bottom no more.

For a hundred miles everything ran smoothly. No hill was too steep for me, no grade too long, no other machine of my class could touch me on the level. Then I met a friend who wanted a ride. "Just out to the end of this good piece of road, y'know." He had never motored much, but it was only a mile and a half each way, and in a moment of weakness I yielded. My model being behind time I had no clutch. He started with the belt rather loose and I yelled at him to tighten the idler. When he reappeared after some time the engine was smoking like a pile of wet leaves and he wanted to know what was the matter with the old tub, anyway. Said it wouldn't go over 20 miles an hour. He had not tightened the belt and had consequently burned off every thread of the canvas lagging on the pulley, also injuring the belt on the lagging screws.

Attaching Pulley Lagging.

I immediately got some leather belting for pulley lagging. I put a piece of paper around the pulley and marked the 8 screw holes on it. Laying the paper on the leather I cut the holes and counter-sunk them. Then I tried to put the lagging on. I had not reckoned on the fact that the leather was some 50 times thicker than the paper and a lot of it would be taken up in bending, so when I started with two of the holes right the other six were wrongly placed, the worst being nearly $\frac{3}{8}$ inch out of place. Thus I discovered that the only way to put the lagging on right was to put in the screws at one end and then wrap the lagging around the pulley and pound it, preferably with a ball peen hammer, to stretch it and locate the holes for cutting. A patent

buckle strap put around the lagging and pulled tight was a great aid in holding it in place while putting in the screws.

The morning after my lagging was fixed I started the engine and found that instead of running smoothly as it had done before, it would fire four times and miss twice, repeating this sequence exactly. By testing I found the magneto was producing a spark just 4 times out of every 6 times it ought to. Then I began to examine it. I cleaned it as well as I could, including the carbon brushes. It was no better. I decided to take it to the agent. He and two or three other motorcycle men saw it and worked over it during the day. When they had finished it was firing 3 times out of 6 and missing the other 3, and would only just carry me on the level. I started for home, and on the way it got to sparking only 2 times out of 6 and would no longer carry me by itself, so I had to pedal to help it, fortunately only a short way.

Doctoring a Cranky Magneto.

Forthwith I wrote to the makers of the magneto, asking to have their trouble man tell me what was the matter and explaining the situation in detail. They replied that they had carefully noted my letter and that if I would send the magneto to them by prepaid express they would endeavor to tell me how much it would cost to have it fixed. I don't know whether they knew what the trouble was, but at any rate they gave me no information—not even an instruction booklet which I asked for.

Not relishing such treatment from the manufacturers I determined to find the trouble myself. My first step was to examine another machine of the same make as mine and compare the magnetos carefully. Having done this I saw that my platinum points were set too far apart. I moved them closer together—they were already clean—and the motor ran perfectly. To use the proper expression the magneto had been "breaking too high," but the makers couldn't seem to guess it. Since then I have had the same trouble again by having one of the points work loose, and it has always yielded to the same treatment; setting the points closer together.

Learning a Timing Lesson.

During the work with the magneto I had taken the cover off the gears and started the machine that way. The idle gear quickly jumped out and spoiled the timing. Instructions for timing usually say to put a wire through the priming cock at the top of the cylinder and find when the piston is at the top end of its stroke. At least they always

tell how to set the magneto after one has determined when the piston is at the top of the compression stroke. But my cylinder has no priming cock and the head and walls are one casting, so I couldn't find what I wanted by taking the head off. Besides I had no instruction book to go by.

Finally I thought out the system that follows, for timing the spark without taking the engine apart in any way or sticking any wires in it. This system works equally well with singles or twins, and depends on the fact that the exhaust valve closes at the exact instant when the suction stroke begins. That this must be so is evident, since if the exhaust valve were to close earlier there would be some compression, which would both slow up the engine and delay suction, causing a scant charge to be drawn in; and if the exhaust valve were to close later some of the waste gases from the exhaust pipe would be drawn back into the cylinder.

But the suction stroke begins at the moment that the piston starts away from its highest position in the cylinder. Therefore at the moment when the exhaust valve is just closing the piston is just at the top of the cylinder.

A Successful System.

Bearing these facts in mind I proceeded as follows. I turned the engine over until I saw by the downward motion of the valve stem that the exhaust valve was just closing. Next I made a chalk mark on the pulley rim, at the top of the pulley to correspond with the piston, which I knew was at the top of the cylinder. I knew also that the engine must make its suction and compression strokes before it was ready to fire, so I released the compression and turned it one complete revolution, until the chalk mark was at the top again. I was aware that the limit of advanced spark is to have the spark take place about one-fourteenth of a turn before the piston reached the top of the cylinder; that is, to have the spark 25 degs. ahead of the piston and take place when the piston is thirteen-fourteenths of the way up the compression stroke. So I set the spark control at full advance, made another chalk mark on the pulley 25 degs., or about one-fourteenth of the circumference, ahead of the other mark in the direction the engine turns normally (shown in Fig. 1) and then turning the pulley back so this second mark was at the top (shown in Fig. 2), I replaced the gears in such a position that the platinum points on the magneto were just parting. On trying the engine I found that it ran very well, but would not run on full advance spark satisfactorily. Moving the gear just one cog so as to retard the

Fig. 2.

spark fixed this and I have never had to change the timing.

An Excellent Service Record.

A story of troubles is hardly complete without mention of carburetor trouble. When I got the machine it was running well. I made careful note of the settings of the air and gas valves. The only carburetor trouble I have had in thousands of miles of riding was once when the adjustment was changed without my knowing it. The trouble was fixed in five minutes by turning both adjustments down tight and returning to the original position. This experience has led me to believe that a great part of carburetor trouble is due to "tinkeritis." The only care I have ever given mine is to keep it clean on the outside, especially at the air valve, and clean on the inside by straining all my gasoline.

Perusal of the foregoing article may lead one to the impression that I have never had anything but trouble, but just the reverse is true. That I have never had anything but service is a more truthful statement of the case. All these troubles described occurred during the first 300 miles of riding. Since then I have not had to stop on the road for trouble of any kind, including tire trouble, any oftener on the average than once in 500 miles. Considering that I have never replaced any parts, not even a spring or valve, this seems to me like a good record.

FOR GAS ENGINE USERS.

THE Norman W. Henley Publishing Co., of 132 Nassau and 15 Beekman street, New York City, has just issued a new book under the title "Gasoline Engines, Their Operation, Use and Care." The book, which sells for \$1.50, is well printed and contains much information of general value to the user of a gasoline engine. It describes the gasoline engine; its construction and operation; tells how to install it; how to select it; how to use it and how to remedy the troubles encountered.

WANTS MORE MOTORCYCLES.

BALTIMORE, Md.—Street Cleaning Commissioner Larkins has requested the Board of Estimate to grant him \$700 for new motorcycles. His department has several motorcycles in use and they have shown such economy in the conduct of his work that he wants more. The board has become interested in his proposition and it is likely that he will be given the money.

THE Philippine Islands are said to have 360 good motorcycling days in a year.

A MINNESOTA PARTY.

SPEAKING of parties—and most folks are these days—there is a squad of motorcyclists in St. Charles, Minn., traveling under the name of the "Single Track Gasoline Roller Motorcycle Party," and its riders live up to all their opportunities. Doctor F. C. Dolder heads the party and transacts business under the title of Boss of Bosses. The other officials of the squad are also "Bosses," the novel staff being made up as follows: Doctor F. C. Dolder, boss of bosses; Ben Schock, big boss artist; J. A. Anderson, big boss packer; August Bohks, big road boss; Martin Hanson, big shop boss; Rev. Shoewe, big pilot boss; Ben Smith, big Indian boss; J. J. Kadletz, big country boss; E. Englebart, big wrecking crew boss, and Logan Rockwell, big insurance boss.

THE NORTHERN PACIFIC COAST.

RIDERS who have toured the Northern Pacific coast of late report that north of San Francisco the coast affords but few beaches that are easily accessible to motorcyclists. Immediately south of the Columbia River, along the Oregon coast, several stretches of sandy beach are to be found, and the same holds true north of the Columbia River, along the Washington coast. A new road has just been opened from Aberdeen to Cohasset Beach, which connects the Washington beaches with the Puget Sound country, and this section has been explored by a large number of motorcyclists. Cohasset beach is the longest stretch of continuous beach fit for riding on the northern Pacific coast.

SHOWED SHORT GRASS PICTURES.

LAST summer's Short Grass tour was the subject of a recent illustrated lecture given by M. E. Harding and Irwin Keller, two motorcyclists who completed the tour and who took more than 100 pictures. The lecture was given for members of the Topeka (Kan.) Motorcycle Club and other Topekans interested in motorcycling.

WINNER IN DENVER.

MOTORCYCLES and sidecars figured in a parade incident to the annual Mountain and Plain Festival which was held recently at Denver, Col., and the Indian outfit, shown in the accompanying photograph, carried off first prize in its class. The rider of the machine is Arthur Stevens, a salesman for the Indian branch in Denver, and the sidecar is occupied by Mrs. Stevens. The motorcycle section of the parade created an excellent impression and brought the motor two-wheeler into a position of prominence which it had not previously attained in Denver.

Fig 1.

ENGLISH NOTES "BRITISHER"

Legal Bar Against Open Mufflers Causes Trouble for British Manufacturers—A Few of the Latest Refinements—Leading Features of 1913 Models—Armstrong Three-Speed Control—The Wall Auto Wheel, An Ingenious Device.

IN contrasting the performances of Triumph and your Indian, in the Scottish trials, I mentioned too curtly that the Triumph trio did not shine on the hills. In fairness to our trade, I ought to have made it quite clear that whereas the Indian trio were a trade entry of three 7 h. two-speeders, with one man up, the Triumph trio consisted of three self-entered amateurs, one riding a single-gear solo $3\frac{1}{2}$ h. and another pulling his fiancée in a sidecar with a $3\frac{1}{2}$ h. three-speeder. Hence the Indian team were bound to lick them on hills. All in all, the machines gave most satisfactory performances.

A Lubrication Refinement.

WE find that when a high-efficiency motor is worked really hard the slight film of oil flung on the cylinder walls by the fly-wheels is rapidly scorched into smoke. This especially applies to mile spring hill-climbs with very high compression engines, or too prolonged work with a $3\frac{1}{2}$ h. side-car outfit on the 10 to 1 ratio of a three-speed hub. As a consequence some designers who employ pump or drip oiling are taking a special oil-lead to the cylinder walls. The sketch shows how this oil lead is attached to the cylinder of the British Excelsior machine. Inside the cylinder, the piston dips—at the bottom of each stroke—into a circular trough formed round the crankcase cover, which is always full of oil.

Spoiling a Machine's Appearance.

IT is quite plain that our makers as a class are sacrificing beauty to efficiency. The demand for a weatherproof transmission is leading to the general adoption of chain cases. Now, as the cut of many an up-to-date machine indicates at a glance, the old handsome outlines, so laboriously attained, are jettisoned when you slop three huge chain cases onto an otherwise pretty and effective design. You have to protect a magneto chain, a front engine chain, and a back wheel chain. Each normally implies a bulbous, lopsided and generally repulsive blob of aluminum sheeting, and the result may be weatherproof, but looks ghastly. The Lea-Francis people have surmounted the hoodoo as neatly as any actual design I know. They mount their magneto half way between the engine and the

countershaft, and drive it by chain off the crank-shaft, instead of off the cam-shaft, so that its chain lies within the front engine chain case, so reducing the number of chain cases by one. They incorporate a ratio reducer in their gear box, which permits the back wheel chain to have level sprockets, and so dodge the usual ovaloid excrescences. But even thus I notice they cutely had their new model photographed for publication minus its front chain case, which spoils its looks.

The Problem to be Solved.

YOU have to use a large engine sprocket, with plenty of teeth, or wear will be excessive; you have to get a 50 per cent. reduction on the front chain, or the gears will run too fast; and if the public wants this oval running chain fully encased, an ugly cover is next to inevitable. Hence a well-known technical writer suggests that the trade might do well to experiment with an enclosed shaft drive to the countershaft, as the primary unit of both chain drives, and belt-cum-chain drives. It remains to be seen whether any designers will adopt the suggestion. But it certainly offers the chance of a presentable weather-proof transmission, and with adjustments for the bearings and the meshing it should wear at least as well as a front chain.

Open Mufflers Barred.

OUR Local Government Board has at last absolutely forbidden the use of the open muffler. The wording of the new regulations is rather curious, and it is evident that excessive noise will be the basis of the prosecu-

tions which are sure to follow. It is now illegal to ride in Great Britain or Ireland a machine which affords any outlet to the gases prior to their entering a muffler or expansion chamber. In addition we are prevented from running the exhaust gas down a pipe into a sealed muffler devoid of baffle-plates, and then out into the air, for a further regulation penalizes a noisy machine, irrespective of its constructional details. These rules will make the trade exceedingly busy, as some of our best machines cannot be run long distances in hot weather unless the muffler cutout is open at present.

An English Type of Front Wheel Stand.

Frontwheel Stand.

ALL high-class British machines are now provided with frontwheel stands, designed to facilitate repair of the front tire. The cut shows a typical example. The legs work on stub spindles brazed to rear extensions of the fork tips; a shoulder on each lug prevents the stand working more than a degree or so forward of the vertical, and a clip on the tail of the mudguard holds the stand securely, when it is out of use.

Manufacturers in Trouble.

SOME of our manufacturers have already prepared large stocks of 1913 mufflers which are now illegal, and they are simmering with helpless indignation. The general opinion amongst expert roadmen is that danger to the public has been vastly increased for a motor-bike is so small that a pedestrian does not readily sight it, and thousands of accidents have doubtless been averted by our engines making a reasonable noise.

Our Tire and Belt Drives.

CAREFUL official tests of specially entered belts and tires were incorporated in the recent 1,000 miles endurance run, and the judges have issued a portentous report, in which a very little wool and a deal of wadding figure. Entries were not representative in either case, and the absence of comparative chain tests would in any case have robbed the belt tests of much interest. I may briefly sum up the results by saying that rubber belts beat

Douglas Motor, of the Type that Won the 1912 Tourist Trophy.

leather belts all ends up; that although manufacturers often sell their $3\frac{1}{2}$ h. machines with $\frac{3}{8}$ -inch and even with $\frac{3}{4}$ -inch belts, yet for trial purposes practically everybody used 1-inch belts, and these large section belts mostly emerged with fair credit; that the tire prize was won by a set of 3-inch cord tires, fitted to a side-car outfit, which were in literally new condition after 1,000 miles of bad roads; that many sets of $2\frac{1}{4}$ -inch tires came through superbly, but that in most cases the treads fitted to the under casing were heavier than are supplied at catalogue price terms from manufacturers' lists of complete machines. The oddity of the trial was that several tires grew steadily heavier in wear, showing that some types of cover are spongy and improperly waterproofed; nothing but absorption of water could account for this increase in weight, as the riders were careful to extract grit, and the tires were washed and rubbed before submission to the judges.

A Three-Speed Gear Control.

THE next cut shows the simple lever and quadrant utilized for controlling our epicyclic hubs. The sketch practically explains itself. There are three notches for the three gear positions, and the hole is intended for

adjustment purposes. The movement of the internal control bar of the hub is extremely short, and the tiniest wear upsets its operation. To adjust the hub, the short screw shown in the head of the lever is inserted through the hole in the quadrant, and the screw-link of the external control rod is then adjusted until the wheel spins free. The control is then correct. Notice the sturdy lugs, brazed to the top tube of the frame, which carry the lever and quadrant.

Leading 1913 Features.

A NUMBER of next season's models are now on exhibition to agents and journalists, and a few leading features of development can be identified with certainty, as follows:

1. The "combined drive" is gaining ground rapidly against belt and chain drives. In every instance the primary item of these twostep transmissions consists of a chain from the engine to the bottom bracket countershaft; the sprockets usually afford fifty per cent. gear reduction, and the engine sprocket embodies a slipping device or spring cushion; the chain is fully encased in a light aluminum cover, dust and waterproof. On the countershaft, which may or may not form part of a gearbox, is mounted a large metal belt pulley, varying from 6 inches to 8 inches in diameter; the final drive from this pulley to the rear belt rim is, of course, by belt. If there is no gearbox on the countershaft, the rear hub contains an epicyclic gear, generally a three-speeder, but in isolated cases a two-speeder.

Variable Gears Paramount.

2. Variable gears are literally universal. The three-speed countershaft gear, whether of the sliding or epicyclic type, is represented by very few examples, unexpected difficulties having hampered the designers; a strong, light gear of this design is not easily arrived at, but most engineers are working in this direction for their ultimate ideal. At the moment the most popular gear is the three-speed epicyclic hub, embodying a multiple disc free engine clutch. The original design has largely been discarded, and the popular types of three-speed hub drive solid on their top ratio, attain the bottom gear through the reduction of two pinion trains, and permit of the engine being started with the back wheel on the ground. Kick starters are fitted in preference to pedalling gears.

3. The decompressor is a popular fitment on the best engines; it greatly reduces the amount of energy required to operate a kick starter.

4. Sliding two-speed countershaft gearboxes are fairly numerous, but figure chiefly on machines sold with an eye glued to the side-car market. In this case the drive is usually by chain throughout.

Other 1913 Details.

5. Detachable wheels, on the lines recently illustrated in this department, are likely to be standardized in the near future, though many firms have not yet decided whether to evade the patents, or to pay royalty.

6. Weatherproof finish is growing popular, though it is not yet consistently applied. Very few machines will be "all black"; but the number of plated parts is being sternly cut down, and accessories, such as lamps and horns, are being blacked.

7. The $2\frac{3}{4}$ h. engine, in conjunction with a variable gear, is being turned out in very large numbers, and will be a very serious competitor with the $3\frac{1}{2}$ h. types. Many firms do not trouble to list models exceeding 350cc. engine capacity.

8. Automatic and semi-automatic carburetors are gaining ground. Tap-twiddling is abhorrent to the unmechanical type of customer who rides for the sake of cheap locomotion rather than for sport. At present the genuinely automatic vaporizer is less popular than the type on which the air lever is only used for starting purposes, and flung wide open as soon as the engine fires.

The Wall Auto-Wheel.

FOR years past British motorcycle engineers have been trying to produce some sort of gasoline jigger which could fill the bill for the man who has only fifty dollars or so to expend. The only attempt which achieved any success in the past hailed from Switzerland, the well known Motosacoche, or "motor in a toolbag," produced by the famous Dufax brothers at Geneva. The Dufax Freres have long since abandoned their original ideals, and now confine their attention to aeroplane and powerboat engines, and to a lightweight $2\frac{3}{4}$ h. machine, with variable gear, built on full roadster lines throughout. The gap they have left in supply has been filled by an Englishman named Wall, on rather novel lines. Instead of clipping engine tanks, beltdrum, etc., within the frame of a pushbike, he attaches a ballbearing castor-bracket to the rear forks and chainstays, and from this bracket he trails what he calls an "autowheel".

Details of the Auto-Wheel.

The autowheel weighs 34 lbs. complete, and has a fourstroke engine of 52mm. bore x 54 mm stroke, with miniature magneto, and automatic carbureter. The engine is mounted on the outer of the two horizontal tubes which encircle the autowheel, and drives the hub of the autowheel by chain. A lubricant reservoir is mounted on the back of the crankcase, and feeds it on the canary fountain principle; the gasoline tank is mounted on the top of the autowheel's mudguard. An external flywheel of light weight but large diameter steadies the engine. The controls consist of two levers, valve-lifter and throttle, both mounted on one clip, which is easily attached to the handlebar of the pushbike, and operate the vital parts of the autowheel by means of flexible wires. The attachment has been undergoing road tests for two years past, and the initial difficulties seem to have been adequately surmounted. The 34 pound wheel appears to have all the roadgrip essential to propelling its light load. It can drive a 140 pound rider, on a 35 pound pushbike at twenty miles an hour; greater speeds would occasion excessive vibration with a light machine on small tires. Its hill-climbing capacity is extraordinary.

Two Views of the New Wall "Auto-wheel," One Showing It Driving a Bicycle with Two Passengers.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.
6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.
7. At least one dollar will be paid for every suggestion published.
8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

THREE-SPEED GEAR.

A THREE-SPEED bottom-bracket or counter-shaft-mounted gear, with selective control is suggested as satisfactory for use on passenger and solo mounts. The chain from the motor sprocket leads to the clutch body J, on which is mounted a sprocket. The clutch shaft is prolonged through the gear box and is squared. two sliders with pin-teeth (A and

UNIT POWER PLANT.

THE crankcase in this unit power plant houses the two-speed gear and clutch as well as the flywheel, crank and crank-arm. F is the crank-pin, G the single flywheel, and H the gear driving the valve train. On the extension of the crankshaft is keyed a set of gears A and C, which are in constant mesh respectively with gears B and D on the countershaft. A clutch or other device J enables either of the gears B or D to be clutched to the countershaft and thus drive the machine by a chain over sprocket K. The high speed is through gears C and D, while the low speed is through A and B. Contributed by C. W. Bergman, Alpine, Mich.

OVERHEAD VALVE LIGHTWEIGHT.

THIS is a 2¾-inch bore and stroke motor with overhead valves actuated by an overhead cam-shaft driven by chain and sprockets from the main shaft. There is an outside flywheel, and the drive sprocket is on an extension of the flywheel shaft. The timer, for battery ignition, is fitted on the end of the cam-shaft. From the drive sprocket a chain runs forward to a counter-shaft, the final drive being by V-belt. The shape of the frame and tanks is distinctive, as is the spring fork. Contributed by B. S. Mackernan, Chicago, Ill.

Overhead Valve Lightweight.

B) being mounted on this squared portion. Loose on this shaft are gears C, E and G. Meshing with these are gears D, F and H, which are fixed on a countershaft. To C is attached a sleeve which surrounds the clutch shaft and carries the final drive sprocket K on its outer end. Each gear on the clutch shaft is pierced with holes to accommodate the pin teeth on their respective slider. Thus slider A has its teeth entering into gears C and C, while slider B has its pin-teeth fitting into G. The holes are shown in the section of gear C. For the high speed, A is moved so that its teeth engage with gear C. The drive is direct from J to K, the shafts being locked together. For the second speed, slider A is moved to engage gear E; the drive is through clutch shaft, gear E, gear F, gear D and gear C to sprocket K. For the low speed, slider A is in neutral, and B is engaged with gear C. The drive is from clutch shaft through gears G, H, D and C to the sprocket K. All gears not engaged on the clutch shaft run idly. The ratios are: High, 3:1; second, 5:1; low, 7:1. The gear change and clutch levers are mounted within a sector of the selective type on the frame of the motorcycle. The clutch lever is at L and the gear change lever at M. When M is moved into slot 1 the low gear is engaged, and when placed in slots 2 and 3 the second and high are respectively engaged. Contributed by Phillip L. Allison, Burson, Cal.

Improved Motorcycle.

THIS embodies a tank-frame construction. The gasoline tank has balanced pillar apertures, one for the filler and the other for the garage, on each side. The tool box is in the usual rear position and has a place for each tool. The muffler is of special shape and located in rear of the seat mast. The rear construction rocks about the crank-hanger, the springs being mounted in the upper frame. The long inlet pipe is another distinctive feature. Contributed by Harold Shoemaker, Schenectady, N. Y.

FISK CO. REINCORPORATED.

BOSTON, October 24.—The Fisk Rubber Company, of Chicopee, which was incorporated under the laws of Delaware, has been reincorporated under the laws of Massachusetts with a capitalization of \$10,000,000, consisting of 50,000 shares of preferred and 50,000 shares of common stock at a par value of \$100. The preferred stock is 7 per cent. cumulative to be given \$100 in case of liquidation and \$115 if redeemed. The incorporators are Harry T. Dunn, Harry G. Fisk and John C. Cole.

DIAMOND CHANGES.

E. B. HUYLAR has resigned as manager of the Milwaukee (Wis.) branch of the Diamond Rubber Company, 132 Oneida street, and is succeeded by R. W. Smith, who comes from Indianapolis, Ind. A. G. Laughner is traveling representative in Wisconsin, with headquarters at the Milwaukee branch.

NEW POPE STRUCTURE.

THE Pope Manufacturing Company, Hartford, Conn., is completing plans for the construction of a four-story factory building, which is to be devoted to the production of a line of lower priced cars. It is said that this structure will double the capacity of the plant.

IS THIS A RECORD?

FAY YOUNG, of Rockford, Ill., claims to have run his motorcycle 18,000 miles without having spent a cent on the motor or having taken it apart. He has never replaced his front tire.

A MOTORCYCLE club was recently organized at Oceanside, Long Island, with 14 charter members. Clubrooms have been secured and Secretary Kramer, 153 School street, will be glad to hear from any riders caring to join.

Spring Frame.

A COACH-SPRING type of rear frame which provides, it is claimed, a rigid support is shown here. The central leaf of the spring is continuous and forms a scroll at each end, the short leaves being clamped on opposite sides. A 4-inch lift of the rear wheel

causes only a 2-inch rise on the springs. A small tank for cylinder oil should be placed below the countershaft to lower the center of gravity. Contributed by S. Cleaves, Cambridge, Mass.

RODE FOR CHICKEN DINNER.

ABOUT sixty motorcyclists, including eight women riders, of Reading, Pa., recently made a run to Earlville, where they enjoyed a chicken and waffle dinner. After the dinner they rode to Boyertown and then returned to Reading.

Motorcyclists of Inman, Kan., are organizing a club and will affiliate with the F. A. M.

ON LONG ISLAND ROADS.

THE necessity for the Brooklyn (N. Y.) riders to navigate through the congested downtown section of New York City, which detracted to a great extent from the pleasure of an up-state trip, has been overcome by the recent improvements which have been made to a number of Long Island's highways, thereby enabling the rider to make interesting trips over good roads on Long Island. Hoffman Boulevard, which lies in a pretty section where one need not fear heavy traffic, has recently been repaired and now affords excellent riding. Another attractive ride is through Cooper street to Trotting Course Lane and thence west to Hoffman Boulevard; or one might go via Jamaica avenue to Forest Park and then along Trotting Course Lane and continuing on Hoffman Boulevard.

THOMPSON TO MAKE CHANGE.

GROVER C. THOMPSON, who for six years represented the Electric Welding Products Company, of Cleveland, Ohio, in the New England states, and who for the last three years has been the company's representative in Ohio and Indiana, will soon take up the duties of manager of sales for the Michigan Electric Welding Company. This firm is contemplating an entrance into the motorcycle field. The company will not exhibit at the coming shows, but will be well represented.

A STOLEN MACHINE.

A REWARD of \$25 is offered for the recovery of a 1912, 6 h. Excelsior twin, belonging to W. T. Metzger, 1767 West Thirty-second street, Cleveland, Ohio. The machine was stolen recently. It has the standard gray finish, license No. 117, motor No. 26,400, tandem seat, Goodyear studded tires and belt drive.

A BULLETIN FROM PULS

GEORGE J. PULS, of the Harley-Davidson road staff, bulletins the factory that he has closed with C. L. Wilkins, 12 West High street, Springfield, Ohio, to handle the H-D products exclusively for 1913. Wilkins was formerly a member of the firm of Wilkins & Grove, and has had wide experience in the motorcycle and bicycle business.

Motorcyclists in Iowa City, Ia., have formed a permanent club.

TOLEDO TOURISTS

THE riders shown in the photograph are members of a touring club of Toledo, Ohio, ready for one of their regular Sunday

club rides. There are excellent roads running out of Toledo for many miles in all directions, and a number of highly enjoyable tours were made by this group during the season now closing.

QUESTIONS and ANSWERS

IN considering the statement of those who participated in contest No. 7, explaining "the operation of the inlet and exhaust valves," it was noted that quite a few contributors sacrificed their chances to capture the prizes by taking too much for granted. There was a tendency to assume that all riders know the valves open at certain times and close at others, and while these operations are too obvious to require specification ordinarily a reference to them was needed to complete a winning statement in this contest. Attention is called to this condition so that contributors will not ignore details in future letters. Several writers took up valve operations very thoroughly, but only for a certain method of arrangement, thus offsetting the value of their explanations. One of the best letters was unsigned and without an address, so that it could not be judged.

The first prize in this contest is awarded to Harry C. Sundgard, 4535 Mulberry street, Frankford (Philadelphia), Pa., and the second award goes to D. J. McLaughlin, 17 Elm street, Ilion, N. Y. Two others receive honorable mention.

The series of contests now being conducted in this department will close with the issue of December 26, and announcement of the final winners will be made in the next issue, that of January 9. Contributors should submit answers to each question as soon as possible after its first appearance so that the work of judging and awarding prizes may be facilitated. All answers, and communications referring to the contests, should be addressed to: "Editor Questions and Answers, Motorcycle Illustrated, 51 Chambers street, New York."

Below are given question No. 8, that for which answers are now being received, and the new question, No. 9. Prize winners for No. 8 will be given in the next issue.

Question No. 8. Describe the action of a three-port, two-stroke motor.

Question No. 9. Which is the most desirable location for the clutch on a belt-driven machine?

FRANK

MERRITT

OPERATION OF VALVES.

(Question No. 7.)

THE first prize in this contest, Question No. 7, has been awarded to Harry C. Sundgard, of Frankford, Pa., whose contribution was as follows:

"The functions of the exhaust and inlet valves are explained by their names. The inlet valve opens to admit the live gas to the cylinder, and the exhaust valve opens to permit the escape of the burnt charge. The cycle of operation is as follows: Starting with the suction stroke, the inlet valve opens as the piston moves down and the live gas is drawn in from the carbureter. When the piston starts up on the compression stroke the inlet valve closes and the charge is compressed. At or near the end of this stroke the charge is fired and under the force of the expanding gases the piston moves down on the power stroke. At the end the exhaust valve opens and the piston, moving up, expels the burnt gas.

"Inlet valves are of two varieties—automatic and positive. The automatic valve opens under the force of suction created by the piston, and closes the instant there is any compression in the cylinder. It is held on its seat by a light spring and opens very easily. The positive variety is opened and closed by means of a cam and push rod, and works either with a direct thrust or through a rocker arm. The cam is keyed to a shaft which is geared to the crank shaft and revolves at one-half crank shaft speed. This cam is so designed as to open and close the valve at the proper times.

"The exhaust valve is always operated by a cam and push rod, the cam being arranged as for the inlet valve. Automatic exhaust valves are out of the question for obvious reasons. In actual practice the inlet valve is timed to open at dead centre and closes at a few degrees past centre. Engineers claim that there is suction even after the piston has started on the compression stroke and the valve is left open to get the benefit of this suction. The exhaust valve is timed to open several degrees before dead centre on the power stroke, in order to get rid of the burnt gases as quickly as possible, and closes at dead centre on the up stroke."

Second Prize.

To D. J. McLaughlin, of Ilion, N. Y., the second prize has been awarded. His answer is as follows:

"Inlet and exhaust valves are used on four-stroke motors. The exhaust valves are operated by gears—that is, mechanically—and this applies to the inlets, unless of the automatic type. In an automatic inlet valve, the suction created by the piston moving downward in the cylinder opens the valve and there is no gearing, a light spring closing it when the suction ceases. The operation of the inlet and exhaust valves are as follows: When the piston starts down on the suction stroke, the inlet valve is opened by a cam driven from the motor shaft at one-half the speed of that shaft. The cam acts on the valve through a tappet or other connection and lifts it from its seat. A charge of mixture is thus allowed to be drawn into the cylinder. The inlet

valve is held open until the piston starts up on the compression stroke, when it remains closed through the other three strokes: compression, firing and exhaust. The exhaust valve is opened by similar devices (cam, tappet, etc.) just before the power or firing stroke is completed and is allowed to close by its spring just before the piston starts to come down on the next admission or suction stroke. Both inlet and exhaust valves are fitted with springs which keep them on their seats when not operated by the cams and gearing."

Honorable Mention.

HONORABLE mention is given to the answers of A. F. Clement, of Mansfield, La., and of George M. Johnson, of 366 Whalley Ave., New Haven, Conn. Clement's answer is here given.

"Inlet valves are of two kinds, automatic and mechanical. In the automatic, the outward stroke of the piston creates a vacuum in the cylinder; this suction draws the valve open and draws a charge into the cylinder. When the piston reaches the bottom of its stroke, the suction ceases, and a spring on the valve draws it to its seat and keeps it there until another suction stroke opens it.

"The exhaust valve is always mechanically operated, and the principle of the mechanical inlet and the exhaust is the same: the valve is operated by a cam on the secondary or half-time shaft; this shaft is run by a two-to-one gear from the crank shaft. The valve opens at the end of the power stroke and closes at the beginning of the suction stroke.

"The nose of the cam on the secondary shaft comes in contact with the push rod and raises it; the top of the push rod comes in contact with the bottom of the valve stem and raises the valve. As soon as the nose of the cam has passed from under the push rod, a strong spring pulls the valve down to its seat and holds it there, until it is again raised by the cam."

Johnson's answer is as follows:

"The valves form a very important part of a gasoline engine, for on their proper operation largely depends the efficiency of the motor. The inlet valves open to admit the explosive vapor, which is then ignited, and the waste gases are expelled by way of the exhaust valves.

"Inlet valves are of two kinds—automatic, or those opened by suction, and mechanical; exhaust valves are always mechanical. For sake of convenience, let us first consider a single-cylinder motor with automatic inlet. To make clear the operation of the valves, it will be necessary to explain briefly the movements of the piston. This travels down twice and up twice to every explosion, or, in other words, makes two complete revolutions to each power stroke. The momentum of the fly-wheel carries it over on the dead stroke. The piston, as it descends, sucks in a charge of gas. This is compressed on the return stroke and then exploded, which drives the piston down, and when it again returns it expels the waste gases resulting from the explosion.

"When the piston descends, at the beginning of the two revolutions that are required to each power stroke, a vacuum is formed in the cylinder. This causes the automatic inlet valve to open, for the spring which closes it is not strong enough to resist the suction force of the descending piston. When the vacuum is relieved by the in-rushing gas, the inlet valve closes. Then comes the explosion, as explained above. The exhaust valve, covering the port through which the exploded gases are driven, is kept closed by a powerful spring. At the right instant it is opened in this way: keyed to the main shaft of the engine is a gear wheel, which through other gears turns what is called the cam shaft. By means of two-to-one gearing the speed of the cam shaft is just half that of the main shaft, so that the latter revolves twice to the cam shaft's once. On the cam shaft is a raised lump of hard metal, called the cam, and this, as it comes around on the revolving cam shaft, lifts the exhaust valve, by means of a straight intermediary rod called the valve tappet. Of course, the exhaust valve is lifted in this way but once to every two revolutions of the engine, just as the inlet valve opens but once to every two revolutions.

"Now the operations of both valves can be easily understood. The inlet is opened by suction caused by the descending piston, and closed by its spring when the vacuum is relieved; the fresh gas is exploded and the piston driven down; when the piston returns, the exhaust valve is opened and the exploded gases driven out. It is highly important that the exhaust valve be "timed" to open at just the right position of the piston; an improperly timed valve will cause the motor to develop little power, or not to run at all.

"A mechanical inlet is operated after the same principle as the exhaust valve. A strong spring is used, and, as in case of the exhaust, the power to open the valve against this spring is furnished by the motor itself. The

inlet valve must also be timed to open at the right instant. In case of a twin-cylinder machine, the same system is followed out, but with a few additional parts and complications, for there are double the number of valves to be operated."

PORTED CYLINDERS.

ALFRED FRIEDLEIN.—There is no disadvantage in having the ports larger than the exhaust valve area, unless you cut them so large as to interfere with the compression of the charge. That is, so large that some of the charge escapes through the ports. Such ports will also take in dust on the compression stroke, in addition. Have the ports oblong and horizontally cut, or round. Drilling the fly-wheels and other parts is an advantage in reducing weight, as are lighter pistons (of aluminum for example), and the direct chain drive is of advantage in reducing friction. A compensating device with such a drive is desirable, and should be fitted on the hub.

For speed work, a spring frame would tend to very slightly reduce the speed of the machine, and rigid frame mounts only should be used. The multi-valve motors mentioned have removable cylinder heads. We cannot give you the diameter of the valves used.

CYCLECAR MAKERS.

J. N. DUMONT.—The Rollo cycle car is made by the Rollo Car Company, Ltd., Conybere street, Birmingham, England. The Bedelia is of French make and is handled outside of that country by the Car and Motor Sundries, Ltd., Croydon, England. The Sabella, an English cyclecar, is made by Sabella Cars, Ltd., 110 Albany street, London, N. W., and the G. W. K. cyclecar is the product of G. W. K., Ltd., Datchet, England. We doubt if you can get any detailed information, blueprints, etc., from these firms, unless you come to some business agreement. However, write them.

Happ M. Mavis and L. J. Strait.—See the answer to J. N. Dumont in this issue.

MEDALS DISTRIBUTED.

AT the last bi-monthly smoker of the Providence (R. I.) M. C., held Friday, October 25, medals were awarded to the participants who finished in the recent Triangle run. The medals were given out by B. A. Swenson, and all those receiving them were called upon to give a brief account of the trip.

A CHINESE ENTHUSIAST.

G. ARTHUR SUN, of Shanghai, China, who has been studying business management at Brown University, in Providence, R. I., for some time past appears in the photograph on the Harley-Davidson machine to which he devotes most of his spare time.

A HOME-BUILT GARAGE.

E. P. CHAMBERLAIN, of Brownfield, Me., submits the accompanying photograph of a neat motorcycle garage which he has been using for some time past. The building, which was put up by Chamberlain himself, is about five by eight feet and has shelves for a 5-gallon gasoline tank, supplies, tools, etc.

LOOSE CONTACT POINTS.

AMONG the rather puzzling causes of hard starting, which is not due to the alternately cool and warm days of this season of the year, is the loosening of the platinum points on the contact lever of the magneto. Those who ride their machines hard all summer may have had their adjustments to make, but it is very probable that the little grinder-out of juice has not needed tinkering until the hard starting has developed. A peculiarity of this hard starting is the fact that on the stand the motor will go off on the first kick of the pedals, but will require a 100-yard sprint at about the rate of 11 seconds to get it to pick up its load. Look at the points inside the contact maker casing, and keep the little nuts tight.

COLD WEATHER TRIPS.

I THINK we all know that certain motors are hard to start in cold weather, even if everything is all right in carburetion, ignition and oiling. But this is the time of the year that I like to ride by night, and I meet lots of others who have the same liking apparently. A little tip for a hard-starting motor, on a cool night trip particularly, is keep the valves lowered at all times when the motor is not running. The heat is kept in as long as is possible, and even if it is a matter of an hour, the motor will start easier. If all the joints are tight, there will probably be some mixture in the cylinder also, which will help some.

ENDURANCE RUN POSTPONED.

AS a result of the death of Leo Martin, a prominent member of the Oakland (Cal.) M. C. and a well-known booster for the sport, the endurance run, which was to be held on October 26-27, was called off.

R. L. BAKER and **F. Hartman**, of Pittsburgh, recently visited Erie, Buffalo, Toronto, Montreal and New York City, on a 3,500-mile motorcycle trip.

THIRTEEN riders out of twenty-four starters finished the recent endurance run of the Zanesville M. C., to Lancaster, Columbus and Newark.

TIPS *And* TOPICS

STEPS have been taken in England to adopt a more stringent system of taxation for motorcycles and cyclecars, and as a result British riders are busy offering suggestions relative to methods of rating which might prove satisfactory. They have a knotty problem to contend with, but it is safe to say that, owing to their characteristic persistence, they will ultimately hit upon a reasonable solution. When they do, we should be glad to take a pointer or two from them. Our own taxation systems—varying considerably in the different States—are usually unsatisfactory. State officials either fail altogether to tax the motorcycle, and then offset this condition with exorbitant fines for the most trivial offenses by motorcyclists, or they impose a random tax on the motor two-wheelers without regard for horsepower, the wear and tear to which motorcycles subject the roads, or any other consideration.

THERE are indications that English riders favor a plan to have their machines taxed on a basis of cubic capacity, if there must be a readjustment, and such a suggestion was recently offered by a representative of the Auto Cycle Union at a hearing on the taxation question. The riders argue that it would be unfair to tax air and water-cooled motors under one head, and that rating by bore or stroke would prove equally unsatisfactory. The matter, after all, simmers down to a scale of the benefits derived by motorcyclists, the expense to which the government is put in regulating them and the part they play in depreciating the roads. If a happy medium can be struck by rating on cubic capacity, the plan will at least be worthy of serious thought on this side, and it may solve a problem for American State officials who are now considerably at sea as regards motorcycles.

THOSE of you who have been reading this magazine for more than two years will remember the talks of the "Veteran," who was a pioneer rider. He was a firm believer in good tools and a sufficient number of them, and his tool-roll was always fat and attracted much attention. Compared to the usual three wrenches, a stumpy screw driver and minute tire kit of the average mount, his outfit seemed like a sample case for a drop-forging salesman. He was a great advocate of the socket wrench in particular, and while rather fussy

on selecting the tool desired for a certain purpose, he could, when necessary, improvise devices to make up for any lack of proper appliances. On more than one occasion he wrote about the use of the proper tool for each job, but there seem to be lots of people who never read the Vet's articles, judging from the way they disable a wrench in short order, for instance.

TAKE the monkey wrench, for example. The general rule for the correct use of this tool is: Keep tight and on the flat, with the jaws in the direction the nut is to be turned. But it is often more convenient for the user to put the wrench on "on end," as in Figure 1; this strains the jaws, and gives the Recording Angel extra work as the wrench slips and scarifies the fingers. The nut is also effected according to its degree of hardness. If you do this with a malleable wrench, monkey or open end, the jaws will break in short order. Figure 2 shows a monkey wrench in proper position for turning a nut in the direction *opposite* to the arrow, but wrong when turning in the direction of the arrow; the wrench then slips off and damages the user and the nut. In Figure 3 another misuse of the wrench is shown, here a piece of pipe is put over the wrench handle to start a rusted nut. The result is seen below.

LOOK at Figure 4; it comes from a motorcycle shop in New York. It was once a nut holding down a cylinder to the crankcase. It does not need much of a Sherlock Holmes to diagnose its troubles. However, for those who are in the habit of using any old wrench on the nut needing tightening or loosening, I will give the key. A and E are marks made by a Stillson wrench; B is where a cold chisel has been used to loosen the nut, and C is the result of using wrenches as in Figure 2. The edges of the nut are "wrenched" off. D is the mark of a cape-chisel or punch, used apparently for tightening the nut at one time. I have the original in my possession; the only thing that has not been done to it is splitting

OHIO motorcyclists, and Good Roads agitators in general throughout the State, have proved themselves in possession of a fighting spirit that is certain to carry them over all kinds of obstacles to ultimate achievement. Not long ago a proposition to bond the State for \$50,000,000 for the improvement of roads was lost at a special election by a small margin, and the boosters have already launched another campaign looking to more favorable action on their plan at the coming session of the legislature. The movement was defeated by only about 1,000 votes at the recent election, and there are indications that through consistent and enthusiastic effort from now on this balance can be placed on the other side of the book.

NORTHERN OHIO has some very good roads, and the central district highways are not to be complained of particularly, but in the southern section, and especially in the southeastern counties, there is an imperative demand for improvements. It is lamentable that a State already in possession of such an excellent foundation for its highway system should balk at the expenditure of funds required to make *all* its roads accessible, and it is the belief of the writer that when the situation is clearly brought home to the voters of the districts involved, there will be satisfactory action. The rural voter, when confronted by a proposition to have his State spend \$50,000,000, is temporarily panic-stricken, and unless he can see that such an investment is going to bring certain and commensurate returns—and that he is going to figure in those returns—he will fight the improvement plans to the last ditch. It is the task of the Good Roads worker to carry forward this campaign of education.

THE attention of the rural voter should be called to the fact that his property holdings advance in value proportionately with their accessibility, and that every improved road is simply a standing invitation to Prosperity. Let him understand that the world is moving too rapidly to turn aside through a guagmire to seek out Farmer Jones; that business in these days follows the channels of least resistance, and that his only chance to attract attention is to visit the nearest town regularly. If the roads are hub-deep with mud and clay he cannot make these trips, his products will not reach the best market

and very few city shekels will find their way into his pocket. The shekel argument is the strongest one with which to approach him. It strikes home. In short, it should be the aim of the Good Roads booster to prove that the future of a country—or a State—depends upon its highways; and there is proof aplenty in every State in the Union that good roads are worth all they cost.

AFTER covering 5,000 miles on his motorcycle over widely varying roads, a Brooklyn (N. Y.) rider estimates his total outlay—including \$5.10 for repairs—at \$23.90, and by way of directing attention to the economical advantages of the motor two-wheeler he states that this mileage could not have been covered by train for less than \$100. So far, so good. The balance of \$76.10 in favor of the motorcycle is certainly worthy of mention, but there is another item of even greater import—the healthful recreation derived from the motorcycle, which could not have been enjoyed in railway travel at any price.

IN these busy days we are too prone to make all our comparisons on a basis of dollars and cents. True enough, the motorcycle's economy is one of its strongest assets, but if its running expenses were doubled, or even tripled, the balance would still be in its favor by a wide margin; a margin of days spent in close communion with nature, days of freedom from the city's wearing grind; days of fresh air, fresh thoughts and fresh aims. It is well enough to keep tab on the elusive dollars as they come and go, but when we subject the motorcycle to a comparison let us not overlook the really big items. After all, there is no return from the motorcycle so valuable as healthful recreation.

F. A. M. members who intend making application to the newly established Touring Bureau for routes or general information should keep in mind the present limited resources of that department and submit their

inquiries as far as possible in advance of the date set for a start on the prospective tour. Every effort is being made to have the touring service as prompt as is compatible with reliability, but it is often difficult to collect and mail satisfactory data for a long trip on a few days' notice. The rider as well as the Bureau will benefit by a more liberal time allowance on touring queries.

LIGHTING SYSTEMS.

WHEN two systems of lighting are resorted to for motorcycle service it is not necessary to fit extra head and tail lamps, as the equipment used for oil or gas may be modified to permit of the installation of electric bulbs, as shown in the accompanying illustration.

tion, submitted by William Hetherington, Jr., a Brooklyn (N. Y.) rider. These small bulbs can be fastened with a clamp which is easily made. If an electric system is used it may be used to operate a horn or whistle in addition to furnishing current for the lighting equipment. It may also supply current for ignition purposes in the case of a battery machine.

MOTORCYCLE POLO.

A NEW sport, motorcycle polo, has been introduced by the Kansas Short Grass Motorcycle Club, and that it requires much skill goes without saying.

HEAVY ENGLISH TAX!

**Proposed By Parliamentary Committee—
Motorcycle Owners May Pay as
Much as \$15 a Year.**

A PARLIAMENTARY committee, recently appointed in England to consider amendments to the present method of determining horsepower of automobiles and motorcycles for taxation purposes, has reported and recommends few changes. The committee considered that the proper basis for rating should be the average power which the engine of a car could develop in regular use on the roads if there were no restrictions in speed other than those imposed by the car itself.

In gasoline and steam cars the present method for determining the horsepower is to divide the piston area in square inches by $2\frac{1}{2}$ for engines of single-acting cylinders with a single piston; by $1\frac{1}{2}$ for single-acting cylinders having two pistons; and by $1\frac{1}{4}$ for double-acting cylinders having a single piston. It was recommended that this formula be left unchanged for gasoline cars.

For electric cars the present regulations prescribe that all motors shall be considered as developing 12 to 15 horsepower, and the committee recommends that this be lowered to $6\frac{1}{2}$ to 12 horsepower. It is also recommended that motorcycles, which now pay a uniform tax of £1 each, be classified as motor cars, and that the following rates be imposed: Not exceeding 5 horsepower, £1 (\$4.87); exceeding 5 but not exceeding $6\frac{1}{2}$ horsepower, £2 2s. (\$10.22); exceeding $6\frac{1}{2}$ but not exceeding 12 horsepower, £3 3s. (\$15.33).

SAVED BABY'S LIFE.

SAITH the New York Sun: "Persons who scorn the motorcycle should read this little story of a heroic performance from the heart of the Ozarks. A baby was dying of diphtheria at Fairplay, a small town fifty miles from Springfield, Mo. The attending physician decided that if he had some antitoxin the life of the baby could be saved, so he telephoned to a Springfield druggist asking him to put a box of the antitoxin on a 'Frisco train that left there at 11 o'clock at night. The druggist received the order only a few minutes before train time and when he got to the station the train had gone. The urgency of the situation had been impressed upon the druggist, so he induced Claude Stroop to attempt the journey on his motorcycle. Stroop started shortly after 11 o'clock. Fifteen miles of his journey was over a sand road, which necessarily impeded his progress. He finally reached Fairplay at 1 o'clock a. m., having consumed less than two hours' time in making the journey. At stretches in his tour he speeded his machine, he says, to a rate as high as fifty miles an hour. The baby was still alive when Stroop arrived and the antitoxin was delivered in time to save its life.

COFFMAN TURNS AUTHOR.

PRESIDENT A. B. COFFMAN, of the Motorcycle Manufacturers' Association, is the author of a highly interesting article on "The Motorcycle, Its Use and Abuse," which appears in the October number of the American Carpenter and Builder. The article is prepared especially with a view of proving the motorcycle's adaptability, and several photographs, showing contractors who make their business trips on motorcycles, add to its value.

"FIRST AID" For the CARBURETER

The "Timely Tipster"

FROM time to time, and often with little warning, an ordinarily well-behaved motor will develop a cranky twist which cannot be traced to faults of ignition, valve mechanism or lubrication, and under such conditions the thoughtful motorcyclist will give early attention to his carbureter. When there is difficulty in starting—or when the motor has apparently decided not to start at all—the jet needle-valve should be examined, as it may not be seating properly, due to some foreign substance on its seat. Try regulating the tension of the spring of the auxiliary air-valve; this may effect a start, but if the lift or motion of the air-valve is seen to be abnormal, look to the jet at once. Blow downward from the mixing chamber to clean away any foreign matter, or use a straw; never employ a wood or metal probe. Examine the seat for damage, and reset the jet opening by means of the needle-valve.

Stoppage, with difficulty in starting, is occasionally due to too high a float level and this may be caused by a bend in the float lever. Try out with the auxiliary air-valve as before and then examine the float lever. The bend is usually due to too vigorous "tickling," and the lever should be removed for reshaping. Adjust the level of the gasoline in the chamber so that it stands about one thirty-second of an inch below the jet opening. A rather sudden stoppage may be due to water in the gasoline this being often found in fuel obtained in the country. Drain out the float chamber and fit a strainer in the fuel line, or carry a piece of chamois skin and pass all gasoline through it when filling the tank.

BRITISH RIDERS ON TRACK AND ROAD

The picture at the left shows three English speedsters in a cup race on Brooklands track; top, at right—Contestants in an English hill climb; bottom—Climbing Cheddar Hill Gorge; some of the most interesting events in which Britishers have competed of late.

SEVEN SPILLS AND DIVERSE OTHER TRIBULATIONS

JAMES F. WELSH, of 1221 North Third street, Harrisburg, Pa., believes he is entitled to any trophy that has been set aside for the champion spiller, and in the article printed below he sets forth his claims. On his first day of riding Welsh struck a sandy stretch after dark which brought him to earth seven times in three miles. He also had a few other thrills which are referred to in the following paragraphs.

I received my machine on a Friday and was naturally very anxious to try it out. Accordingly I decided to make a trip on Sunday and invited a friend, an experienced rider, to go along with me. It seemed years before Sunday arrived, but it came at last, and by 4 a. m. we were on our way, with my friend, Harry Hunt, in the lead. The first five miles were over sandy roads and I had some difficulty in keeping my seat. We had our lights burning, as it was still quite dark. At last we struck roads where the going was good, and I gained confidence in myself and at the same time became careless. Right there I had some of the conceit taken out of me, for I hit

a stone and went down. The old saying is that "a rolling stone gathers no moss," but they are great on gathering green motorcyclists who think they can ride with one hand, and I can prove it. After straightening my crank and absorbing a few hot remarks from Harry, I started again. A short time later we went several miles out of our way, and it was some time before we found the right road again. We then had "good roads" for the rest of the trip; that is, the farmers told us they were good, and every rider knows what a farmer's idea of a good road is. However, we made the most of them and reached our destination at 9 o'clock. So far we had covered 75 miles.

After getting breakfast (for we had started without any), we enjoyed a good drink from the old well, and went to see the ladies. That was really the secret of our trip, as I wanted to show my machine to the girl I was interested in. About 3 p. m. Harry was ready to start for home so as to get there before dark, but by this time I considered myself "some rider" and thought it would be all right to ride part of the way in the dark. However, Harry was persistent, and we finally started, several hours later than we should have.

Everything went well for the first 30 miles; then I discovered that I was all out of oil. Being a novice, I had burned up three quarts of oil in 120 miles. Here for once luck was with me, as I found a saw mill where the power was furnished by a gasoline engine, and I persuaded the owner to give me his last quart of oil.

Harry was rather cross by this time and hit up a fast pace, but as my machine was the faster of the two I was able to keep up with him. After traveling several miles we reached Duncannon, where we stopped to light our lamps. We had no sooner stopped than a fair-sized crowd gathered and started to ask questions. Finally we broke away and started through what is known as Cove Narrows, and it was here that my trouble bug got busy again. I was going along in great shape when we struck heavy sand and the machine tried to get along without me, and succeeded for a few feet. I got up, recovered my Harley, and, thinking we understood each other better, started off again. Then came fall number two; then spills three, four, five and six. By that time I was all in; both cranks were bent and my lights were out, so I decided to camp all night in the mountains and proceeded to

go asleep alongside my machine. To my surprise Harry did not approve of my actions, and some of the pretty things he called me would have put life into an army mule, but they did not affect me; I was intent upon going to sleep. At last he threatened to knock my head off with a wrench and do a few other things, equally disfiguring, and I agreed to get back into the saddle. I was soon on the firing line again with the end of the Narrows in sight, but I was not to get off without another spill. This time I selected a bed of rocks as a landing place. Seven falls in three hours ought to be a record! Just out of the Narrows we struck a small town, where a lemon phosphate helped to revive my spirits. We reached home at last, and I now look back and say: "Yes, I made it without mishap," just as some of the other boys do. So ended my first day's outing, but it was not my last, for I find motorcycling one of the finest of outdoor sports, and have covered several thousand miles since the outing referred to in this article.

FROM MAINE TO THE COAST.

NELSON L. MOULTON, of Kitterly, Me., who left his home late in the summer for a motorcycle trip to San Francisco, was last heard from in Phoenix, Ariz. He spends considerable time sight-seeing and has encountered everything from deep sand to a six-inch snowstorm. At one time he had to walk for miles and allow the machine to pull itself. When he left Maine he was accompanied by a rider from San Francisco, who sold his machine on reaching Kansas City. From Phoenix Moulton will go to the Golden Gate City, via Yuma, San Diego and Los Angeles.

THE DALLAS SQUAD.

AMONG the riders now competing on the new Dallas (Tex.) bowl are: Edward Bowen, Harry Swartz, Wilmer Richards and Jim Cox, all from Denver; Mike Caffarello, of Cleveland; Bert Bruggerman, of Los Angeles; Jim Traffsky, St. Louis, and Edward Harmer, the speedy Chicago saucerite.

Two Views of Novel Machine Designed by Edward McDougall, a Dealer of Newark, N. J.

NEWARK INVENTOR'S NOVEL MACHINE

Cross-Seated Mount with Distinctive Frame Construction Affords Maximum Comfort and Is Capable of a Lively Pace.

By ROY S. PASCALL

W. EDWARD McDUGALL, of the firm of Bush & McDougall, of Newark, N. J., is the inventor of the unique machine which appears in the accompanying photographs. Aiming to provide a more comfortable two-passenger outfit than is available with the standard tandem seat, McDougall entered upon a radical frame departure and

decided to place the seat crosswise, so that plenty of room might be afforded. To permit of such construction entirely new lines were necessary at several points, but the inventor proceeded with an almost total disregard of present-day practice and ultimately realized all his expectations.

In some respects the new McDougall machine suggests automobile construction. The motor is placed forward in the frame and is mounted transversely. It drives through a shaft and bevel gears to a countershaft, and then by chain to the rear sprocket. A multiple disc clutch, working on the countershaft, is controlled by the foot—as is also the brake. A two-speed gear which is still on the inventor's drawing-board will be installed in the rear wheel during the coming winter.

The inventor calls attention to the special construction of the frame, which is unusually strong and rigid, owing to a carefully worked out system of bracing. The seat is upholstered and is wide enough for two people sitting side by side. It is supported on two semi-elliptical springs, thirty inches long, which absorb practically all road shocks. All the controls, both grip and foot, are located on the left side, the handlebars being built with a cross-brace for convenience in driving. The machine holds the road with the tenacity of a leech and is not subject to the violent skids often experienced by the riders of other two-wheelers.

On a recent hundred-mile try-out with the writer as a passenger the McDougall machine attained a speed of over fifty miles an hour, and the absence of fatigue and soreness was appreciated at the finish. The machine has been in almost constant use during the past summer over all kinds of roads.

This Mount Has Carried Its Pilot and a Passenger at 50 Miles an Hour During the Past Summer.

INTERNATIONAL TOUR

BY DONALD MCKIE

PART VII

DONALD McKIE brings the Atlanta tourists to the end of their European jaunt in the following instalment of his article on the international trip, and the riders are now back in this country. This section of his story deals principally with English road customs and the most advantageous methods to be pursued in obtaining driving licenses and registering machines. He also gives a few tips of general value for the American motorcyclist who contemplates a trip abroad with his machine. In future issues Mr. McKie will present special articles on detailed expenses for a 5,000-mile motorcycle tour in Europe, on tire troubles abroad and kindred topics. His last instalment of the tour story follows.

On the Continent one is allowed only 66 pounds of baggage, but this may consist of articles of any kind. My Indian, weighing 264 pounds with the tandem attachment, was taken on this basis and overweight was charged. The cost of shipping from Paris to London was only \$4.40 and it would have been still less, but for the extremely high rate always charged for shipping across the English Channel. The railroads are far inferior to the average road in the United States. They have three classes, and as the proportion of third class passengers seems to be almost 99 per cent., we always took that class, when through necessity we were forced to use the railroads. It takes only one ride on a European train to make one fully appreciate his motorcycle.

On the boat trip across the Channel we met two other American motorcyclists, S. J. Templeton and Leonard D. Karcher, of Chicago, both having 4 h., T. T. Indians, with two-speed gears. They reported practically no trouble, except with tires, and had resorted to a type of Dunlop automobile casing, 28 x 2½ inches. In fitting this tire it was necessary to have a hole drilled in the rim, opposite the valve, where the regular automobile tire lug was used. The cover was very heavy and had given good service. These riders had been touring in Norway, Germany, France, England, Scotland, Wales and Ireland, and a description of their experiences, particularly in Norway, made us wish to tour that country, despite the experiences we had already had. The roads, they said varied from very good to very bad, the latter being the more plentiful. So severe were some of the

hills they encountered that even on low gear and with throttle wide open, their machines could make only ten miles per hour, which they considered good. The reader cannot imagine how delightful it is to meet motorcyclists from home, and exchange views and talk about the various experiences encountered.

How the A. C. U. Helps.

For the rider who cares about the appearance of his machine, it is very distressing to see it hoisted up on the boat for the Channel trip and then unloaded in the same manner, but if one personally superintends the job, no

damage will be done. However, this necessitates tipping practically the entire crew of the boat and anybody else who happens to be hanging around. As explained before, we had joined the Auto Cycle Union, of England, previous to leaving the United States. This is really the motorcycle branch of the Royal Automobile Club, and it is of great assistance to the tourist. On our arrival in England, although it was very early in the morning, a uniformed representative of the association was on hand to assist in the prompt and careful handling of our machines. For the Chicago boys, who were more fortunate than ourselves in having good tires, the official set about to procure gasoline and get them started on the right road. This is not all the A. C. U. does; it maintains uniformed guides on the roads all over England, their sole duty being to aid members of the association and make touring as simple and pleasant in England as possible.

Once in London there are four different kinds of tires that can be fitted on Indian rims. The prices run about the same as in the United States, but the quality of the average make is not up to our standard. About the best that England offers are the Kempshall and Palmer cord tires. Gasoline must be drained from the tanks when shipping. This comes in sealed cans and the standard price, in England, is 36 cents per gallon, but the English gallon is somewhat larger than ours. The two most popular brands of gasoline are sold by Shells and Prats; they are about equal in quality, which, by the way, is very good.

Rules for Registering.

The procuring of a license for driving, and the registering of motors can be attended to at the government offices, in Spring Gardens, London, S. W. The registering is merely the designating of the numbers to be used, and a fee of \$1.20 is charged, while the garage charges \$2.50 for the number. A special size is required by law. A fee of \$1.20 is charged for a driving license. Private owners are

exempt from any technical examination, but licensed drivers have to appear at Scotland Yard for a rigid test. There is also a government tax on the machines, which is levied according to the value. This may be avoided if the rider is willing to take a chance, as there is a certain time of the year, October 1, I believe, when this tax is payable, and if not paid the visitor may wait until the next October. AM of

our party waited, and as we are now back home we are still waiting.

The roads throughout England are fine and I doubt if the British riders ever saw a really bad road. The main roads are all fairly wide, but unfortunately they have many bad curves and the riders are always racing over the roads like city firemen. A surprisingly large number of machines are met on the road and a goodly portion of them have side-cars attached. The single cylinder machines

Scenes
Along
the Route
of the
Atlanta
Tourists
in Italy.

in England seem very practical for side-car work, and it is marvelous how they pull steep hills. In all England the rule of the road is "keep to the left." We had been alternating from left to right in driving for so long that it did not seem at all awkward to us. Where the branch roads join the main ones, there are always hedges growing which make the by-roads invisible, and it is strange that there are not more accidents. Our advice to all who ride in England is to be very careful on the roads, and particularly at turns.

Some Novel Regulations.

In case of an accident or an arrest for speeding, the rider's name is taken and notification to appear before a certain court is mailed to the address given on his driving license, and an entry made in the back of the license, for which purpose there are several blank pages left. According to law the officer is not allowed to take the offender to jail. In case of an arrest of one of our party, for instance, which fortunately never occurred, we would have been notified at the American Express Company, in London. By the time we got back to London and received the notice, we would have been ready to leave England, and would hardly have gone back to appear in court.

Nearly all the roads are plainly marked with sign posts, giving the distance to several towns, and it is difficult to get lost. Before returning to London our route extended northward, just above the boundary line, into Scotland. We had contemplated a ride into northern Scotland, but I sold my Indian to Messrs. Godfrey & Applebee, the London agents for the Indian, and this virtually ended our trip abroad. In all we covered something like 6,000 miles.

Money-Saving Tips.

In summing up there is much that can be said in favor of and against a trip abroad. Such a tour can be made economical or costly, but the needless expenditure of money never gave anybody real pleasure or allowed them to see any more than the prudent person. A good

plan to adopt on the road is to begin inquiring for a hotel before dark, and if you think the price too high, go on to the next place.

Unlike roads in the United States, Continental routes are always dotted with good hotels. It is also well to have the price of every article written down, as this eliminates the possibility of an argument; this applies especially to the purchasing of gasoline, as after the tank is filled the dealer has no scruples about altering the price. Our entire trip was very enjoyable, despite twelve days of continuous riding in the rain.

LONG COLORADO TOUR

Grand Junction Rider Covers 1,687 Miles in Fifteen Days of Actual Riding, Mostly in Rain.

GRAND JUNCTION is a small town in western Colorado; so small, in fact, that comparatively few people have ever heard of it, but it is large enough to harbor at least one motorcyclist enthusiastic enough to do things in true western style. He is H. J. Zieman, who has just finished an eighteen day tour of the State; and this is the second time he has been around this season.

Starting from Grand Junction on his 7 h. Yale twin, Zieman headed for northwestern Colorado, crossed the State line into Wyoming, and then plugged through the rain and mud, along the snowy ridges and over the great Goar range. Once past its summit Zieman found the roads better and had easy riding until he came to the Continental Divide, some four miles of uphill going with an average grade of 16 per cent. Luckily the threatening rain held off until the downgrade was reached—but then it started in for keeps. The sandy roads absorbed a good part of the

downpour, however, and Zieman's motor kept popping away, so that he stuck to the road. Five days of mud, mountains and rain made him welcome a chance to rest up on the sixth day.

Warm and dry again he made his way to Denver, where he spent several days in testing, and then started in on the northern and eastern part of the State. Then the wet weather returned and Zieman decided to change his plans and make for Colorado Springs. After a short visit there he was off for Grand Junction. Again the rain came in torrents, but he managed to make the trip home in three days. Just eighteen days had elapsed from start to finish, and Zieman had covered 1,687 miles, in practically fifteen days of actual riding. Making a record of better than a hundred miles a day is quite a noteworthy achievement, when the rocky country traveled and the almost continuous rain are taken into consideration. The trip was made with an average of 83 miles per gallon of gasoline, nineteen gallons being used.

FINDLAY'S NEW ORDINANCE.

AFTER January 1, 1913, all motorcycles in Findlay, Ohio, will be required to carry a number, for which a fee of \$1 will be charged, according to a recently passed ordinance. This measure also provides a speed limit of eight miles per hour and prohibits open mufflers and riding at night without good lights.

MEMBERS of the East Lynn Motorcycle Club of Lynn, Mass., recently participated in a run to Hampton Beach. This was one of the club's feature runs of the season.

AMONG THE CLUBS

WITH BALTIMORE CLUBS

Riders in Maryland City Are Making the Most of Fine Touring Weather—Chicken Dinner at Ridgeville.

BALTIMORE, Md.—Members of the Maryland M. C. went up to Ridgeville on Sunday, October 27, to enjoy a chicken dinner. The boys are extremely fond of fowl and they always welcome a run to the Maryland city where such a repast can be had. The roads were in excellent condition following the rains of the previous week.

On Sunday, October 20, the club invaded Pennsylvania, a run being made to Hanover. This will probably be the last century run for this season, as Captain Standiford will hereafter take the boys out on the roads near the city. On the way up to the Keystone city the boys stopped off and gathered some chestnuts, the groves being spotted on a scouting trip by W. S. Fisher, the veteran motorcyclist.

Last Friday, October 25, a number of the boys went up to Frederick to witness the motorcycle races in connection with the fair. They took to the road in preference to loading their machines on a train, but before they reached their destination they became mud-larks. Two of the boys carried women tandem passengers, but they got through after having a couple of spills.

Thomas Dedge, the champion of Washington, and Freddie Tiemeyer, the Maryland champion, were scheduled for a speed duel to determine the best rider of the two, and they were disappointed when they reached Frederick and discovered that the track was in such bad shape that it was impossible to run any kind of races. They went up on the train, so as to conserve their energy. Howard A. French had promoted the races at the request of the fair officials.

IT is estimated that one person out of every 350 in Indianapolis rides a motorcycle.

IN the accompanying photograph appear L. S. Taylor, William Bewley and J. F. Sanford, the Merkel team in the recent Ohio State endurance run.

MOURN CLUB PRESIDENT.

THE accompanying photograph shows H. B. Martin, late president of the New Orleans M. C., who sustained fatal injuries in a fall from a scaffold recently while at work as a painter. Mr. Smith was born in Edgar county, Illinois, and also lived for some time in Joplin, Mo. He took up his residence in New Orleans in 1906 and started a sign-painting business in which he was quite successful. He became an ardent motorcyclist and an indefatigable worker for the advancement of the New Orleans club, being finally elected as its president. He is succeeded in the presidency by William P. Copping.

A TROY OUTFIT.

IN the accompanying photograph appear Mr. and Mrs. C. B. Henry, of Troy, N. Y., and their son. The picture was taken after a recent trip to New York City, in which both machine and sidecar stood up excellently. Henry drives an Indian with Majestic passenger attachment. He has fitted his sidecar with a spacious luggage carrier in the rear and has made various other valuable additions to his outfit. He is employed at the Cluett & Peabody collar and shirt factory in Troy. The photograph is forwarded by Edgar Brunelle, dealer in motorcycles and other sporting goods in Troy.

FIFTEEN members of the Sandy Hill Motorcycle Club, of Paterson, N. J., recently participated in a Sunday run to Glen Gardner, over a 150-mile course.

UTICANS WERE ENTERTAINED

Motorcyclists of Cortland Gave Visitors Cordial Reception and Played Hosts at Big Dinner.

ABOUT forty members of the Utica (N. Y.) Motorcycle Club participated in a run to Cortland on Sunday, October 20. The Oneida County courthouse was the starting point and the squad got under way at 7 a. m. With ideal weather and over almost perfect roads they proceeded without incident to Tully. Here a truly hospitable spirit was shown by the members of the Cortland Motorcycle Club, who, although they had learned of the intended visit only the day before, had a delegation on hand to greet the riders and escort them to Cortland. Secretary Ames, of the Cortland Club, had made arrangements at the hotel to accommodate the visitors. After partaking of a fine dinner the Uticans prepared to settle but were informed by the management that the bill had been paid by the Cortland Club.

Next they were taken to the clubs' headquarters, where a pleasant half hour was spent. The clubrooms are located in the center of the city. However, they do suit the club members and they expect to move to larger quarters soon. The kindness of the Cortland boys did not end here; they escorted the riders out by a better route than the one followed in going in. No difficulties were experienced on the homeward trip and Utica was reached by 7 p. m., the schedule time. This was one of the most pleasant runs the club has undertaken, and the cordial reception given them at Cortland scored a distinct hit.

C. B. Henry, of Troy, N. Y., with Wife and Son on Recent Sidecar Trip.

THAT JOINT OUTING.

IN the accompanying photograph the Harley-Davidson riders of Philadelphia, Pa., are lined up as they appeared prior to a recent run to Egg Harbor, N. J., where Alexander Klein, Harley-Davidson agent in Philadelphia, and William Heckenhorn, Harley-Davidson agent in Camden, N. J., were the hosts at a joint banquet. The picture was taken in front of Klein's headquarters when 86 riders were in line. At Camden the squad was joined by 24 riders, so that the party numbered 111 when it finally pulled into Egg Harbor City.

ST. LOUIS RIDERS BUSY.

AT the last meeting of the South Side Motorcycle Club, of St. Louis, Mo., it was decided that the run held on Sunday, October 20, should be the last of the season. These weekly runs have been a feature of the club's summer programme, as a sum of money is set aside each year to be paid in prizes to the three riders attending the most runs. It is the intention of the club to establish bowling teams for a winter tournament, and as there are not enough bowlers in the club, the officials will communicate with the other motorcycle clubs of St. Louis and East St. Louis, and arrange to have a team from each club compete.

OAKLAND CLUB ON RUN

A 110-MILE run was recently held by the members of the Oakland (Cal.) M. C. The course lay through San Francisco and then around the bay to San Jose. After leaving Oakland on the 8:30 a. m. ferry the riders headed up Market street at a slow pace and with minimum noise, thus creating an excellent impression. At San Jose they had dinner and visited the shop of Messrs. Schaackey & Viera, agents for the De Luxe, before returning to Oakland.

NEW GULFPORT CLUB.

IN the last issue announcement was made of the organization of a club in Mobile, Ala., with Edward Kocher as president; M. M. Wilinson, vice-president, and V. W. Root, secretary-treasurer. There is just one important detail awry in this statement; the club was formed in Gulfport, Miss., not in Mobile.

AT a recent meeting of the Columbus (Ga.) Motorcycle Club the following officers were elected: W. E. Page, president; J. C. Ingram, vice-president; G. P. Wright, secretary.

ROAD TRIP AND CLIMB.

TWENTY-FOUR members of the Indianapolis (Ind.) Motorcycle Club participated in a recent run to Spencer, a distance of 120 miles, and all but one finished. On the return trip all the riders had to climb the hill under the Monon railway at Gosport, with a right-angle turn in the middle. John Merz, on a Merkel won first place in the climb.

SALT LAKE PARADE

NO less than 100 machines, with banners and pennants flying, were entered in the recent parade of the Salt Lake City Motorcycle Club. The banners with the words "Safe and Sane Riding" were used to let the public know that the riders are banded together for the purpose of suppressing the speed fiend.

A SAN JOSE OUTING.

UNDER the leadership of J. C. Harris, 30 members of the San Jose M. C., recently made a 120-mile run to Half Moon Bay. The mountain roads were in good condition and when improvements now under way are completed, they will be among the finest in the state.

A WASHINGTON CUP WINNER.

W. F. THROOP, one of the winners in the recent endurance run of the National Capital M. C., of Washington, D. C., appears in the photograph with the Excelsior machine on which he scored perfectly. The run was over a 300-mile course.

F. A. M. COMMISSIONERS.

PRESIDENT PATTERSON has made further reappointments of F. A. M. commissioners as follows: R. B. Barnard, Box 105, Anaconda, Montana; B. A. Swenson, 522 Broad street, Providence, R. I.; William Wood, 712 North Monroe street, Baltimore, Md. E. F. Horine, of 1036 Bardstown road, Louisville, Ky., is a new appointee. Local commissioner appointments are as follows: A. E. Cobb, South Windham, Me.; L. E. Stair, Mitchell, So. D.; A. B. Ramsey, Sammamish, Wash.; C. J. Ritchie, Hoquiam, Wash.; M. E. Code, Toppenish, Wash.; James M. Anderson, Ocota, Wash.; Leon K. Pattison, Everett, Wash.

STUDENTS TO AFFILIATE.

COLUMBUS, Ohio.—Allando A. Case, president of the Ohio State University M. C., of Columbus, is reviving interest in that organization, which was founded last spring. Since the University has reopened many of the club members have returned and the rolls now contain about two score names. Others are joining daily. Quarters have been opened in the Ohio Club on the campus and an application has been made for membership in the F. A. M.

THREE NEW CLUBS.

NEW clubs affiliating with the F. A. M. during the week ending October 19 are reported by Secretary Gibson as follows: Indianapolis M. C., Indianapolis, Ind., secretary, R. H. Sturm, 325 No. Delaware avenue; Star M. C., San Luis, Obispo, Cal., secretary, C. E. Childers, 1044 Monterey street; Yale M. C., Chicago, Ill., secretary, C. J. Main, 722 W. Jackson boulevard.

REGISTERED REPAIR SHOPS

F. A. M. repair shops were registered for the week of October 14 as follows: Jenkins Cyclery (Henry Jenkins) 122 Fourth street, Santa Rosa, Cal.; G. C. Sandruck, 913 North Howard street, Baltimore, Md.

JACKSONVILLE BANQUET

A LARGE attendance and a good dinner marked the annual banquet of the Jacksonville (Fla.) Motorcycle Club, which was recently held at the Seminole Hotel. The club now boasts a membership of 150.

PROVIDENCE SMOKER.

ON Saturday evening, October 12, the Providence (R. I.) Motorcycle Club held one of its bi-monthly smokers. The attendance was large and the members found many incidents of the recent Triangle Run to talk over.

MANUFACTURERS

BROWN SCIENTIFIC TUBE

A Non-Deflating Tube of Novel Construction That Retains Its Air After Any Ordinary Puncture.

ONE of the principal drawbacks to complete enjoyment of motorcycle riding is that bugaboo to which every rider is subject—tire trouble.

It should, therefore, be of unusual interest to riders to learn that the Voorhees Rubber Manufacturing Company, of Jersey City, N. J., has placed on the market a non-deflating, air-filled motorcycle tube, which it claims will eliminate, to a large extent at least, flat tires, blow-outs and kindred troubles.

Several strong claims are made for the Brown Scientific Tube, principal among which are: First, that it withstands a tread puncture without deflating the tube; second, the higher the pressure, the tighter the puncture closes; third, because of the heavy tread and strong fabric insertion it reduces tread blow-outs; fourth, the risk of destroying casings by reason of punctured tubes is eliminated.

The principle, discovered and patented by the inventor, John Hamilton Brown, provides for the thickening of the tread portion of the tube, and when the tube is vulcanized it is turned inside out so that a compression of the rubber is obtained, sufficient to securely close a puncture; this compression is aided by an insertion of extremely high grade non-elastic fabric. The materials used are selected with special reference to the construction of this valuable invention, and represent the many years' experience in the business, as well as exhaustive practical tests with the sole purpose of making, without regard to cost, the most efficient pneumatic tube ever produced.

None of the so-called "dope," gum, paste, or other foreign matter is used in the Brown tube. It is just an ordinary air-filled tube, but by reason of a scientific though simple principle of construction, briefly described above, a puncture will automatically close, even when the aperture is as large as is made by a ten penny nail or knife blade.

THE NEW M-B.

CONSIDERABLE attention is being attracted to the new M-B machine, the product of the Morse-Beauregard Company, of Detroit, Mich., which recently appeared on the streets of Detroit, and the manufacturers look forward to ready sales when the 1913 season is under way. The company is headed by William Morse; William Beauregard is general manager, and Frank E. Whipple is secretary. The capital stock is being increased from \$10,000 to \$100,000.

F. C. MOHRFELD, of Trenton, N. J., has opened headquarters at 238 North Broad street, for the exclusive sale of Flanders machines.

SIMPLEX OIL GAUGE.

REPORTS from the Buck Sales Co., of 211 North Twelfth street, St. Louis, Mo., are to the effect that orders for its sight-glass oil gauge, recently placed on the market, are exceeding all expectations. The gauge, which is easily fitted in the crankcase of a motorcycle motor, shows the level of the lubricant at all times and thus enables the rider to operate at the greatest economy and efficiency. The device, which is sold under the trade name "Simplex," retails at \$1.50.

CROCKER AT DENVER

A. H. CROCKER, cashier of the Pacific coast branch of The Hendee Manufacturing Company, has been elevated to the management of the Denver branch. Mr. Crocker succeeds W. E. Johnston, who has been transferred to Atlanta, Ga., to assume charge of the new Indian branch just established in that thriving Southern city.

Crocker won his spurs as an Indian traveler in Kansas and Nebraska before going to California, and also has earned honors as an endurance rider. Upon taking charge at Denver he will relieve E. M. Jackson, who then will make his headquarters at the factory. Mr. Jackson succeeded Mr. Johnston pending the appointment of a permanent manager at Denver.

A NOVEL SPARK PLUG.

A NOVEL idea is embraced in the Flash Ball spark plug, manufactured by the Toledo Auto Devices Company, of Toledo, Ohio. The central electrode terminates in a ball which, it is claimed, acts as an accumulator of current besides providing for sparks of unusual intensity between itself and the four contact points of the shell. It is also stated that the ball deflects the sparks into the mixture, thus working for greater efficiency. The plug is now being manufactured for automobiles, but it is the intention of the makers to produce it for motorcycle service. The plug has given excellent results in tests.

BOWL FOR FORT WORTH?

IT is reported that Jack Prince is to build a new board track in Fort Worth, Texas, and that the project is being handled by R. A. Healy. Fort Worth is only 32 miles from Dallas.

A PROMISING OUTLOOK

U. S. Rubber Company Will Have Vast Yield from Millions of Trees in Sumatra Rubber Plantation.

RECENT reports are to the effect that the United States Rubber Company now has 80,000 acres of land in Sumatra planted in rubber trees, some 2,500,000 trees being set out, and already the prospects of the investment are held to be extremely promising. It is predicted that in time the company will be rendered independent of the open market, except for the finest Para. The oldest of the trees planted are now between two and three years old and as best results are obtained only by tapping trees not less than five years old, it will be two or three years before rubber from that source is expected.

It has been figured by some that when the trees begin to yield fully, there will be a saving equal to 4 per cent. on the common stock, basing this figure on an estimated output of 5,000,000 pounds from the plantations. Even the production of 1,000,000 pounds would mean an addition of a full 1 per cent. on the \$25,000,000 United States rubber common, taking the value of crude rubber at \$1 a pound, and estimating that it will cost the company 50 cents a pound to produce it in the plantation.

THE EGYPTIAN MIXER.

SATISFACTORY reports are being submitted with reference to the service given by the Egyptian Mixer, a patented device for completing the vaporization of fuel after it leaves the carbureter. The mixer is manufactured by the R. D. Loose Mixing Chamber Company, of 110 North Fifth street, Springfield, Ill. The device is inserted in the intake pipe between the vaporizer and the cylinders, where any particles of gasoline not previously aerated are broken up and converted into useful vapor.

BRANCH IN BOSTON.

A DIRECT factory branch of the Pennsylvania Rubber Company, of Jeannette, Pa., has been opened at 149 Berkeley street, Boston, Mass. The branch will carry a complete line of the company's tires and rubber products. C. W. Lawrie has been appointed as manager.

ON PUBLICITY STAFF.

JOHN J. O'CONNOR, formerly with the *Bicycling World*, has joined the forces of the Hendee Manufacturing Company and will take care of Indian publicity hereafter. He has been a number of years officiating in motorcycle, bicycle and other track events in New York and vicinity.

LAWRENCE HALL, Flanders agent at Waco, Texas, has also taken the agency for the Excelsior for 1913.

Two new Goodrich structures now nearing completion at Akron, Ohio. Office building on the left; factory extension on the right. The office building, which is to be six stories in height, will be handsomely finished and fitted with every convenience for facilitating the handling of the company's rapidly expanding business.

NEW GOODRICH BUILDINGS.

RECENT additions to the B. F. Goodrich Company's plant in Akron, Ohio, remove any shadow of doubt as to the company's belief in the future of the rubber industry. Although the present floor space is between sixty and seventy acres, it is now being augmented by the new building shown at the right of the accompanying photograph. This structure, of six stories and basement, is 270 feet long by 157 feet wide. It is of modern, fireproof construction throughout.

As the office staff is increasing in proportion to the growth of the factory it has also been found necessary to make an extension for this department, and a six-story office building is in course of construction, while an extra floor is being added to the present offices. The new office structure appears in the photograph at the left.

ON SUMMER SCHEDULE.

IT is announced that all the United States Tire Company's plants will be operated throughout the winter on full summer schedule. This means that they will be run night and day, three shifts of workmen being employed.

NEW BRANCH MANAGERS.

H. A. FARR has been made manager of the Seattle (Wash.) branch of the United States Tire Company, and C. H. Mayer has been promoted to the managership of the branch in Portland, Ore.

A ST. PAUL EXTENSION.

THE Prest-O-Lite Company, Minneapolis, Minn., has bought property 80 by 336 feet in St. Paul, Minn., and will make extensions. The newly acquired land is valued at \$8,000.

FEDERAL COAST BRANCH.

L. L. RETTIG will be in charge of a factory branch of the Federal Rubber & Manufacturing Company, to be opened at an early date in San Francisco, Cal.

W. J. ASH, formerly with the Hine-Watt Company, is now on the staff of the Chicago Cycle Supply Company, as a traveling representative, his territory being the far West.

SLADKIN'S BIG CONTRACT.

A NNOUCEMENT is made by the Haverford Cycle Company, of Philadelphia, that it has contracted with the Excelsior Motor Manufacturing & Supply Company, of Chicago, for 3,000 Excelsior machines to be delivered for the 1913 season. The territory in which the Haverford company will distribute the Excelsior products includes the States of

Max Sladkin, of the Haverford Cycle Co.

Pennsylvania, New Jersey, Maryland, Delaware, Virginia, North Carolina, South Carolina and the District of Columbia.

In ten days the company booked orders for 1,150 machines, and it is confidently expected that the entire lot of 3,000 will have been disposed of before the New York show opens. The company is receiving 170 machines a month and during September all the machines were shipped promptly on orders. These conditions lead the Haverford company to believe that 1913 will break all sales records.

A LONG-DISTANCE SALE.

BALTIMORE, Md.—To sit in your store in Baltimore and sell goods to a man in Minnesota for delivery in Vermont is quite an unusual experience, yet Howard A. French has just done that very thing. Several days ago he received a letter from White Pine, Minn., in which a man said he had found one of French's circulars in which second-class machines were advertised. He enclosed the price of one and ordered that it be shipped to a man in Vergennes, Vt. French had in stock at the time just the kind of machine the man wanted, so he shipped it up to New England.

A NEW YORK COMPANY.

THE Knickerbocker Havers Company, of New York, capitalized at \$50,000, has been incorporated to deal in automobiles, motorcycles and motor vehicles generally. The incorporators are E. M. Cravath, B. M. Crosthwaite and F. E. Grant.

TRADE BREVITIES.

C. E. BARR, distributor for the Indian in Columbus, Ohio, recently left for Springfield, Mass., where he will visit the Hendee plant and make arrangements for his 1913 allotment of machines.

PIQUA, Ohio, now enjoys a larger and better Indian wigwam, thanks to W. O. Lane, local chief. The trail leads to 121 So. Market street, where Indian riders will receive a cordial welcome.

ANDREW KRAUS, Indian agent at Auburn, N. Y., is proud of his new headquarters at 8 Genesee street. It is 90 feet deep and has excellent showroom and shop facilities.

CHARLES BROOKS, of the Twentieth Century Manufacturing Company, has reached Chicago on his western trip and reports lively business all along the line.

JESSE LESH, of Chattanooga, Tenn., who conducts a motorcycle and bicycle shop on West Sixth street, has taken the agency for the Pope.

A TRIP THROUGH THE COVENTRY PLANT

Herbert F. Funke, Representing American Distributors of Well-Known Chain Line, Gives Interesting Data on Return from England.

TOOL SHOP MACHINE SECTION

POWER PRESS DEPARTMENT

AUTOMATIC LATHE SECTION.

AUTOMATIC LATHE SECTION

POWER PRESS SECTION.

to quick and easy transportation to the works proper.

In the stores will also be found testing machines upon which frequent tests of the various qualities of steel are made. This insures a rigid adherence to the Coventry standard of quality. Then the material is labeled with the results of these tests, together with the date and the source of supply.

The visitor then follows the strip steel into the press room, where the material is fed into automatic presses, from which emerge, with incredible rapidity, links of the required size. These links are then beveled and barreled to remove any burrs, after which they are carefully inspected.

While the strip steel is undergoing the transformation into links, the steel bars are passed out to the automatic department, where machines of special construction and marvel-

Herbert F. L. Funke.

ous strength are used in the production of bushes, rivets, rollers, etc. These are cleaned and inspected and then passed out to the assembling department. Here hundreds of dexterous workers perform multitudinous operations on the many small pieces, the results being complete lengths of chains, in constant streams, which undergo another severe inspection and test.

Each chain is tested for a load much in excess of that which it will ever be called upon to bear in actual use. It is then given a grease bath to assure its being properly lubricated before leaving the works. The persistent testing and inspection which each chain undergoes is one of the features of the organization in the shops of The Coventry Chain Company, and the result is that efficiency in operation which is the leading characteristic of "The Coventry" chains.

In spite of the number of automatic machines used, over 1,400 persons are employed. A bonus is offered for extra good work, and it is consistently collected. The comfort of the employees has been of prime importance to the management, and in addition to the restaurant, where hot meals can be obtained, a circulating library has been established and stocked with standard educational works. All in all, the plant is a model of its kind.

COINCIDENT with the unloading of other heavy weights from the steamship *Lusitania* the other day, Herbert F. Funke, of the Sarco Engineering Company, United States distributors of "The Coventry Chains," ambled serenely down the gangplank and stood once more among the sounds, sights and smells of "good old New York." Mr. Funke had been on a combined business and pleasure trip through England, his main purpose being the annual inspection of the Coventry chain plant at Spon End Works, Coventry, England. So interesting is Mr. Funke's description of the various processes employed in the making of "The Coventry" chains that a brief resumé of the method of their manufacture is apropos.

Under the guidance of A. S. Hill, the managing director, the visitor is first given a comprehensive survey of the entire plant, which has a floor space of considerably over 100,000 square feet. Hygienically the buildings are ideal, the construction permitting of but one story, with the consequent increase in headlight.

In the receiving department, which is strategically situated so as to be easy of access to all parts of the works, will be found material of many sizes and sections to meet all the requirements of the various departments. Coils of strip steel for links of all sizes, and bundles of drawn and rolled steel bars are systematically stacked, with a view

THE HENDERSON ABROAD

SEVERAL American tourists who have returned from England during the last fortnight report that British riders and the trade are giving unusual attention to the Henderson machines now being demonstrated in London and vicinity, and that the four-cylinder mounts from Detroit are creating an excellent impression. Henderson machines have been shipped abroad in quite large numbers of late and the company's export trade is steadily growing.

While this field is being developed the company is not overlooking home sales, and an unusually active campaign has been mapped out for the coming season. Considerable new territory has been signed for during the last month, and assurances are being given that 1913 deliveries of the attractive Detroit mount will be made promptly.

A YEAR'S GROWTH.

LATEST reports are to the effect that the Goodyear Tire & Rubber Company has 67 branches, 11 of which are in Canada, 55 in the United States and 1 in Mexico, with a new field being opened in England, Australia, South Africa and European countries. Between September, 1911, and September, 1912, the company found it necessary to open direct factory branches as follows: Albany, N. Y.; Dayton, O.; Kansas City, Mo.; Denver, Col.; Newark, N. J.; Oakland, Cal.; Omaha, Neb.; Portland, Me.; Rochester, N. Y.; St. Paul, Minn.; Spokane, Wash.; Salt Lake City, Utah; Syracuse, N. Y.; Worcester, Mass., and Mexico City, making a total of sixteen new branches in the past twelve months. New Goodyear buildings have been erected the past year at Grand Rapids, Wis.; New York City; Baltimore, Md.; Buffalo, N. Y.; Columbus, O.; Birmingham, Ala.; Kansas City, Mo.; Louisville, Ky.; Minneapolis, Minn.; Memphis, Tenn.; Newark, N. J., and Philadelphia.

A HENDERSON agency has been opened in Washington, Pa., by the Union Motor Car Company.

A View of the Salesroom of the California Motorcycle Co., of Los Angeles, Cal.

READY FOR BIG THINGS

California Motorcycle Company of Los Angeles Has Entered Western Field Auspiciously.

THE California Motorcycle Company, located at 818 South Main street, Los Angeles, Cal., has just completed its incorporation under the laws of Arizona with a capital stock of \$50,000, divided into 5,000 shares of a par value of \$10 each. Of this stock, 3,400 shares are common stock and 1,600 shares preferred stock. Preferred stock will pay a 6 per cent. accumulative dividend before a dividend is set apart or paid on common stock. The company has also incorporated under the laws of California. The California company is an operating company and all business will be conducted by it.

The stock of the California company is held by the Arizona company, which is a holding company, and all the private stockholders are in the Arizona company. In this the stock

Headquarters of the California Cycle Co., in Los Angeles, Cal.

held by individuals is made fully paid and non-assessable, and there is no liability to the stockholders beyond the actual investment. The directors in the company are Thomas French, Jr., L. E. French and E. J. Spaulding. Officers are Thomas French, Jr., president, and L. E. French, secretary and treasurer. The California Motorcycle Company is handling the Eagle and M. M. machines.

The business affairs of the company are managed by L. E. French. Mr. French went out to California from Buffalo, N. Y., a year ago. He was manager of the Buffalo branch of the American Motor Company for two years. He is a graduate in mechanical engineering of Harvard University. He will be aided in his work by E. J. Spaulding, who will act as assistant manager. Mr. Spaulding is a graduate of Carnegie Tech. Besides handling the two motorcycles the California Motorcycle Company will manufacture a few motorcycle accessories. Mr. French has just taken out a patent on a new form of motorcycle lock which is attached direct to the frame of the machine.

1913 CONTRACTS.

COLUMBUS, Ohio.—P. I. Haynes, of 45 North Third street, Columbus, has contracted to handle the Harley-Davidson and Flanders machines in central Ohio for the season of 1913. The first of the new models arrived about the middle of October. Mr. Haynes expected to make a trip to the Harley-Davidson factory at Milwaukee about the first of November.

C. W. Waughop's Henderson Exhibit at Recent St. Louis Race Meet.

A BALANCING TEST.

FLOYD W. BAUM, of Champaign, Ill., who recently returned from a 3,500-mile European tour, appears at the left in the photograph, and at the right are Claude E.

Crout, of Hyde Park, Mass., and George R. Graves, of Boston, Mass. Baum and Crout had just met on the road when Graves happened along and perched himself on Crout's tandem attachment. While discussing roads and motorcycles in general Crout asserted that his Eagle machine was so well balanced that he could ride it at 40 miles an hour with both hands and feet free. Baum questioned his

ability to make good this boast and Crout went him one better by offering to carry him on his tandem seat during the test. The second picture shows the machine in action, both riders having their hands and feet free.

CAPTURED HORSE THIEF.

COLUMBUS, Ohio.—A motorcycle came in handy recently when Jack Windon, of Columbus, arrested a horse thief after giving chase for nine miles. The thief gave the name of Charles Scott, but has been identified as Frank Miller, of Circleville. He was chased by the police department and was at the point of escaping when Windon took up the chase on his motorcycle and succeeded in making the capture.

OAKLAND ENDURANCE RUN.

AN endurance run to Redding, Cal., was held on October 26 to 27, under the auspices of the Oakland Motorcycle Club. Many entries had been received from nearby towns. The distance covered was 530 miles and prizes in the shape of gold and silver medals were awarded to those finishing with perfect and "near-perfect" scores.

HOMER A. GARFORD, of 338 East Bridge street, Elyria, Ohio, reports the theft of his Harley-Davidson, chain-drive twin. The engine number was 5784-B.

IN a recent economy run held at Fairbury, Ill., one of the riders covered 40 miles on one quart of gasoline.

SALT LAKE OFFICERS.

AT the last meeting of the Salt Lake City (Utah) Motorcycle Club the following officers were elected: E. L. Hiteman, president; R. George Darke, vice-president; R. A. Van Alen, secretary; S. M. Solomon, treasurer, and L. S. Galeazzi was chosen captain. The officers, together with the following, compose a board of trustees: Lon Clafin, C. W. Brewer, J. L. Anderson, R. L. Irvine and A. Claspill.

ON EASTERN TRIP.

SALES Manager Robert Hinds, of the Yale staff, recently left Toledo for a ten-day trip through the East. He is accompanied by F. C. Cornish, sales manager for the bicycle department, and together they will visit Syracuse, Rochester, New York, Boston, Philadelphia, Baltimore and other large cities. They will close some big 1913 contracts both in the motorcycle and bicycle lines.

TRANSFERRED H-D INTERESTS.

T. C. DONAHUE, of Pittsburgh, Pa., who has handled the Harley-Davidson machines for the last few years, recently transferred his business to S. C. Hamilton, formerly the Excelsior agent. Mr. Hamilton will continue business at his old stand, 131 Collins avenue, and will carry a full line of sundries and parts.

HARRY LONG'S RIDE.

EDITOR **MOTORCYCLE ILLUSTRATED**—In the issue of October 3, page 21, is an account of Harry Long's great sidecar ride in the British Isles, in connection with which I would like to make the following statements: First, Long replaced only three valves during his 20,000 miles, and not one every 100 miles; second, the final drive on the 4 h. Singer is by 1½-inch V-belt, and the primary drive by chain. Belt drive even for sidecar work is still almost universal in England and is found perfectly satisfactory if the motor pulley is over 4 inches in diameter and the belt large enough. I drove a twin Rex and sidecar through the last London-Edinburgh run and experienced no belt trouble whatsoever, though the belt had done 600 miles previously.

RANDAL E. GOLDEN.

LEO BIRKENBACH, on his Thor, recently covered 64½ miles, in sixty minutes of continuous riding at the Columbus (Ohio) mile track.

**A BUSY SAN JOSE SHOP**

ONE of the busiest shops in San Jose, Cal., is operated by Schaackey & Viera, local agents for the De Luxe. The headquarters is shown in the accompanying photograph with a few members of the Oakland M. C. lined up outside. The firm believes in keep-

FROM PORTLAND.

ALL the way from Portland, Ore., comes the accompanying photograph showing four feminine enthusiasts. It is forwarded by R. A. Gaertner, M. M. agent in Portland, who states that the motorcycle has made rapid gains in popularity of late throughout his territory. Gaertner distributes M. M. and Eagle machines in Washington and Oregon and covers all his field on a 9 h. Eagle twin.

E. D. HENSLEY, 17 South Findlay street, Dayton, Ohio, has been appointed State secretary by the Ohio State commissioner, and the following committee chairmen were appointed: Press, Frank L. Valiant, Middletown; competition, R. W. Kirby, Urbana; legal action, Carl Cappel, Dayton; highway improvement, M. E. Remelin, Cincinnati.

AT a recent meeting of motorcyclists in Freeport, Ill., a club was formed and the following officers were elected: Dell Cole, president; C. L. Bossmeyer, vice-president; J. Boyd Luebbing, secretary-treasurer.

THE Indian Motorcycle Club, of Cincinnati, O., recently held the first of its winter bowling contests. These contests are between the riders of singles and twins. The club's membership is now near the 100 mark.

MOTORCYCLISTS in and near Oroville, Cal., about sixty in number, are planning to form a club and affiliate with the F. A. M.

ing on the jump, and as a result a promising business has been built up and the cause of the motorcycle has been rapidly advanced in San Jose and vicinity. Schaackey stands on the right of the De Luxe machine in the center of the picture, and Viera is at the left. Photo by H. Conboy.

FIVE SCORES INTACT

Nine Riders Started in National Capital Endurance Run, but Four Fell by the Wayside.

BECAUSE of threatening weather only nine starters took to the road in the recent endurance run of the National Capital Motorcycle Club; Earl Isel left 30 minutes late, but reached Westminster, the first checking station, only ten minutes behind time. Charles H. Cross was in charge at Westminster and checked off seven perfect scores; the eighth rider, W. W. Tancre, Excelsior, skidded and damaged his machine so that he was unable to continue. Lancaster was the next control, but before reaching that point, Kendig, P. E. M., and Egan, Excelsior, met with minor accidents and were forced out, leaving only six to be checked in by Alex Klein, who acted as the official at Lancaster. William Moore, Flanders, towed Kendig 14 miles to Lancaster and arrived at the checking station on time. Escorted by members of the Philadelphia Club, the riders reached the Quaker City in good time.

The return trip was started promptly at 7 o'clock the next morning, and by the time the riders reached Havre de Grace, Md., Ellis King, Excelsior, had dropped out. F. M. Mills, of Washington, was in charge of the Havre de Grace control. On leaving this point the riders were confronted by an unexpected difficulty; owing to a typographical error, the cards furnished the riders called for a schedule of nearly 40 miles an hour between Havre de Grace and Baltimore, and Baltimore and Washington. This was made more difficult as a long section of the road had recently been plowed by road-builders. Nevertheless the remaining five riders reached the Baltimore checking-master on time and then arrived at the finishing point in Washington in the following order: J. S. Berryman, Harley-Davidson, first; Earl Isel, Excelsior, second; G. W. Beall, Harley-Davidson, third; William Moore, Flanders, fourth, and W. F. Throop, Excelsior, fifth.

All the machines finishing were in good shape, and the excellent performance of the Flanders single was remarked particularly. This machine was the only single to finish.

THE DeLuxe motorcycle will be represented in Oakland, Cal., by the Oakland Cycle and Motor Company, 1720 San Pablo avenue.

W. H. Pelham, on 3-Valve Indian With Which He Won the Baribeau Cup at Winnipeg, Man.

Scenes on the Pyramid Lake Indian Reservation, Described in Volney E. Davis' Touring Story Published in the October 17 Issue.

DALLAS SAUCER OPENED.

NEARLY 2,000 race followers witnessed the opening program on the new Dallas (Texas) bowl recently, despite the fact that the State fair was running as a counter attraction. The races passed off without a mishap, and the crowd was well pleased with the exhibitions given. The Dallas saucer was completed in two weeks.

EXHIBITION RACES

AN exhibition race meet was recently staged at Petersburg, Va., by the Old Dominion Motorcycle Club, of Richmond. The object of the races was to interest the promoters of the State fair with a view of having motorcycle events staged at the fair next year, and a favorable impression was created.

AMONG the clubs to celebrate Halloween with entertainments was the Englewood M. C., of Chicago, Ill., whose members held a dance.

SEATTLE RACES.

AT the motorcycle races recently held in Madison Park, Seattle, Wash., Archie Taft, Excelsior, captured four firsts and one second out of five starts. His never-failing nerve and wonderful skill in handling his Excelsior made him a favorite with the crowd.

The 30-mile race for a purse of \$100 and the John Considine cup brought out three entrants, Taft, Freddie Mercer and E. P. Zwick. Mercer was forced to leave the track in the ninth mile on account of engine trouble, and Taft was an easy winner.

The opening race, a five-mile event, was the most interesting of the day. Taft, Mercer, D. A. Cline and Zwick were the entrants; Mercer led the field for the first seven laps, after which Taft set the pace. In this event Cline was thrown from his machine, but was uninjured. Taft finished first in the ten-mile event, with White, Indian, a close second. In the fifteen-mile race White crossed the tape with fifteen yards to spare and Taft was second. Taft proved himself to be the fastest eater in the six-mile novelty race, in which each contestant after riding two miles had to stop in front of the grandstand and gobble a good-sized chunk of huckleberry pie.

HANDICAP WAS TOO HEAVY.

BALTIMORE, Md.—The second novelty race at the Laurel meet was staged on Friday, October 18. Tommy Dedge, of Washington, who lost the previous race through a fluke in starting, was doped out to flash under the wire the winner. But the wise ones went to smash in figuring on past performances, and the surprise of the meet was sprung when the two horses came in first and second, with the foot runner a close third. Dedge failed to show at all and the two automobiles were completely out of the running. Dedge had a big handicap to overcome, he having more distance to cover than any of the other entrants, but at that he was figured to be an easy winner with his big 7 h. machine.

AN INDIANAPOLIS TOUR.

INDIANAPOLIS, Ind., October 26.—Captain E. P. Whitmer, of the Indianapolis M. C., led a band of fifteen riders on a two-day pleasure run to Louisville, Ky., today, where they were the guests of the Louisville Club. The Indianapolis riders went at the special request of the Louisville club that met the Hoosiers at Spencer, Ind., and escorted them to Kentucky soil. Since organizing some months ago the Indianapolis M. C. has 100 members.

THE U. S. Tire Company, Washington, D. C., will soon open a branch at 133 H street, N. W.

Wilfred Morrison, 15-year-old Toronto Rider.

LOS ANGELES BOWL OPEN

Big Crowd Sees Stars in Thrilling Exhibitions—Two Sensational Spills But No Serious Injuries.

LOS ANGELES, Cal.—Four thousand enthusiastic fans witnessed the opening of the Los Angeles Motordrome on Sunday afternoon, October 20. The use of unported machines seemed to be quite a success, as all the races were extremely close and the crowd was kept cheering for its favorites throughout each event. In the first race of the day W. G. Hamilton rode a two-mile exhibition and established a track record for single cylinder machines.

The two-mile invitation event was a warm contest between McNeil and Wold, the former winning by a narrow margin. Fleckstein, who took third money, was right up with the leaders all the way and at times looked like the winner. After the race was over McNeil shut off and came down on the running board and was coasting toward the paddock when Wold came up from the rear under power. Not seeing McNeil until he was almost upon him, he turned on the juice again and the first collision of the season occurred. Fortunately neither rider was seriously hurt, their injuries being small cuts and bruises, pretty well scattered.

Lee Humiston came out with a winning streak in the third race, and although given a good rub all the way through by Marty Graves, he managed to cross the tape a few feet ahead of the bunch. In the fourth lap Stokes was hanging onto Ward's rear wheel, and in attempting to make the pass his front wheel came in contact with Ward's rear wheels. Ward stayed on the track, but Stokes was thrown from his machine, sliding on his shoulders for a distance of nearly 100 feet. It was a great relief to the audience when Stokes climbed from under the wrecked machine and walked unassisted to the paddock. Several hundred small slivers and a few cuts and bruises were the extent of Stokes' injuries.

Fleckstein displayed good riding ability in the last lap of the Invitation event and crossed the tape just ahead of McNeil and Wold, who took second and third money in the order named. In the fifth event Humiston again nosed out Ward at the tape, while Montgomery was close behind in third position. Fleckstein was victorious in the sixth event by a small margin over Wold.

In the seventh event Al Ward and Humiston were fighting it out for the lead on the last lap and were riding side by side when Ward suddenly shot Humiston up the track when they were close to the tape, and in so doing gained a slight lead over Humiston which could not be overcome in the short distance remaining.

The Angel City Derby was as close as the previous races and was a nip-and-tuck affair between Humiston and Ward, with neither having very much on the other. In the last half of the last lap Humiston forged ahead and gained a slight lead, which he held to the tape. The consolation event was won by Dave Kinney, with Wells Bennett a close second.

First event, two-mile single stock machine—Won by W. C. Hamilton on P. E. M. Time, 1:52½. Record for stock single cylinder.

Two-mile professional invitation—Won by J. A. McNeil, Salt Lake (Indian); L. Fleckstein, Denver (Indian), second; Frank Wold,

Los Angeles (Indian), third. Time, 1:39.

Two-mile professional (open)—Won by L. I. Humiston, Salt Lake (Excelsior); M. J. Graves, Los Angeles (Indian), second; Al Ward, Los Angeles (Indian), third. Time, 1:37.

Professional invitation—Won by L. Fleckstein (Indian); J. H. McNeil (Indian), second; Frank Wold (Indian), third. Time, 2:29½.

Three-mile open—Won by L. I. Humiston (Excelsior); Al Ward (Indian), second; F. Montgomery (Indian), third. Time, 2:20½.

Four-mile invitation—Won by L. Fleckstein (Indian); Frank Wold (Indian), second; F. Verrill (Indian), third. Time, 3:26.

Four-mile professional (open)—Won by Al Ward (Indian); L. I. Humiston (Excelsior); F. Montgomery (Indian). Time, 3:21½.

Six-mile Angel City Motorcycle Club Derby—Won by L. I. Humiston (Excelsior); Al Ward (Indian), second; F. Montgomery (Indian), third. Time, 5:05½.

Two-mile consolation—Won by Dave Kinney; Wells Bennett, second; R. C. Regnon, third. Time, 1:40.

REPORT ON 24-HOUR RUN.

REFEREE R. H. CRISTY'S report on the recent 24-hour endurance run of the Worcester (Mass.) M. C. shows that the only perfect score went to Glen G. Crandall, a Thor rider. Watson J. Walker, Harley-Davidson, was in second place, with twenty points deducted from his score. He was four minutes late at Albany and in checking out of Springfield on the return trip he started ten minutes before his scheduled time. This leaves Walker with a score of 980. W. F. Mann, Thor, was third with a score of 956; he was seven minutes late at Albany and nineteen minutes behind time in checking in at the finish. Gustaf Johnson, Indian, had a score of 878 points, he having been ten minutes late at Albany and fifty-five minutes late at the finish. An allowance of two minutes was made at each control for variation in watches.

DURING 1911 no less than 3,712 motorcycles were registered in Massachusetts, and up to October 1 last the registration was 4,720.

A MOTORCYCLE jaunt of 1,000 miles, from their home in Aberdeen, S. D., to Minneapolis, Minn., was recently made by A. J. Eddy, F. J. Parsch, and G. E. Petrick.

F. A. Applebee, on Scott Machine, Winner of 1912 Senior T. T. Race.

F. A. M. STATE COMMISSIONERS.

THE latest State commissioner appointments by President Patterson are as follows: Shelton Sturges, 108 Court street, New Haven, Conn.; W. H. Whiting, 1328 Broadway, Denver, Col.; O. F. McLain, 18 West Market street, Indianapolis, Ind. Walter S. Chase, Milo Junction, and Francis O. Hill, of Monticello, are local appointees for Maine. Those for Colorado are: F. J. Herman, 122 South Union avenue, Pueblo; F. J. Miller, care of D. C. Muth Motor Company, Greeley; O. W. Hall, Fort Collins, and Henry E. Abbott, of Trinidad.

F. A. M. BULLETINS.

F. A. M. repair shops registered during the week ending October 26 were as follows: C. B. Hopping, 321 South Second street, Albuquerque, N. M.; O. E. Evans, 333 East Third street, Dayton, Ohio; J. C. Vesely, 1657 South Fortieth avenue, Chicago, Ill.; Century Cycle Company, P. G. Wagner, 198 South Main street, Akron, Ohio.

BAKER ON LONG TRIP.

ERWIN BAKER, the Indianapolis rider, is making an extensive trip through Ohio, Pennsylvania, New York, New Jersey and Maryland on his motorcycle. Immediately upon his return he will leave for Savannah, Ga., where he will compete in a 200-mile race late in November.

O. C. Godfrey Taking a Corner on T. T. Indian in English Trials.

ATTENTION MOTORCYCLE DEALERS

¶ We have an important announcement to make to the trade about November 10th, of interest to everybody who is in line for the big business in the big year 1913.

¶ You will want to get it at the same time as your competitor and we want you to have it.

¶ Detach the slip at the bottom of this page and mail it to us today. You will then receive this announcement promptly.

Tests! Tests! Tests!

That's the watchword which reigns supreme
in the making of

"THE COVENTRY" CHAINS

In every process of their manufacture keen inspection and rigid tests are the rule. Not one of the 1,200 operations necessary for the making of a complete length of "The Coventry" Chains is performed without persistent and conscientious scrutiny.

No chain can be "good enough" in "The Coventry" plant. If a chain does not meet every test—if it is not *absolutely perfect*—it is "scrapped." "The Chain with the Nose" has a reputation to uphold—it has a pedigree—that's why it is such a thoroughbred in action.

You, the user, get the benefit of these rigid trials. When you buy a set of "The Coventry" Chains, you know they have made good before they come to you. You know that they are

The Strongest, the Lightest, the Most Enduring Chains on the Market

You know that no matter what road conditions you encounter "The Coventry" Chains can be depended upon to "pull you through." On long steep winding hills, where your motor is taxed to its utmost, and where the slightest "give" or "slip" to your transmission means an ignominious "stall," "The Coventry" Chains bring you safely to the top.

They are a truly dependable transmission.

TO DEALERS

No matter what size stock of "The Coventry" Chains you are now carrying, order more. The 1913 announcements of the big manufacturers show you how popular the chain will be. Hurry!

\$15.00 SUIT FOR \$8.00

THE
NATHAN
KOVERAUL

Mackintosh Suit for Winter Wear and all around service. Specially selected by Carl S. Clancy and Walter Storey, his partner, for their tour around the world.

Read His Letter, then Our Offer

Philadelphia, October 5, 1912.
Nathan Novelty Mfg. Co.
84 Reade Street, New York City.
Attention of Mr. Nathan.

Dear Mr. Nathan:
It has occurred to me that you would probably like to have a photograph of Mr. Storey and myself as we start off on our tremendous around the world journey

equipped with your "Koverauls," and also to know why we chose these garments for this tour. After completing our supply of extra parts, tools, camping outfit, etc., we found that we had very little space left for wearing apparel, and that we would be able to carry but one suit with us. On this account we had to protect these suits absolutely from dust, rain and dirt en route, and after investigating the outfitting market we found that your "Koverauls" were the only garment that would fill our needs. We will have to make many business calls and be frequently at hotels where good appearance is essential, and we are sure that your "Koverauls" are the only protection that will accomplish this purpose.

Wishing you the wide-spread sale which your product deserves, I am
Yours very truly, CARL S. CLANCY, per M. E. P.

SPECIAL OFFER. Good Until Nov. 15 Only

We will send you, prepaid, the \$15.00 Nathan Koveraul Suit made of mackintosh for \$8.00 in cash or money order and refund your money if you are not satisfied with it and for this reason return it to us.

We have only a small number of these suits which we will sell at this price. Enclosed find for which ship by exp. or fut., prepaid, suit as advertised, with the understanding that if not perfectly satisfied I may return it (them) within 10 days from receipt of shipment and you will refund my money. Give chest, waist and inside leg measure.

The Neverout
TRADE MARK

**Gas Lighting
Outfit**

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

For sale by leading dealers. Made only by

Brown Scientific Non - Deflating Pneumatic Tube

AN AIR FILLED MOTORCYCLE TUBE POSSESSING VERY UNUSUAL FEATURES:

First: It withstands a tread puncture without deflating the tube.

Second: The higher the pressure the tighter the puncture closes.

Third: It eliminates the risk of destroying casings by reason of punctures.

Fourth: The danger of loss of control of machine is removed.

Fifth: It assures you of not being obliged to repair a puncture on the road and gets you "there and back" on full tires.

AIR FILLED ONLY

Punctures are self-closing by reason of a scientific but simple principle of construction.

**NO "DOPE," GUM, PASTE OR OTHER
STUFFING MATERIALS.**

Write for prices, full description and sectional sample.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

WE'RE ALL UPSIDE!
It is only a short time since we put our new NIGHT-GLASS OIL GAUGE on the market, but we have been fairly overwhelmed with orders. Not that we can't make deliveries! But the rush of orders has so far exceeded our expectations that we have to keep on the jump to fill them.

When writing to advertisers, please mention **MOTORCYCLE ILLUSTRATED**.

"Whitney" Chains Are Built For Strains

Every "Whitney" Chain has a reputation back of it, a reputation of having been tested in the most trying service and never failing to make good. We've made chains for years and through our untiring efforts to produce nothing but the best our chains have gained a remarkable reputation. You can't go wrong by placing a "Whitney" on your machine.

When making replacements insist on a "Whitney" and get acquainted with its merits.

The Whitney Mfg. Co.
HARTFORD, CONN.

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

The Electric Welding Products Co.
Cleveland :: :: Ohio

Our Progressive Platform

1913 is some distance away, but we are getting ready for it now, and we don't need a telescope to see that it will be the best year yet.

Between ourselves, the 1913 SEA LION and WHITE STRIP Belts are wonders. We have watched the 1912 belts all the year and where we found opportunity for improvements, they have been made.

We could take up a lot of space telling you WHY SEA LION and WHITE STRIP Belts are the best, but you want proofs. Ask any one of the big motorcycle manufacturers, Harley-Davidson Motor Co., for instance (and you know they use only SEA LION), and see what they say. They know, if anyone does.

Our policy of co-operation with our dealers has met with such success this year, that we are going to expand that policy and want every 1913 dealer to get in touch with us. It will mean bigger profits for you, and your success is our success.

TO THE
POINT**

THE BREAKER STRIP

in the

Diamond

29" x 3" Motorcycle Tire—and the only motorcycle tire that has a breaker strip.

That breaker strip is the point. A point that no motorcycle rider can afford to overlook.

It means increased mileage, lower tire expense, and vastly increases the easy riding qualities of your machine.

It automatically takes care of overloading. It distributes shocks over a wide area instead of confining them to one spot and thus causing a fabric break and subsequent blowout.

Write for booklet.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

**Visible Gap Spark Plug
Tells Its Own Story**

It simplifies the trouble hunt by half

If there is a spark in the window, but proper ignition fails, you know the points are fouled. In that case, just turn the knurled micrometer nut at the top of the plug with the fingers, and separate the visible points still more. This increases the intensity of the spark, breaks down all oil or carbon deposits and automatically cleans them in a jiffy. And if there is no spark in the window, you know you must look to coil, batteries or magneto for your trouble. By this micrometer nut you can also adjust each plug so as to give maximum sparking efficiency.

You need a set of these plugs in your motor. Send for a set now, enclosing price and size wanted (or tell make of machine) and we will forward them at once, prepaid.

The price is only \$1.00.

THE CORBIN LINE OF BRAKES AND HUBS

Corbin Band Brake

FOR MOTORCYCLES

Nearly 50 per cent. of all motorcycles made in America today are equipped with this brake. The 1913 model has two important improvements; a nut-lock is formed by two projections on the end of the arm connecting band, securely holding the nut from turning or jarring loose; a bracket attached to the lower side of brake arm keeps the band from dragging on the drum or sagging when expanded.

Corbin Two-Speed Coaster Brake

FOR BICYCLES

Invaluable for riding in hilly country or against strong winds. No levers or wires are required to change gear. All parts contained within the hub. Action is automatic. Operated by the pedals. Very simple, strong and reliable. Wide choice of gear combinations available. This brake is a great assistance to elderly riders.

Corbin Duplex Coaster Brake

FOR BICYCLES

Combines free wheel feature with foot-brake action. Operation can be graduated according to the amount of foot pressure applied. Instantaneous action and release. Small and handsomely shaped. Strong, efficient and durable. The best designed and most satisfactory coaster brake without two-speed feature.

Corbin Front Hub

FOR MOTORCYCLES

One of the most practical and efficient hubs made. Ensures free and smooth running. Best steel ball bearings. Knockout axle combined with this hub. Heavy, strong and reliable.

Corbin Front Hub

FOR BICYCLES

Very efficient, ball-bearing hub. Strongly and simply made. 32 and 36 spoke holes in stout cones. The standard bicycle front hub of the world.

Corbin Bicycle Brakes and Hubs can be fitted to your wheel by any bicycle repair shop.

THE HOME OF "THE COVENTRY" CHAINS

EFFICIENCY!

Perfection in materials, in workmanship—these make for that one attribute which interests the user most—Efficiency in action. And that's where

"The Coventry" Chains

have time and again demonstrated their supremacy.

Combine practically limitless capacity with manufacturing facilities "tightened" down to the last possible unit of efficiency, and you have the basic reason for the uniformly high quality of "The Coventry" Chains.

*Let us tell you more
about them*

Sarco Engineering Co.
112 Broad St., N. Y.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

“It Makes Us Laugh!”

IT IS TO CHUCKLE! The childish efforts on the part of the makers of another type of transmission to stem the onrushing popularity of the chain-drive as the logical 1913 transmission, awakens in us nothing but deep, heartfelt and sincere amusement.

IN THEIR DESPERATE ATTEMPTS to ward off the inevitable they have committed the lamentable error of grossly under-estimating the intelligence and discrimination of the motorcycle public at large. They have frankly intimated that the rider doesn't know what he wants!

THEY PRATE ON ALIGNMENT, economy, on shocks and jars. Is it possible that they think so little of the rider's common sense as to attempt to make him believe that a transmission that continually slips and gives—a transmission that loses about 160 feet every minute through slippage—not to mention the wasted gas and oil as well as the wear and tear on the motor—is more **economical** than a positive chain drive—a drive which transmits **all** the motor's power with no waste whatever of gasoline or lubricant, and drives the machine farther with every revolution?

IT'S REALLY FUNNY.

THERE'S A PRINCIPLE IN engineering which provides that the smaller the leverage on a fixed point, the harder it is to move that point. For instance, if you were asked to pull the rear wheel of a chain-driven motorcycle out of line, you'd grasp the wheel by the tire rim, wouldn't you? You wouldn't be foolish enough to try and bend that wheel out of line by grabbing the chain sprocket. Of course not! It's easier to bend the wheel nearer the top. You get more leverage. Think this over carefully, and then ask yourself if the chain-driven motorcycle is the easiest to get out of line.

AND THEN THAT INFANTILE prattle about the chain being a harsher transmission! We appeal to your sense of humor. Obviously, in their estimation, the **FREE ENGINE MULTIPLE DISC CLUTCH** is only an ornament! They carefully overlook the fact that the Multiple Disc Clutch absolutely absorbs all transmission shocks; that the rider of a chain-driven motorcycle today can, with the aid of the Clutch, start and control his motorcycle as slowly, smoothly and flexibly as he would an automobile.

WE HAVE AT OUR command “harsh,” solid, substantial figures; figures which conclusively prove the chain's superiority over any other form of transmission yet devised. But the best proof of all is that election returns for the 1913 transmission show an overwhelming majority for the chain—the leading manufacturers' specifications show it, and certainly the most successful and the largest manufacturer of motorcycles in the World, the Hendee Manufacturing Company would not equip its entire output of 35,000 motorcycles with chains if it were not convinced of the chain's undoubted superiority.

Can't we afford to laugh?

Sarco Engineering Co. 112 Broad St., N. Y.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4	\$6.05	28 x 2 1/2	\$7.43	29 x 2 3/4	\$8.15
26 x 2 1/2	6.60	28 x 2 3/4	7.70	29 x 3	8.25
28 x 2 1/4	7.15	28 x 3	7.98		

Other sizes on application.

Ask Your Dealer for "Bricton" Detachable Treads

Ask the best dealer in your town to show you the famous "BRICTSON" Guaranteed Detachable Tread. If for any reason he cannot supply you, fill out the attached ORDER BLANK, pin your check to same, mail it, and I will ship you the treads on TEN DAYS' FREE TRIAL, and if you don't find them perfectly satisfactory within 10 days from receipt of treads, return them and I will cheerfully refund your money. The Yale for 1913

A MOTORCYCLE FOR CONSISTENT SERVICE

IN the 1913 models of the Yale are offered the most perfected motorcycles that have ever been produced. Price has been a secondary consideration in making the Yale, with every detail the very best that brains and skill can make it. As a result, the Yale must sell for a higher price than most other motorcycles, but the buyer's expense ends with the purchase price. There is no continuous aftermath of expense for repairs and replacements. A Yale sale makes a Yale booster, for the rider has such a good machine that he can't help talking about it. He paid a fair price for quality and got surplus value for his money.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

A Big 5-6 Single and a 7-8 h. p. Twin

ALL the energies of our big factory organization are to be concentrated on just two models for 1913. One is a big 5-6 horsepower single-cylinder, the other a powerful 7-8 h. p. twin. All machines will be regularly equipped with three-inch tires—the same size that is used on automobiles that weigh 1,000 pounds more.

The famous Y-A shock absorber is furnished to eliminate rear-wheel jars, and the Eclipse free-engine clutch is standard on all Yales. It is the most thoroughly tried and satisfactory device of the kind that is made.

New twin Yale, with two-cylinder motor of 61 cubic inches piston displacement. Heitger improved carbureter. Bosch armored magneto. Eccentric yoke allowing independent adjustment of pedal chain and belt or drive chain. Three-inch tires, Goodyear, U. S., Federal, or Diamond, with big clearance to permit use of chains and prevent clogging with mud. Hinged mudguard makes easy removal of rear wheel. Wheel-base 57½ inches. Troxel or Persons saddle. Y-A shock absorber, "the original jolt-killer." Yale triple-stem spring fork with forksides extending all the way up and connected to handlebars by substantial forging. Yale grip control, with independent exhaust lift from lever under right grip, giving more perfect control of motor. Spark and throttle stay where set when hand is removed from grip. Standard rims with extra heavy spokes, 38 front, 40 rear. All frame fittings are drop forged—no cheap stampings or malleable castings to give way under hard strain.

Gas is furnished to the cylinders by a Heitger carbureter made especially to suit the requirements of Yale motors.

Every single item from motor down to spokes is absolutely the best that expert mechanics can make or money can buy. There has been no skimping and no sparing of expense to make Yale quality mean perfection.

Twin Power with Simplicity of a Single

THE new 5-6 h. p. Yale is the first machine to meet effectively the demand for the immense power, rapid acceleration, and hill-climbing ability of a big twin combined with the mechanical simplicity and freedom from complication of a single-cylinder. Though containing so few parts and so simply made that anyone

The new 5-6 Yale single is unequalled for all-around service. The highly efficient long-stroke motor develops close to 6 H. P. and is so simple that it is practically impossible for it to get out of order. Aside from the motor this is the same as the twin—same substantial frame, graceful lines, three-inch tires, big mudguard clearance, hinged mudguard, Y-A shock absorber, and Eclipse clutch.

can learn to handle it in a few minutes, the new "Big Y" single has power that shoots it up the steepest hill without hesitation, and the way it plows through deep, sticky mud or heavy sand is a revelation to the man accustomed to the old 4 h. p. models. Also, the far greater power

that this new motor exerts at low speeds allows the rider to travel slowly through sand, or in "ticklish" situations such as a sharp turn on a steep hill, without danger of stalling the motor.

For the new rider who wants a machine that he can handle perfectly without previous practice or for the veteran who wants a motorcycle with invincible power but free from the troubles he has met in other machines, the Yale single is the solution.

A 61-Inch Twin of Supreme Efficiency

THE power plant of the Yale twin model has proved itself the most efficient gasoline motor ever put in a road machine. For power, speed, flexibility and perfect evenness of running this has never been approached. It is rated conservatively at 7 horsepower, but on actual test with instruments of most precise accuracy, these Yale twins average 9.2 horsepower—some of them pull considerably above this. There is power to climb with the speed of a rocket the steepest grade that you will ever meet. The rider of a Yale twin need take no one's dust on the road, for at his command

Showing the left side of the big twin with chain drive. The Eclipse clutch is located on the counter-shaft, where it gives smooth, efficient action, superior to any other location. Drive by chain or V belt, with Eclipse free-engine clutch operated by lever on left side, which engages clutch as it is drawn back. Quadrant for lever fastened to lower frame bar—no strain on side of tank. New footrests shown, with foot lever for operating brake when feet are on rests. Choice of Corbin band or Eclipse multiple-disc brake.

is greater speed than anyone dare use. The nerve and skill of the rider is the only limit to the speed of a Yale twin. Yet for city riding or leisurely traveling, the motor will throttle down to a walking pace, and will fire evenly and sweetly at 4 miles an hour. The horizontal cooling flanges let the air circulate directly across both cylinders, so that the motor cools perfectly at all speeds, even when the engine is raced with the clutch partly disengaged and the machine moving slowly for some time, as when negotiating a long stretch of sand.

Superior Balance and More Road Ability

YALE riders are able to use the power of their high-efficiency motors and can maintain a greater speed over all kinds of roads than other motorcyclists because the balance and "hang" of the machine is so perfect that it is far easier to handle. The new frame lines give an exceptionally low saddle position, well

Drive side of the big 6-6 Yale single with chain drive. Eclipse clutch on countershaft, with positive lever control. Clutch engaged when lever is pulled back; free in forward position. Footrests with auxiliary foot lever to operate brake. Brake can be applied either by back-pedaling as usual or by pressing auxiliary foot lever when using footrests.

forward between the wheels, and the motor is hung so that the center of gravity comes very low, without sacrificing road clearance. All strains are taken along straight lines, so that there is no chance for bending or breaking, the Yale frame tubes, with double

D-tube reinforcements forming a central wall, making a frame immune to all strains a motorcycle ever receives.

Also, note the lines of the new Yale. It is the raciest, classiest, most competent-looking machine in the field, both for lines and finish. And it continues to look good, for all nickelplating is on copper so that it does not rust, and the enamel is of a quality that low-priced machines cannot afford. It wears long, holds its color, never chips off, and does not fade or grow dull after long service.

Quality First Requirement of Yale Policy

QUANTITY with a big Q is the first requirement on every part of every Yale machine. Design, material, workmanship—all are the very best that ingenuity, experience and skill can supply. After making the 1913 Yale absolutely the best that a motorcycle can be made, we figured what it must

One of the belt-driven 1913 Yales. On the single cylinder model there is choice of chain or flat belt. The twin has chain or a big V belt—no flat belt of size suitable for a motorcycle would hold this powerful motor satisfactorily. Both belt and chain models have the Eclipse free-engine clutch as regular equipment.

be sold for, instead of setting a low selling price and then making the quality of the machine measure down to that mark—using low grade material and cheap labor to keep down cost so that a profit could be made selling at a low

price. Our policy makes the Yale prices somewhat higher than those of several other machines—but it gives the man who buys a “Big Y” a great deal more for his money. When he pays for a Yale his expense is ended. He does not have to pay in repair bills many times the amount that a cheap maker saved by cheap construction.

Sterling silver costs much more than plated ware, but everyone admits its value is greater. The same is true of Yale motorcycles.

Sales Ammunition for Yale Dealers

NEVER before have any motorcycle dealers been provided with such sales ammunition as we are furnishing Yale dealers for 1913. The "Big Y" is a motorcycle without an equal, the greatest value per dollar invested offered to the buyer, and the Yale is hammering this fact home to millions of people all over the country by the most tremendous campaign of national advertising that any motorcycle maker has ever attempted. No other maker has cared—few could afford—to put \$125,000 into a series

Valve side of new Yale single-cylinder motor. Develops nearly 6 H. P. Improved Heitger carburetor. Inclosed Bosch magneto. New mechanical oil pump of plunger type. Auxiliary hand oil pump. Mechanical inlet valve, with separate cam for independent timing. Big bearings with bushings of special metal.

of smashing page and double-page ads in the Saturday Evening Post to bring the motorcycle up to the automobile in public esteem and to drive the great masses of people who need motorcycles to the stores of the dealers. But the Yale is doing it. The Yale has the money, and has the faith in the future

of the motorcycle to put this money to work for the dealers. The Saturday Evening Post campaign is succeeding wonderfully. The first big double-page of the series, published Oct. 19th, is still bringing results in a steady stream. That big ad will make itself felt at the stores of Yale agents all over the land for months to come, and in the meantime other big advertisements of this series will be issued, and will be bringing more business to the dealer. Advertising of this sort is cumulative as well as direct in effect, and each ad will be stronger because of those that have gone before, so that the stream of business coming to the Yale agent will be constantly broadening and deepening.

Valve side of the Yale twin motor. The most efficient engine made. Bore, $3\frac{1}{4}$ inches; stroke, 3 43.64 inches. Piston displacement, 60.92 cubic inches. Develops 9.2 horsepower on block test—not "calculated" or "estimated" power. Improved Heitger carburetor designed specially to fit requirements of this motor. Inclosed Bosch magneto on all motors. Lubrication by new worm-driven mechanical oil pump of plunger type that supplies oil in proportion to speed. Hand pump for emergencies or speed work. New mechanically-operated inlet valves with overhead rocker arms and pushrods. Exhaust and inlet cams separate, allowing independent and accurate timing. Horizontal cooling flanges, so that air circulates freely over surfaces of both cylinders instead of being deflected by front cylinder and allowing rear to overheat—an exclusive Yale feature. All bearings of unusual size, giving long life and freedom from friction. Bushings for bearings made of special bearing alloy that is proved by test to wear longer and run smoother than any other kind.

Yale Agency a Chance for Big Business

The Yale spring fork made an unequalled record for service in 1912. Not one single fork was broken. The substantial way this fork is made, with forgings used at all points of strain, accounts largely for its superiority. For comfort and ease of riding this fork is a wonder. It smoothes out all the road bumps and cuts out front-wheel jars. The slant of the front fork is so designed that there is a trailing effect, and the wheel passes over bumps and obstructions more easily and with less shock than in a fork of the castor type where the axle is back of the fork tips.

HOLDING a Yale agency means a chance of big business. Backing the agent for the "Big Y" is the powerful sales and advertising organization of the Consolidated Manufacturing Co. Without spending a cent the agent reaps the benefit of the company's tremendous \$125,000

All Yales are equipped with the famous Y-A shock absorber, "the shock absorber that absorbs shocks." Two big springs take up every road jar, large or small, thoroughly insulating the rider from all effects of rough roads. The design absolutely eliminates side play, which makes a machine with the ordinary spring seatpost hard to handle in difficult situations. There is none of the weakness that characterizes spring frames—no joints to wear and destroy alignment. The Y-A shock absorber is the most successful device yet made to smooth out all rear-wheel jolts.

campaign of national advertising. His success is assured beforehand, he has not a chance for failure—not even a chance for merely lukewarm success. Yale agents for 1913 will do big things, will succeed in a big way, for that is the Yale method now. We are going to keep on with our immense publicity work, for already it has shown astonishingly big results. And the Yale agent is the man who will gain most directly by this. Prospective buyers will be brought into the store without an effort on the agents' part, with the desire to own Yale motorcycles already created in their minds, and closing the sale will be easy for a salesman who is at all alive to his opportunities. And for 1913 we want Yale agents to be 100 per cent. live wires. The few who do not measure up to this standard will be replaced with men who are wide awake.

If you are not already a Yale dealer, think this over. You cannot afford to let anyone else sell the Yale in your territory. Possibly you can arrange to represent us there. Write us at once and find out. Our proposition interests all real hustlers.

Make your motorcycle a 24-hour servant

Dare you ride your machine any time and place you please? Or does nightfall catch you worried and anxious, creeping along in fear and trembling?

If so, you're missing most of the fun of motorcycling—you're tied down to the daylight limit.

But—a **RELIABLE** source of light, with a lamp large enough, will make your night riding pleasant and **SAFE**.

Oil lamps won't do—gas generators won't fill the bill either—they're unreliable and troublesome. What you need is a brilliant, unflickering light, that floods the road ahead, searching out every bump, rut, puddle and other source of dangerous spills.

Prest-O-Lite Owners

Several motorcyclists who appreciate the never-failing Prest-O-Lite Motorcycle Gas Tank. Reading from left to right: Michael Westcott, R. O. Shelling and C. D. Feiler; taken in Delaware City, Delaware.

HERE'S THE ANSWER!

Prest-O-Lite Motorcycle Gas Tank

This is your only source of satisfaction—because it's the **only PRACTICAL** lighting system for motorcycles.

It means a **brilliant** and **RELIABLE** light for you—steady under all road conditions. Turns on and off like a gas jet. The neat, attractive nickel-plated Prest-O-Lite Tank will add to the beauty and service of your machine, without adding materially to the weight.

Prest-O-Lite is not expensive. The money you invest in the tank itself is not *spent*, because a genuine Prest-O-Lite Tank never becomes second-hand, is always in demand—it's a ready cash asset just like money in the bank.

And any experienced rider will tell you that Prest-O-Lite exchanges cost no more, usually less, than the carbide to feed a generator. Wherever you may be, exchange service can be had from one of our 20,000 dealers (motorcycle and automobile). We will arrange for prompt exchange service for anyone anywhere.

You shouldn't deprive yourself of the added pleasure and convenience Prest-O-Lite will give you. You can't afford to do without its **SAFETY**. One accident due to poor light will cost you more than a year of Prest-O-Lite service.

Price of Tank \$10

(Equipped with Gauge)

Dimensions: Length, 13 $\frac{1}{4}$ inches; diameter, 4 inches; weight, 8 $\frac{3}{4}$ pounds. 40 hours of light. Easily attached to any motorcycle.

Just a Word on Imitations

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one, **ANYWHERE** and **ALWAYS**. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

The Prest-O-Lite Co. 246 E. South St.
INDIANAPOLIS, IND.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Mr. Dealer! There's a good profit in Prest-O-Lite Tanks and Exchanges. You may as well be getting it, for a simple statement of the facts about the Prest-O-Lite Motorcycle Tank will make the sale. And remember it's a bad idea to get your customers into the habit of going elsewhere for their Prest-O-Lite Exchanges if you want their trade on other things.

Before Mr. and Mrs. Gale started on their eventful transcontinental trip they debated long and earnestly on what tires to use. After drawing upon his years of experience as a motorcycle rider, Mr. Gale emphatically voted in favor of

CONTINENTAL-ERIE TIRES

That their choice was a wise one has been proven by the triumphant completion of their journey through every imaginable road and weather condition, all of which Continental-Erie Tires went through "with flying colors."

Dealers—Get our 1913 proposition.

1913

Thor

1913

It has been universally acknowledged by the motorcycle world, manufacturers, dealers, and riders alike that the THOR motorcycle manufactured by the AURORA AUTOMATIC MACHINERY COMPANY, Aurora, Illinois, is the most complete, mechanically perfect motorcycle ever manufactured. While we have never been able to keep up with the unusual demand this past year, we can safely say every motorcycle turned out of our factory is absolutely perfect. It is honest all the way through, both material and workmanship. It is built to give credit to the name THOR and the designers back of it.

This coming season the main question is DELIVERIES. Realizing the importance of this question—so important—as has been proven this past year we commenced active operations in completing and testing 1913 sample models last July. We immediately placed contracts, orders, etc., for our product and have today over \$300,000.00 worth of raw material in our warehouse and factory, half of which is in actual productive operation. This fact alone will prove to you we intend manufacturing motorcycles, and the THOR will hold its place as the FIRST MOTORCYCLE in the World and the FATHER OF THEM ALL.

Model "13-M" \$225.00

This 4 H. P. model is the fastest single cylinder ever manufactured. This is even faster and more powerful than our previous models of same size.

Bore, 3.25; Stroke, 3.00; Displacement, 30.50 cubic inches. Roller bearing connecting rods; Mechanical overhead intake valves with Thor ball and socket joints; Carburetor; Thor improved twin air adjustment and butterfly valve; Bosch armored magneto; Thor undergeared internal gear direct chain drive; Thor improved ball bearing free engine clutch; Wheel base, 58 inches; Control, Thor improved double grip positively perfect at all times. Standard tire equipment, 28x2½, United States, Goodyear, Empire or Diamond. Motor is mechanically oiled with the new Thor perfected force feed, oiling crank case direct. Two Speed and Two Speed Control, \$40.00 additional to above.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

1913

Thor

1913

Our 1913 models are especially prominent owing to superior quality and interchangeability. THOR Quality applies both to material concerned and workmanship performed. The best material which can be purchased, both in this country and abroad, alone is used. The quality of work performed on the material is only of the highest type.

The organization which makes THOR superiority possible consists of competent corps of engineers, who have at their disposal laboratory apparatus for research work, such as is seldom found in motorcycle building factories. Only such machinery as is recognized in the trade to be the best for the purpose, including many special machines, is employed and operated by expert mechanics to whom we attribute our success.

Model "13-W" \$240.00

For the rider wishing a motor of tremendous pulling power on slow speed but capable of speeding up when desired—a better motor can not be made. This 5 H. P. Motor with Bore, 3.57; Stroke, 3.80; Displacement, 38½ cubic inches. This motor is also roller bearing throughout. Standard tire equipment, 29x2½, otherwise the same improvements throughout as the 4 H. P. Special attention is called to the larger cylinder; larger radiating fins and exhaust chamber, thus eliminating all possibility of overheating. Two Speed and Two Speed Control, \$40.00 additional to above.

Model "13-U" \$290.00

The most perfect and fastest stock twin in the world, unlimited power and speed. This 7 H. P. Motor with Bore, 3.25; Stroke, 3.60; Displacement, 61 cubic inches. Cylinders are set upright 50 degrees apart. This motor is also roller bearing throughout. Standard tire equipment, 29x2½, otherwise the same improvements throughout as the 4 H. P. The improved clutch on this model is just what is wanted on this high power machine. Two Speed and Two Speed Control, \$40.00 additional to above.

Works: Aurora, Illinois

The best built Motorcycle in America.

The A-M-C is a real 1913 model from start to finish, but its designers are among the oldest in the business. In building the A-M-C there has been no necessity for adhering to former features. We have been entirely free (and frankly admit having done so) to copy the best and time-tried features embodied in the highest type of machines of both Europe and America. Its up-to-dateness is reflected in every detail.

The refinement and harmony of lines removes the influence of ordinary motorcycle construction and the A-M-C comes forth as the final expression of the most attractive and mechanically correct machine for next season.

Dealers who handle the A-M-C will make money—be one of them. Perhaps we can arrange it—the opportunity is at least worth a wire or special delivery letter.

Contracts are now being closed—you will have to hurry. If you are now handling motorcycles and not considering a change it will do you good to get our proposition anyway. We have what you will consider, and we know to be, the greatest selling line of motorcycles in the history of the industry. Machines will be delivered on time; no excuses to offer or lost sales.

**"YOU CAN SMILE AT
THE MILES OF OIL!"**

That's what you can tell your customers when you sell them the only one make of tires in the world that are immune from *oil disease*.

PENNSYLVANIA *Oilproof* VACUUM CUP TIRES FOR MOTORCYCLES

These are the tires to sell during 1913—the trouble-proof tires.

Well over 80,000 new motorcycles will be produced in this country the coming year. Add these to the thousands and thousands already on the road and think of the wonderful volume of tire sales!

It needs no great effort of the imagination to see that a huge bulk of these sales will and must swing over to the tire that's trouble-proof.

All PENNSYLVANIA Motorcycle Tires now on the market are Oil Proof. They resist the ruinous effects of oil which rots other tires by soaking into the pores and small cuts from oiled roads and streets. The tread has been toughened in the treatment. It's practically a puncture proof tire.

All this is added to the sensational anti-skid and longer service qualities which during the past few seasons placed Pennsylvania Tires where they are—highest in the regard of all motorcyclists who know the difference.

Keep on pointing out that difference. Push along the unbeatable "oilproof" feature. Get your due share of sales. "Oilproof" is a magic word. Emphasize it for Sales—Profits!

MODEL H, \$165

"BIG 4" - \$200

"TWIN" - \$250

Pope Line a Winner—Every Model a Wonder

In the Pope line there are three distinct models. Model H, the popular lightweight; Model K, the Pope "Big 4"; and Model L, the Pope "Twin". Each motorcycle is a sure winner in its particular field. Prices are right. Magnetos standard equipment on all models.

MODEL H is a light, high-grade practical machine—reliable, efficient, and reasonably fast. Sells at a popular price and is in great demand.

MODEL K is a powerful, speedy "single" with many important and exclusive features. It has a combination clutch and idler operated by one lever, offset cylinder, eliminating dead center, and **overhead valves**, giving it an abundance of power for speed and hill-climbing. The new Twin which will be ready early in 1913 completes the Pope line.

We have the Product, the Plant, the Organization, the Experience, the Resources, and the Reputation to co-operate with our dealers to the very fullest extent.

Extract from "1913" INDIAN Announcement

"All 1913 Indians are equipped with $2\frac{3}{4}$ -inch tires as against the $2\frac{1}{2}$ -inch tires of 1912. The widening of the forks, both front and rear, also allow for the use of anti-skid chains in addition to the larger tires."

Other manufacturers are doing likewise because Weed Chains are recognized as the only device to absolutely prevent skidding. They afford perfect traction in sand, mud or on wet slippery pavements and roads.

This is what Veteran Automobile Drivers and Seasoned Motorcycle Riders say about Anti-Skid Chains.

Mr. Geo. H. Robertson says—

"I believe that everybody who drives a car has at one time or another had some experience with 'skidding.' The driver of a machine has all kinds of conditions to deal with. Some are more dangerous than others; but the everlasting, ever-present danger is skidding.

"All kinds of devices have been invented, and most of them have gone the way that most novelties do, because novelties as a rule do not serve a practical purpose, but inventive genius was persistent and the non-skid chain was finally evolved and it alone has done more to raise the safety and hence the pleasure of driving, than anything else. I believe I might safely say that I have tried everything, but I have never been satisfied by anything else as I have been with chains."

Photo of Mrs. Gale alone, with motorcycle before Mr. and Mrs. Gale's ascent of Pike's Peak

Mr. and Mrs. Gale, that intrepid pair who have just completed their transcontinental trip, during which tour they ran the gamut of roads absolutely indescribable in their wretched condition, cheerfully admit that were it not for Weed Chains, disaster would have overtaken them many a time.

Gale says: "'Pike's Peak or Bust,' without Weed Chains on these roads it would have been bust for ours." And Gale ought to know for he has probably more difficult tours over awful roads to his credit than any rider in this country.

Weed Anti-Skid Chains

With the "Creeping Grip"

Give perfect traction, prevent sliding and slipping. Make motorcycling absolutely safe—sixty miles an hour with perfect safety—make all roads good roads.

The continuous "creeping" prevents injury to the tires and keeps them clean, minimizing the chances of punctures.

The secret process of hardening the cross chains, just adopted, gives extreme lasting qualities.

Light and easily carried, as the small bundles they make in their canvas bags take so little room that they could be carried in your pocket, when not in use, without inconvenience.

COMFORT AND

¶ The dealer of to-day has to cater to prospects of every character his prospective buyers. Any features of his machine that will represent a percentage of sales. There is no question that a motorcycle superior in power and speed has a decided advantage with a buyer. It is a requirement in the highest degree is the most satisfactory both for the following comparative facts before deciding on the transmission.

Comfort

¶ Smooth operation is a feature of motorcycle riding that paves the way to physical comfort. The transmission often makes the difference between this desirable feature of riding and the reverse—progress by a series of unpleasant jolts and shocks. This is particularly the case when riding conditions call for a change in the rate of speed. The rider of a belt driven machine, in contrast to machines with other transmission, experiences no discomfort from any irregularities of motor operation; for example, should he accelerate his motor or suddenly close the throttle, the flexible belt will take care of the resulting change of speed and no shocks will be felt. If the rider should let in his clutch or speed up his motor too abruptly, or if from any other cause the load thrown on the power-plant should be too great, a slight slipping of the belt would prevent any jerks.

¶ If difficult hills cannot be negotiated by a single steady surge from base to top, the flexibility of the belt will permit of the machine being driven up by a series of spurts. With a more rigid type of transmission, spurting can only be done at the expense of extra wear on the clutch surfaces and excessive strain to the frame.

¶ Should the motor stop suddenly, the belt will slip, usually sufficiently to enable the rider to keep his saddle. A more rigid and consequently harsher form of drive may be the cause of a serious and expensive accident to either the mount or rider, as the clutch is the only means of relieving the tension.

The Graton & Knight Manufa

MANUFACTURERS

SPARTAN

EFFICIENT, ECONOMICAL, CLEAN AND COMFORTABLE,—THE TRANSM

CLEANLINESS

ter, and overcome all sorts of objections in making customers of
sult in a higher degree of satisfaction to the buyer mean a greater
rior in comfort and cleanliness to another of the same relative horse-
obvious that a machine with a transmission possessing these two
r the rider to buy and the dealer to sell. Read well, then, the
ou are to advocate.

Cleanliness

¶ Belts require less frequent lubrication than chains. Although both forms of transmission should receive proper care and attention, a belt can be more or less neglected in the matter of lubrication, while an equivalent amount of neglect to a chain would result in excessive wear and a quick ultimate ruin.

¶ While the belt lubricant is usually in the form of a jelly-like dressing put up in convenient flexible tubes, and can be applied without any appreciable soiling of the hands, the chain requires a thorough cleansing, then a soaking in a thin lubricant or oil—a very grimy process at best. While the belt dressing adheres to the belt surfaces and does not fly about, the chain lubricant spatters disagreeably when the transmission is in motion, soiling both the rider and machine unless guards are used.

¶ Lubricating the chain is not only a dirty operation, but it requires the removal of the chain from the sprockets. No removal of the belt from the pulleys is required when applying its dressing.

¶ Those who like comfort, together with cleanliness, can, therefore, readily appreciate the advantages of the belt form of transmission.

The
Wayside
Spring

A New Motorcycle Tire CHAIN TREAD

ABOUT a year ago the United States Tire Company brought out the Chain Tread Automobile Tire.

This was the first practical adaptation of the chain idea to a rubber tread, and the tire bounded immediately into universal favor. Motorists found it not only effective as a skid-stopper, but particularly rugged as well, and especially fortified for use under all sorts of road conditions.

The United States Chain Tread

has now been added to our already complete line of motorcycle tires.

Motorcyclists unquestionably will appreciate a tire of this character because of its proven effectiveness as a skid-stopper and its remarkable service qualities.

The Chain Tread gives constant protection against skidding because the chain is built into the tire.

Notice the tread, how thick and heavy it is. There is a lot of wear in it, more than you get from an ordinary tire.

Next time you are buying tires specify the Chain Tread. It will stop your slips and slides, and furthermore it is an exceptionally economical tire to use.

F. A. M. DIRECTORS AT ST. LOUIS

In Long Session Board Makes Salary Adjustments, Reduces Track Franchise Fees, Defines Foreign Racing Policy, Plans English Alliance, Airs Controversies and Receives Denver Application for 1913 Assembly.

ST. LOUIS, November 9.—Seven members of the Board of Directors of the F. A. M. underwent the monotony of train journeys of from ten to thirty hours each to be present at a special meeting here today. Two directors held proxies, so that for the first time in the history of the organization the entire membership of the Board was represented. Incidentally, the directors, who were in session with only one short recess, continuously from ten o'clock in the morning until after midnight, transacted an unprecedented amount of important business and cleared up several apparently hopeless situations.

Features of Busy Session.

The session was featured by the election of Secretary-Treasurer Gibson as secretary ex-officio of the Board of Directors; the determination of the salaries of the chairmen of the Competition and Membership Committees, respectively; an agreement among the directors upon means to facilitate the transaction of business through the mails; reference of the relay race scheme to Chairman Willis, of the Press Committee, and Guernsey Van Riper; the reduction of both board and dirt track sanction fees; hearings to Jack Prince, M. F. Bramley, L. J. Sullivan (anent Thornley), and several of the St. Louis boys in reference to the charges against Referee Hellman, which were not sustained by the Board; a thorough airing of the Dallas mix-up; amendment of the form of the board track franchise agreement, and a decision to have a sliding scale of annual fees on long term contracts; the refusal of the Board to re-open the Kraemer case; the making up of the 1912-1913 budget; the endorsement of Prince as a track builder, etc.

President Patterson was in the chair and Director Sauer acted as secretary *pro tem*. Present were also Directors Willis, Hamilton, Thornley, French and Johnson. Willis held Estabrook's proxy and Thornley that of Collins.

Constant Reinstated.

For competing at two Canadian meets as a trade rider last month on a track where the public was charged admission, J. V. Constant, of Brooklyn, had been declared a professional. Constant submitted a dignified appeal to the Board, and showed that he understood the Canadian F. A. M. agreement to mean that an F. A. M. rider was well within his rights in competing under Canadian rules. Constant did not question the right of the Chairman of the Competition Committee to professionalize him. As there was reasonable room for a misunderstanding of the terms of the alliance with Canada the directors, acting as the Competition Committee at large, restored the amateur status of the Brooklynite.

Foreign Policy of the F. A. M.

At the same time the policy of the organization in the premises was defined. Under the agreement, Canadian riders competing in this country will be considered as amateurs if they

are such under Canadian rules, and vice versa. That does not signify, however, that an American rider can compete in Canada under rules which seriously conflict with those of the F. A. M. However, it is the plan of the Canadian Motorcyclists' Association to have its competition rules substantially conform with those of the F. A. M., and Mr. Sauer was instructed to request the C. M. A. to have the matter in shape by the first of January, so that there can be no further confusion.

Thornley's Salary.

By a unanimous vote, upon motion by Mr. Hamilton, the Board voted to the chairman of the Membership Committee a salary of \$1,040 a year, in addition to expenses for printing and postage.

The much-mooted Thornley salary and expense allowance question was settled after some discussion, as follows: Salary, \$25 a week, contingent upon the amount being taken from sanction fees; allowance for stenographic service, not more than \$20 a week; for rent, heat, light, etc., of the offices of the Chairman, \$15 a week.

Sullivan vs. Thornley.

T. J. Sullivan, sent to St. Louis by a Chicago journal to prevail upon the Board to substantially endorse its attitude towards Chairman Thornley, was given a hearing. No charges having been preferred by Mr. Sullivan, the directors were at first disposed to dismiss the entire matter on the ground that there was nothing to consider. In the end, however, a resolution was adopted in which the F. A. M. directorate expressed its disapproval of the personalities engaged in on both sides, and also declared that Thornley had exceeded his authority in arraigning the motorcycle trade in the much-talked-of Mann letter, the sentiments of which communication were contrary to the views of the directors of the F. A. M.

English Alliance.

Chairman Sauer, of the Legal Action Committee, was directed to arrange a working alliance with the English A. C. U., through Mr. Wells, of London, who was recently delegated by President Patterson to represent the F. A. M. in Great Britain. Mr. Sauer was also instructed to make any arrangements that might be practicable for the co-operation of the F. A. M. Touring Bureau with the American Automobile Association with a view to obtaining for F. A. M. members the privilege of purchasing road maps at special discount rates.

Chairman Thornley was instructed to turn over to the national treasurer the first of each month all funds in excess of a working bank balance of \$500.

A hearing was given on the charges brought against Referee Hellman, of the St. Louis Motordrome. The Board concluded that there was not enough evidence before it to sustain the charges.

(Continued on next page.)

Denver Wants 1913 Assembly.

Through President Patterson, Denver made application for the 1913 F. A. M. meet. No action was taken as, under the Constitution, the matter of selecting a convention city cannot come before the Board

more than 90 days in advance of the date of the annual meet. That Denver will be a strong contender is certain.

The Board laid on the table, to be considered at its next meet, a proposal to send the Chairman of the Competition Com-

mittee to the Pacific Coast. It is probable, however, that some such action will be taken in the near future with a view to permitting the directors to work in complete harmony with Federation leaders in the Far West.

BRAMLEY FAVORS SAUCER CIRCUITS

Well-Known Promoter Outlines Plans Before F. A. M. Directors and Refutes Outlaw Rumors—Clean Bill of Health for Prince; Kraemer Denied Another Hearing by Board—The New Franchise and Sanction Fee Schedule.

ST. LOUIS, November 9.—Board tracks were very much in the limelight at the long session of the Board of Directors of the F. A. M. here today. Messrs. Bramley, Prince and Johnson, the latter a director; the managers of the St. Louis Motordrome, and the ubiquitous Kraemer, were on hand, and all but the latter appeared before the Board. President Patterson sustained the point that the case of Kraemer, who has just been expelled from the organization, could be reopened only by the National Assembly, and that Kraemer, who was very anxious to be heard, would have to wait until next summer.

Prince's Clean Bill of Health.

Jack Prince came before the Board to learn why the impression had gotten abroad that he was persona not grata with the F. A. M. The members of the Board, including Thornley, frankly admitted that they could not understand why such a feeling existed, except that it might be attributed to Prince's having been associated with an expelled member. Not only did the Board make Prince appreciate that its members considered him a crackerjack track builder and an all-around good fellow, but also dismissed the veteran with the assurance that he should have a letter from President Patterson in which the views of the directors would be reduced to writing, so that there could be no further question as to Prince's good standing in the F. A. M.

Bramley to the Front.

W. F. Bramley, who is rapidly becoming a sort of board track king, addressed the directors on a number of subjects having reference to the operation and management of board tracks. Bramley has obtained restrictive agreements for tracks in Kansas City, Detroit, Cincinnati and New Orleans,

and he has applications pending for Indianapolis, Buffalo, Louisville, St. Louis and Cleveland, tracks being already in operation in the latter two cities. Jack Prince had been considering a circuit including Houston, San Antonio and New Orleans, and Bramley offered to waive his rights in New Orleans if Prince needed that city to round out his plans.

Circuits Give Best Results.

Bramley believes that an isolated board track is not, generally speaking, a good proposition. There should be a series, or circuit, he said, to make board track racing permanently interesting to the public, and profitable to the promoters. He emphatically disclaimed even the slightest intention of building up an organization outside of the F. A. M. It had been demonstrated to him that there could be found not a single good reason why a board track owner should even consider an outlaw movement. The F. A. M., he declared, was the board track owner's best friend, not only from a sentimental point of view, but also in every way as a business proposition.

Fees Considered Too High.

It was true, Mr. Bramley declared, that the board track interests believed that the franchise and sanction fees were rather high. As a matter of fact, the directors had come to St. Louis, among other things, to make moderate reductions in these charges and, before the Board adjourned, it was decided to have a sliding scale of fees for restrictive agreements entered into for three and five year terms, as follows: First year, the principal amount; second year, ninety per cent. of the first; third year, 80 per cent. of the second; fourth year, 90 per cent. of the third; fifth year, 90 per cent. of the fourth, and for each year after that, 50 per cent. of the first year's

fee. These reductions apply only to three and five year agreements, and renewals thereof.

New Franchise and Sanction Fees.

The new board track sanction fees are as follows: If only one meet a week is held, \$25, \$10 of which is returned by the chairman to the referee; two meets a week, \$20 a day, \$5 of which goes to the referee; three or more meets a week, \$15 a day, \$5 of which is to be paid to the referee. Dirt track sanctions will hereafter be \$10, instead of \$15, but the chairman will not send out any track paraphernalia. Of the \$10 paid for dirt track sanctions, half is retained by the organization, and \$5 is to be sent by the chairman to the referee when the former receives his report.

Dallas Track Checks Protested.

Chairman Thornley reported that two checks, tendered in payment for a restrictive agreement and for sanctions by the Dallas track management, had been protested. It was ordered that if the checks are not honored and a complete settlement made within 30 days, the franchise be revoked.

Amendments.

The board track resolutions were amended as follows:

First, to provide that promoters of board tracks shall begin work not more than sixty days after the agreement has been made, and that within four months after the agreement has been entered into the track shall be completed and in operation.

Second, that applications for restrictive agreements shall be placed directly before the Board of Directors by the chairman of the Competition Committee. The change was made simply to facilitate the transaction of business.

TO LEARN THE GRADIENT.

STATEMENTS to the effect that hill-climbing is likely to receive more attention from clubs and riders in general during the coming season than for years past lend pertinence to a description of a home-made gradometer which recently came to notice. This device provides a simple means of ascertaining the grade of a hill, and would no doubt prove a valuable addition to the equipment of any clubhouse, even though the organization did not go in for hill-climbing on a competitive basis.

The gradometer is made up of a metal tube about $\frac{7}{8}$ of an inch in diameter, or even a short piece of wooden pole, in which

a small spirit level is set. An upright scale is fashioned in such a way that a clamp—tightened by a thumb-screw—may slide up and down on it, and this clamp is also secured to one end of the tube or wooden piece in which the level is set. The clamp is so arranged that it is, for example, $3\frac{7}{16}$ inches high, from its bottom line to the center line of the tube in which it is attached. On the other end of the tube is a simple bracket, also $3\frac{7}{16}$ inches from its point to the center line of the tube. The point of this bracket is set on the "up" side of the hill and the upright scale before referred to supports the tube on the "down" side. The clamp is then moved on the scale until the level shows that the tube

is horizontal, and the distance from the bottom line of the clamp to the hill surface is then read on the scale. Multiplying the scale reading by 20 will give the per cent. of the grade, if in feet; if in inches it should be multiplied by 1.666. For all ordinary grades the scale should be about 24 inches long and should be graduated for 23 inches.

TWO YEARS OF PROGRESS.

ELWOOD, IND., has a lively squad of Excelsior riders who make regular trips to points of interest throughout the district. They report that two years ago there was not a motorcycle in the town, while today the single trackers are to be seen on all sides.

IVERS reasons may be advanced for giving a motorcycle and its equipment most careful treatment during long tours of our own country, and if this is the case let us consider how much more important it is for an American tourist in Europe to be fortified against emergencies. Take the tire question, for example. Motorcycle tires, in

the abstract, appear to be such ordinary objects—merely rubber covers, with tubes for the harboring of a little air—that even the rider of considerable experience is inclined to underestimate their importance until he is brought face to face with such a problem as confronted us on our recent European tour. I needed tires and could not obtain them to fit my rims, so that instead of being the prosaic rubber casings referred to in the opening of this paragraph they became the most desirable articles imaginable. According to the chaps who keep tab on things historical, King Richard, of England, once offered his kingdom for a horse; what do you think he would have offered for a pair of good motorcycle tires if he were stranded several thousand miles from home with a twin seven?

That was just my predicament, and at the time that it confronted me we were not far from the place at which King Richard made his remark anent the horse. We were in southern France, six miles south of Chambery, to be exact, and 381 miles south of Paris. Both my American tires, which had given excellent service up to that time, went out of commission at about the same point, so that I was called upon to make repairs, push my machine six miles or ride with a flat rear tire. I fixed the front tire temporarily, and rode into the town with the rear casing flat.

Facing a Serious Problem.

Laying aside all jocularities, I really was in a serious position. Upon my arrival in Chambery I learned that one of the Michelin tire factories was located at Lyons, just a few hours by train from Chambery. As the company had no call for tires to fit American rims I was told that I would probably be unable to

procure any, but I was advised to try the factory as a last resort. I did and was informed that no tires were on hand to fit my rims. Then I began a patching campaign, and we proceeded on our way; but I never knew when I was due for another blow-out and a long walk. It was a very unsatisfactory method of travel, to say the least.

I consoled myself with the thought that in the "wonderful city of Paris" everything for a motorcycle would be obtainable, and we rode on as cheerfully as possible. In Paris, however, I found the most peculiar business methods I have ever encountered. All the tire firms, including the very large branches of the different factories, were closed from one and a half to two hours at lunch time, and of course we arrived so that a wait of over an hour was necessary. We were a bit peeved, but as there was no way out of the situation we waited.

Finally the tire branches were reopened and I applied for 28 by 2½ inch casings. At first

days to wait for a pair of tires! There was nothing doing, so we gave up in disgust.

Some time later the Michelin branch located some tires which had metric measurements conforming to the size the tire people said I needed, but when I attempted to fit them to my rims I found they were fully an inch and a half too small. In desperation I took my rims out to the Michelin factory, where I was told that they were an odd size, built for a 2¼ bead, and that they could not be fitted without considerable delay. We decided about this time that our only course was to ship my machine to London, where several American tire firms have agencies, and much as we regretted this procedure we were forced to take advantage of it.

London Tires Fill the Bill.

Once in London, the rider will find that there are five firms manufacturing 28 by 2½ inch tires suitable for our standard rims. There are the Kempshall and Palmer tires, among the higher class goods, and the Continental, Peter Union and Hutchinson tires at somewhat lower prices. The prices of the three latter makes are about the same as those charged for standard American casings, and the first two run considerably higher—though they are said to be worth the difference. As we did not intend to make a protracted tour in England we bought the ordinary tires, Peter Union, and it was well that we did not attempt to do very much riding on them.

I have written this article with a view of impressing upon the American tourist the importance of carrying his own tires, or of making special arrangements with some American manufacturer to supply tires of the proper sizes. The larger American companies have branches in Paris, but as they do not have a call for tires except those designed for European rims they will probably be unable to meet the American tourist's demand unless notice

"The French Manager Said He Had No Suitable Tires."

I was informed that they were in stock and I was jubilant, but a search of the stockroom failed to unearth any casings of the size specified. The manager of the establishment offered to order the tires for me and have them in ten days, but imagine staying over ten

is given in advance. On my next European tour I intend to carry two casings and two tubes. It may be claimed that I cannot transport them on an ordinary motorcycle, but if a chap really wants to carry them in this way he can, and I am going to prove it.

Big

YALE "5"

FEATURED FOR 1913

New single of exceptional sturdiness replaces former 4 h. type; long-stroke motor, mechanical inlet valve, belt or chain transmission—Improvements in twin seven also—Distinctive tank construction in both models for coming season.

FOR 1913 the Yale line will be confined to two models, all the attention of the designers and factory force being centered on these types. There is a 5-horsepower single-cylinder model, at \$225, and a 7-horsepower twin, at \$275, both showing power on actual test far in excess of their rating.

The 5-h. single is, of course, an entirely new model, taking the place of the old 4-h. single. It has a big, long-stroke motor with a me-

mensions to do its work properly, and all reciprocating parts are so balanced as to move with no vibration. The weight of pistons, connecting-rods and pins is balanced with such extreme accuracy by counter-weights on the fly-wheel that the piston reaches the end of its stroke without the slightest shock, and the motor runs as smoothly as an electric engine.

The gas passages are so designed as to give the gas access with minimum resistance, so

to give efficient running at high speed, the motor would fail to hit regularly when throttled down; and conversely, if it were adjusted to run smoothly on low speed, the motor would choke from too rich a mixture when the throttle was open. The Yale intake pipe is three-quarter inches in diameter, in perfect proportion to its bore and stroke.

The Power Developed.

The twin motor has shown exceptional power on block tests. With a testing machine that had been carefully inspected for accuracy, several of these new twin motors were tried out, and the average power recorded was 9.2 h.; a few ran well above this, but none showed below 9 h. While these tests were being made the single motor was run for some time at 4,600 revolutions per minute, while the twin showed 4,200 r. p. m. As very few ported special racing motors show a higher rate of revolution than this, it is considered rather remarkable speed. Only the perfect balance and absence of vibration make this possible.

Lubrication System.

The motor will be oiled by a new mechanical oil pump of the plunger type, driven by a worm gear. This keeps a constant supply of oil in the motor, feeding it in proportion to the speed at which the engine is run. The pump can be adjusted to deliver more or less oil, as desired. A hand oil pump is provided for use in emergencies or for racing. An oil glass in the motor base allows the amount of oil to be observed at any time at a glance.

The gas is mixed by a Heitger carbureter of an improved type, that has been adapted to meet the special needs of Yale motors. The spark is furnished by a Bosch magneto of the armored, or enclosed, type set behind the

Valve Side of Yale 7-h. Twin for 1913.

chanical inlet valve, and on the block at the factory it has averaged close to 6 h. The transmission on this model may be either flat belt or chain, with the Eclipse free-engine clutch as regular equipment on all machines. The flat-belt machines have regulation of belt tension and clutch engagement separate, so that they can be adjusted independently.

More power at all speeds, and especially in running slowly, is a big advantage of the new 5 h. single. As a result, hills that are very difficult for 4-h. machines are easy for the new Yale 5; when riding in sand or mud, where it is necessary to go slowly but where much power is necessary, the power superiority of the new 5 stands out strongly. The transmission on the twin model may be either V belt or chain.

The Big Twin Seven.

The motor of the 7-h. model is a remarkable power plant. The cooling flanges are of the pattern that distinguished the 1912 Yale twins, allowing perfect circulation of air over the surfaces of both cylinders and insuring satisfactory cooling of both.

Another thing that has a great deal to do with the high efficiency of the Yale twin is the perfect proportion of all motor parts. Each is designed and made of just the correct di-

that the fresh charge goes in and the burnt charge goes out of the cylinder quickly. It was found by a good deal of experimenting that too large an intake pipe, by reducing the suction caused by the down-stroke of the piston, would fail to cause a large enough jet to be drawn from the spray nozzle of the carbureter to give a correct explosive mixture; consequently, if the carbureter were adjusted

Detail View of Y-A Shock-Absorber and New Hinged Mudguard.

cylinder where it is well protected. The gears of the magneto train are of nickel steel with a face $\frac{3}{8}$ of an inch wide. These gears are of the helical type, which is found to be more quiet than any other, besides giving better contact.

Distinctive Frame Lines.

The frame lines of the new Yales are distinctive and give a much more racy appearance to the machine. The top frame bar is dropped at the rear to give a very low saddle position, and the shape of the tank is changed. The machines will be finished in gray with blue striping, and there will be a blue panel on the sides of the oil tank. The oil tank is separate from the gasoline tank, now being built behind the seat mast tube. The tank capacities are enlarged so the rider can now carry three gallons of gasoline and a gallon of oil.

An important feature of the 1913 models is the tire equipment. The Yale for 1913 will be fitted with 3-inch tires, the same size that is used on automobiles that weigh a thousand pounds more than the motorcycle. This surplus of strength means longer tire life, less trouble on the road and easier riding, and is, of course, a big advantage to the rider who wants to use his machine for tandem or side-car work.

Plenty of clearance is allowed between tires, mudguards and fork sides, so that tire chains can be used for riding in snow or mud. Also there is no chance for mud to clog up the wheels. The rear mudguard is a new idea for American motorcycles, as it is hinged so it can be swung up out of the wheel for removing the rear wheel. This is of course an immense advantage in making tire repairs or doing other work on the back wheel, and will be appreciated by all riders. A choice is allowed of the Corbin band brake or the new Eclipse multiple-disc brake.

There is a new muffler on the Yale this year that makes it an unusually quiet machine, though producing no perceptible back pressure. The muffler is located back of the motor, exhaust pipes coming to it in a graceful sweep; a cutout placed just ahead of the muffler permits the gas to be given a straight-line exit when the rider so desires, although there is very little gained by doing this as far as power or speed is concerned.

The front fork of the Yale has given unusual satisfaction during 1912. It is an extremely dependable device, smoothing out all road jars in a pleasing manner and standing up under very severe use. Although the Yale has been in the most strenuous endurance contests of the season, and has been ridden in many hard cross-country trips, not one fork on any of the thousands of machines that the factory put out in 1912 has failed. The generous use of drop forgings for all connections, and the substantial construction of the fork, of course, have a great deal to do with this. Therefore, in view of the satisfaction that the fork is giving, no change has been needed in this feature.

Y-A Shock Absorber.

The rear wheel shocks are taken care of as before by the Y-A shock-absorber. This shock-absorber is built on the theory that if

Motor of the New Yale 5 h. Model, Replacing the 4 h. Type.

one spring, as in an ordinary spring seat-post, is good, two springs must be better; and two springs are used to take up the jolts for the Yale. By special construction all side-play is also eliminated, making the machine much easier to handle under difficult conditions.

Yale Publicity Campaign.

The Yale is going strongly to its big campaign of national advertising to put the motorcycle on a par with the automobile in public estimate. The result, of course, will be the creating of a big demand which the Yale dealer can turn into many sales, if he is alive to his opportunities. This big advertising campaign is being handled by one of the most expert men in that line in the United States, Theo. F. MacManus, advertising counsel for the Yale. MacManus' work has made the reputation of several big automobile companies and big industrial firms in other lines.

General Manager D. J. Welsh has found the results of the big national ads used so far more than satisfactory, and is backing up MacManus' efforts in every way. He has planned a factory output of 15,000 Yale motorcycles for 1913, and it is taken for granted that with the big sales and advertising campaign that is now being carried on the orders will run a good deal higher than the estimated output.

Sales Manager Robert Hinds arrived back in Toledo from an Eastern trip about a week ago, after having visited several of the prominent cities and closing up some 1913 contracts. Hinds returned quite pleased, as the outlook was in every way the most promising that he had ever noted; 1913 is sure to be a record year, says Hinds, and he believes the Yale will get its full share of attention.

A TIP FOR DEALERS.

JOE HOLLE, the "Bike Doctor," of San Francisco, transcontinentals this tip relative to the disposition of crates that are received on motorcycles: "Don't throw 'em away," says Joe, "by handling them judiciously you can turn them into quite effective road signs. You will usually find the name of the manufacturers in good-sized letters on several of the boards in each crate and by having a stencil prepared for his own name the dealer can make up his signboard. If the name of the manufacturers does not appear on the crate in large letters, the larger boards may be planed a bit and then painted so that a cheap and catchy sign is produced. We find that these signs serve very well for road advertising."

CAPTURED A HORSE THIEF.

EXPRESSIONS of gratitude are being heaped upon Jack Windon, a motorcyclist of Columbus, Ohio, who recently succeeded in running down Frank Miller, who had been making away with some of his neighbor's horses.

REGISTERED REPAIR SHOPS.

F. A. M. registered repair shops for week ending November 2 were as follows: Neff & Sees, Bird City, Kan., and Leroy Debolt, 208 South Meridian street, Puyallup, Wash.

V. H. WALTHER, of Belleville, Ill., recently rode from Pensacola, Fla., to his home on a motorcycle. He made the trip in thirteen days, covering about 1,000 miles.

NEW EXCELSIORS SHOW MORE POWER

Innovation is Offered in the 1913 Clutch Control and Changes in Timing and Valve Design Afford Greater Speed Without Increased Displacement—Improved Tanks and Other Retinements—Belt or Chain Drive on Both Models.

WITH its facilities increased to permit of a production of fully 25,000 machines for 1913, the Excelsior Motor, Manufacturing & Supply Co., Twenty-second and Union streets, Chicago, announces four models, a 7-10 h. twin and a 4-5 h. single, with a choice of either belt or chain transmission on both. The prices are as follows: Twin-cylinder model, fitted with either chain drive or Spartan belt, \$250; single-cylinder model, same transmission options as the twin, \$200.

The Excelsior 1913 twin motor has the same displacement as heretofore; that is, 61 cubic inches, and that of the single-cylinder motor is 30.50 cubic inches. The valves are mechanically operated on all models, the 1913 motor being fitted with an improved and materially strengthened intake valve cage and a new valve-operating cam, which permits of an earlier and a longer opening of the exhaust valve, thus providing for more complete scavenging of the burned gases.

How More Power Is Gained.

These changes in the timing and the valve design are responsible for a big increase in the power and speed of the motor. A dynamometer test showed that the twin developed 10 actual horsepower, despite the fact that the piston displacement has not been increased, so that 1913 Excelsiors will be eligible to compete in all regularly sanctioned F. A. M. meets.

A radical innovation is the 1913 clutch control, operated from the left grip. The throttle and valve lift are continued on the right grip, with the spark advance—which need seldom be changed—on the side of the tank. By this arrangement the rider has complete control of the whole machine without taking his hands from the handlebars.

The control, as heretofore, is made up of strong steel rods throughout, thus rendering it absolutely positive and sure. The design of the clutch and its control is such that it can be locked in or out by simply turning the handlebar grip over center in either direction. In addition to having a clutch, which is fitted to all models, a separate idler lever to regulate the belt tension is a feature of all the belt-driven Excelsior machines. The clutch is of the improved Eclipse multiple-disc type, which has been equipped with a new oiling system, a heavier cone and a more effective means of locking.

Bosch Ignition.

Ignition is by means of Bosch high-tension, enclosed, gear-driven magneto, the arrangement of the gear-drive being such that, if necessary, the motor can be disassembled without disturbing the timing except for one simple adjustment, which any novice would be capable of making. All 1913 models will be equipped with the new Schebler carbureter, which has been specially built for the Excelsior machine, and is guaranteed to provide greater economy, speed, power and flexibility than ever before.

Lubrication is by the automatic feed, gravity and splash system, the twin models being fitted with an auxiliary hand-pump inside the tank.

Improved Tanks.

Especially deserving of favorable comment are the 1913 tanks, constructed of heavy copper, with no seams except at the top, and reinforced with a U-shaped baffle plate and a heavy wall separating the gasoline and oil compartments. The laps at the joints are unusually long, and the entire tank construction is remarkably sturdy. The gasoline ca-

capacity is $2\frac{1}{2}$ gallons; oil, one gallon, on the twins; the single tanks are slightly smaller.

The well-known Excelsior adjustable, Kumfort Kusion seatpost, heavier and stronger than that of last year, is standard equipment; the spring, by reason of its being of a lighter gauge, is extremely resilient.

Other Refinements.

The forks are practically unchanged, except for a heavier spring and a safety loop. The fork tube is heavily reinforced, and the mudguards are held in place by double stays. Full shock-absorbing Troxel saddles are fitted. Tires are optional at the choice of the purchaser, either Goodyear, United States, Diamond or Continental studded tread; $2\frac{3}{4}$ -inch rear tires and $2\frac{1}{2}$ -inch front tires on the twins, and $2\frac{1}{2}$ -inch tires both front and rear on the single-cylinder models. A choice may be had of either Musselman or Corbin band brakes. The mudguards are wider and have a liberal clearance.

GRAVES FOUR-TIME WINNER.

LOS ANGELES, Cal.—Both Marty Graves and L. Fleckstein hit a winning streak on Sunday, November 3, at the Los Angeles Stadium. Graves was entered in four of the nine events and captured four firsts. He rode the machine used by Al Ward in previous meets. L. Fleckstein had three firsts and one second to his credit at the finish of the meet. Tommy Moon, the Australian rider, and W. G. Hamilton were to have ridden a match race, but the former had trouble with his English machine and the match was postponed. Hard luck stuck to Humiston throughout the meet. Twice he cracked his front cylinder, and in his third race he blew a tire, but managed to reach the paddock without a spill.

Excelsior 7-10 h. Twin, embodying new clutch control for 1913.

Excelsior 4-5 h. Single for 1913, also showing notable improvements.

EWELL'S THRILLING TRIP INTO MAINE

American Motor Company Official Gives His Machine Severe Test and Enjoys Fine Scenery in Pine-Tree State.

MAINE is the best State in New England for testing out a motorcycle's hill-climbing ability. Every road in the neighborhood of the Penobscot River affords a series of trying grades, closely resembling a scenic railway, the chief difference being that along the Penobscot you get real scenery instead of the imitation. When riding a powerful machine that will climb the almost vertical grades, the motorcyclist experiences a sensation which more level country can never produce. It is indescribable. When swooping down a long incline, and then shooting up the next steep grade, the feeling is something like that derived from riding on an express elevator, only more thrilling. Then when the next summit is reached, you guide the forward wheel between a few ragged rocks, which form the protruding top of a ledge, shut off all power and begin the next descent.

From this point, the next hill looks as if it were perpendicular. If a team or an auto happens to be going up at that instant, it looks as if you were in a balloon, gazing down upon it. In some cases you can actually see the floor of an open buggy.

Some Steep Grades.

One of the longest and steepest hills in the Pine Tree State is Hurd's Brook Hill, located in the town of Bucksport, on the road to Bangor. Even high-powered automobiles have to slip the clutch when taking it on low gear, and horse-drawn vehicles have to chalk the wheels and give the horse several rests on the way up. Another road has been built around this hill, as the grade caused so much trouble for all kinds of vehicles, but I didn't know this, and if I had, I would have tackled the hill just the same. I saw it in time to stop at the top of the preceding summit and inquire for particulars. Farmhands who were hoeing potatoes near the road said it was the

steepest in the State, and that they had never known a motorcycle to climb it.

I put in a fresh supply of oil and coasted down the descent before me. Then I opened the muffler and looked at the speedometer just as I reached the foot. The speed hand indicated 45 miles per hour. After passing through about fifty feet of loose sand which slowed me up a little, the long climb began. The throttle was opened up about two-thirds, and the clutch thrust in hard. The motor began to snort viciously with that sharp double crack peculiar to the M.-M. twin, only more savagely than usual, on account of the new 1913 pistons I was trying out on this trip.

I opened the throttle another twist when I reached the steepest grade, and the machine belched forth the blue exhaust through the

open muffler like a gatling gun, the explosions reverberating in the neighboring mountains. The machine shot ahead like a bullet. Reaching the top, I glanced at the speedometer again, and to my surprise it registered 39 miles per hour. That was enough to convince me that the new pistons and new inlet manifold on the 1913 M.-M. twin have increased the power. Another point: With the muffler closed, that motor just rippled along on the level with hardly a sound.

A Chat With Estabrook.

At Bangor I had the pleasure of meeting the genial Mr. Estabrook, of F. A. M. fame. It is no wonder that this fine organization has tripled its size in the last two years with such a conscientious and brainy worker behind the guns of the membership committee. Returning, I paid more attention to the picturesque scenery and wonders of nature revealed in this northern part of the State, as the good qualities of my motor had been proven on the way up and I discharged all thought of business from my mind.

Secretary Ewell, of American Motor Company, starting on his testing trip into the Maine Hills, where 20% grades are considered fairly level roads. Ewell compares them to natural "roller coasters."

Although never out of view of the mountains the rider found some fairly flat country such as is shown in the picture.

MANY IMPROVEMENTS IN STURDY THOR 4.

**All Three Types Show Refinements, But 4 H. Single Embodies Most Interesting Changes—
Original Design for New Clutch Lever, New Rims for Larger Tires, Improved
Carburetor Control and Wider Exhaust Valves on 5 and 7 H. Models.**

AN inspection of the Thor models for 1913 discloses no radical changes in the 5 h. and 7 h. machines, variations from former types being in the nature of refinements rather than actual departures. In the 4 h. model, however, there are several changes which promise to provide stronger

heavier spoke flanges and cone sleeves, making an absolutely rigid front wheel and also assisting in the strengthening of the front fork. The front wheel has a 7/16-inch knockout axle, giving a solid head at one end and a castellated nut at the other, making it impossible for an accident to occur

known Thor internal undergeared type, which does away with the short chain as embraced in some other machines. One of the exclusive features of the new machines is the two-speed gear and control, fitted in the rear hub. This will be given a detailed description in a later issue.

While not cumbersome, the Thor muffler is unusually effective, and is supplied with a long discharging pipe to the rear. The oil pipes and crankcase breather are, as usual, very large, so that the danger of clogging is overcome. The supply of oil to the mechanical pump in the lower section of the gear case is controlled by a needle-valve. The Thor has always had roller bearings in the connecting-rods and these are continued. Wire and cable controls are used, with a separate control for oil, gas and the exhaust valve lifter. The latter is manipulated by a latch on the right handlebar.

Sturdy Spring Fork.

The 1913 spring seatpost will show no changes, the rocker-arm style having given such satisfaction that it is retained intact. This vital feature has undergone the most severe tests during the past season, with perfect results. Greater clearance is afforded between the tires, forks and mudguards to permit of the use of large tires and non-skid chains, should the latter be needed. The tires on the 4 h. model will be 2½ inches wide, and on the two other types the tire width will be 2¾ inches. The spring fork, as before stated, is exclusively a Thor product. Strong double-plunger and recoil springs are located in the main barrels of the truss fork, and it is here that the force of the shock is received and absorbed. The springs are entirely hidden from view, so that the forward section of the frame is given an unusually compact appearance.

The prices for the 1913 Thor models will be as follows: 4 h. single, white or blue finish, \$225; 5 h. single, \$240; 7 h. twin, \$290. The two-speed gear is an extra, and will be fitted for an additional charge of \$40.

Improved Thor 4 h. Single for 1913.

construction and increased ease of action. One point worthy of special attention is that almost the entire Thor machine is made at the Aurora factory. Modern appliances are in use for turning out the most intricate and efficient mechanism for the equipping of the three types, and in this way the Thor designers and mechanics have the machines under their personal supervision until they are ready for shipping. The carburetor, clutch and brake are all produced in the big Thor plant, as is the new spring fork which is introduced this year by Designer Ottoway.

Three 1913 Types.

For the season of 1913 the Thor company will offer three models, under the following headings: "13-M," of 4 h.; "13-W," of 5 h., and "13-U," of 7 h. Magneto ignition is standard on these machines. One of the improvements noted concerns the mechanical inlet valves, an outside spring and extra heavy rocker-arm being incorporated to reduce wear and breakage to the minimum at this point. Other refinements affect the carburetor, a butterfly valve and twin adjustment for air being resorted to by way of facilitating the mixing operation on the 1913 machines.

Some of the Improvements.

The Thor clutch has been strengthened by the clutch body being a solid, one-piece internal gear and hub, made from high-grade drop forgings, carefully treated and hardened. There is an entirely new design of front hub in which 5/16-inch balls are used; it has a surface contact on the ball races, and thus gives longer life to both races and balls. The hub also incorporates

through the loosening of the nut. The rims are heavy and are suitable for either 2½ or 2¾-inch tires. The stand has been changed somewhat, and is now so constructed that it will bear the heaviest usage without damage to the clips. The exhaust tube has been enlarged, thus helping to eliminate overheating trouble, owing to the fact that a more open passage is afforded for the emission of the exhaust gases.

Cylinder Changes.

Model 13-W, with 5 horsepower, embodies all the above improvements in addition to changes in the cylinder; larger radiating flanges are now afforded, and the compression space is increased so that overheating is still further guarded against. All models will have chain transmission of the well-

Sturdy 7 h. Thor Twin.

The SUCCESSFUL DELIVERY VAN

ITS CONSTRUCTION AND OPERATION

by D. R. HOBART

Simple and Effective Book-Keeping Methods—Handling the Driver Problem — Value of Systematic Advertising.

ONE important question in a motor delivery business has never received a definite answer. This is, when should an old car be replaced by a new one? It is easy to say, "when the car has reached the end of its usefulness," but that stage of its existence can generally only be determined by the failure of the machine to perform its work at all. One method which the writer has found of great value, and which has resulted in economy, is the "personal" record of each car, kept from the time that the car is put into service. This record is a matter of simple book-keeping; each car "opens an account" with the company, and is credited with its earnings and debited with its purchase price, interest on the money invested in it, its repairs and tire mileage, etc. Periodical examination—say, every month—of the debit side will show when the car needs an overhaul by its makers, but if the price of such an overhaul exceeds 50 per cent. of the cost of the car per year, it is probably better to dispose of it and purchase a new one. On this matter, the company is dependent in a good measure on its repairman, and it is to the firm's interest to get, and keep, an employee in that capacity whose integrity is proof against salesmen's offers of "rake-offs." A careless or dishonest repairman can put a crimp into a delivery business more effectually than anyone but an absconding cashier. He takes somewhat longer, but results are just as certain.

Simple Book-Keeping.

The accounting of a delivery firm should be the simplest possible. In recent years there have sprung up business systems, which claim to develop proper book-keeping, card-indexing and like systems for any business. Some of these are applicable to all mercantile enterprises; most of them are useless for manufacturing or delivery purposes and valuable only to their perpetrators as money-getters. They are designed by men who are ignorant of the special conditions existing in enterprises dealing with motor vehicles, and are a waste of time and money to install or even consider. The ordinary methods of book-keeping will suffice, special conditions being capable of being handled by any good book-keeper. If a special system is necessary, there are firms who can meet the need, being specialists in garage and like accounting systems. Avoid the business-system as you would any other useless outlay.

Every business has its leaks, some of which can be stopped. In a motor delivery system, outside of the careless repairman, the next most important source of loss will be poor driving. Carelessness on the part of a driver may result in a smash-up involving damage suits by third parties, not to mention the loss from damaged cargo. A driver that has his car too regularly in the shop should be replaced by another as soon as possible. Faked damage suits are a means of livelihood of certain characters (and certain lawyers) in large cities, and it is occasionally better to compromise rather than fight them in the courts. Usually, a vigorous fight will settle such demands once and for all, and in the hands of an insurance company such faked suits die away rapidly. The writer has known of one concern which got into financial straits through a faked suit and was obliged to reorganize to obtain funds to fight it, which they did successfully. Hence, to have all the cars insured is a double safeguard, as fakers are loath to bring suit when an insurance company is involved.

The Driver Problem.

Youths trained to drive a particular make of car and recruited from the ranks of department-store delivery boys usually make good drivers for our purposes. They are more or less familiar with delivery work, also, and are valuable in that direction. It is obviously impossible to lay down any hard-and-fast rule as to recruiting drivers, as conditions vary in different localities. The chauffeur should be avoided, as he is usually of bad habits when applying for motorcycle or tricar driving, but possible exceptions may be made for drivers of department-store cars. At any rate, the manager of the delivery system must expect to be nothing short of a training-school for chauffeurs, whether he likes it or not, as his drivers will leave him as soon as they learn driving, seeking a post as chauffeur on some truck or pleasure motor car. This is more evident as the number of drivers employed increases. The remedy, wages as large as those of a chauffeur, is beyond the means of most delivery concerns.

Advertisement.

In organizing a delivery business, dependent upon the business-houses for custom, advertisement plays a very important part. The bodies of the cars should be of distinctive color and should bear the name of the

concern in contrasting, large letters. If possible, the drivers should be uniformed, if only in clean khaki suits. There should be an announcement run regularly in one or more papers that local merchants read, and the stations themselves should have large signs on them. By this is not meant elaborate and costly electrical or other devices, but those of sufficient form and color to attract the possible customer. It is often desirable to have a car painted to suit a regular or contract customer, carrying his name, etc., but the driver should wear the company's uniform and be subject to its discipline. Pages could be written on the unhappy results of having company's cars driven by customer's drivers, but the best advice on the subject is *don't*. Follow the Quaker's advice: "Keep thy business, and thy business will keep thee."

PLEA FOR PRACTICAL WORK.

EDITOR MOTORCYCLE ILLUSTRATED: Your recent editorials on hill-climbing (or the lack of it) and like really useful contests voices the opinions of the serious riders of the motorcycle. Gasoline is going up in price and more of it is being used every day during the riding season by motorcyclists and automobilists, while the various other industries are using internal combustion engines more and more. And under these conditions, the trade papers have been full of what? Speed records by boys on steeply-banked tracks, riding machines with special gearing, cams, valves, etc. Of what value are these to the tourist, the R. F. D. man or the man who rides for business or pleasure? None whatever. As far as the writer can see, they bring money only to the promoters of the tracks, and when an accident occurs there must be parents or relatives who prevent prospective motorcyclists from buying machines, and the pastime thus loses a convert who might be infinitely more valuable than a dozen of the "90-mile-an-hour-champions."

The majority of our endurance contests cannot be compared with the English six-day trials, or even the London-Edinburgh run. The West seems to be the only part of this country where real contests of this nature are held. The East, in this connection, can well be called "effete." The Short Grass Tour is probably the only *real* endurance run for motorcycles held in the United States. But there was apparently no question of economy during this tour. What is wrong?

STANLEY R. SEBERRY.

A. M. C. MODELS SHOW MARKED SIMPLICITY

Number of Parts Has Been Reduced and Special Attention is Given to Interchangeability for 1913—Improved Valve System, New Style Tank and Numerous Refinements.

SIMPLICITY and interchangeability of parts are two of the features of the 1913 A. M. C., the product of the Allied Motors Corporation, Chicago, Ill. A new form of tank and a black, rubberoid finish on the luggage-carrier, and stand handlebars are distinctive features of this product of A. J. Musselman. Two models, a 4 h. single and a 7 h. twin, are announced, the bore of the single model being $3\frac{1}{4}$ and the stroke 3 43/64 inches. The prices are: single model, \$225, with either V-belt or chain drive; twin model, \$250, with chain drive only.

The number of component parts has been reduced, this feature tending toward the simplicity so desirable in any mechanism. The feature of interchangeability is also very desirable, and is most noticeable in the new twin model. The valve system in particular has been improved, the stems be-

ing threaded instead of grooved and slotted, and the valves are now held by a taper-nut joint which is readily adjustable. A single cam operates both valves of the one cylinder, and there is a separate exhaust-valve lifter lever on the handlebar.

All bearings are large, and alloy steel—with vanadium the chief alloying metal—is used in the frame parts as the fork tips, crank-hanger and frame head. The new style tank has two removable and separate compartments for gasoline with an interior compartment for oil. The fuel compartments are hinged together around and over the top tube and brace tube, making for a neat appearance. In a channel in the tank the speedometer tubing is to be run, and two filling apertures are provided. The oil tank occupies the center of the whole tank arrangement. The gasoline capacity is three gallons.

Control is by twisting grips with cable connections, hidden in the handlebars. The fork is of the double-acting rocker type and a rocker type spring seat mast is fitted. The muffler has a spring-locked cut-out and gives direct discharge from the exhaust pipes. Wide mudguards are fitted, and the rear guard is hinged to permit of ready removal of the wheel or tire. The rims are of the new size, and will accommodate 28 x 2½ or 29 x 2¾ inch tires, which are of Continental make as standard. Heitger carbureters, Eclipse clutches and Bosch magnetos are standard equipment on this product, and the latter are mounted in rear of the motor cylinder on an aluminum base. The color scheme will be cream, with black rubberoid on certain parts and nickel on others. The letters "A. M. C." will be placed on the tank sides. On the whole the models create an excellent impression.

OCTOBER STATISTICS.

F. A. M. membership gains for October were as follows: Maine—unaffiliated, 1; Massachusetts—affiliated, 5; unaffiliated, 11; renewals, 11; Rhode Island—renewals, 3; Connecticut—renewals, 2; New York—affiliated, 8; unaffiliated, 5; renewals, 21; New Jersey—affiliated, 4; unaffiliated, 12; renewals, 9; Pennsylvania—affiliated, 25; unaffiliated, 10; renewals, 12; Maryland—affiliated, 2; unaffiliated, 1; renewal, 1; Virginia—unaffiliated, 1; renewal, 1; W. Virginia—affiliated, 1; unaffiliated, 2; S. Carolina—renewal, 1; Tennessee—unaffiliated, 7; renewal, 1; Georgia—unaffiliated, 1; Florida—affiliated, 1; renewal, 1; Alabama—unaffiliated, 4; renewals, 3; Texas—affiliated, 24; unaffiliated, 5; renewals, 2; Kentucky—unaffiliated, 1; renewal, 1; Ohio—affiliated, 52; unaffiliated, 19; renewals, 16; Indiana—affiliated, 28; renewals, 12; Illinois—affiliated, 34; unaffiliated, 3; renewals, 17; Missouri—affiliated, 1; unaffiliated, 1; renewals, 7; Wisconsin—affiliated, 2; unaffiliated, 8; renewals, 5; Michigan—affiliated, 2; renewals, 2; Minnesota—affiliated, 1; South Dakota—affiliated, 4; Kansas—affili-

ated, 36; renewals, 12; Iowa—renewals, 2; California—affiliated, 29; unaffiliated, 5; renewals, 34; Utah—unaffiliated, 1; Colorado—unaffiliated, 5; renewals, 3; Arizona—affiliated, 3; Idaho—affiliated, 1; Oregon—affiliated, 1; Washington—affiliated, 7; renewals, 2; total—affiliated, 271; unaffiliated, 103; renewals, 181.

TWENTY-TWO motorcyclists of Savannah, Ga., all riders of Thor machines, recently made a Sunday run to Wheelmen's Inn. Not an accident occurred during the run. It is expected that a Thor club will be formed in Savannah.

A 25-MILE WINNER.

IN a recent 25-mile race held in Madison, Wis., Henry Pehrson, of Rockford, Ill., took first place. E. Esther, of Madison, won the second prize, while Carl Swenson, of Rockford, finished third.

I. A. CARP, of Milwaukee, Wis., who expects to reach the summit of Mt. Spokane on a motorcycle, is believed to be the first person to attempt the stunt.

NEWARK NOTES.

A POOL table was presented to the New Jersey M. C. at the last meeting by Fred. Cordes, one of the members, with the proviso that it be used every night. It is expected to be a good means of bringing the lagging members out of their shells more often.

Miss Katherine Brunner, of Newark, applied for membership in the club recently, but as there are at present no ladies holding membership in the club, the membership committee elected her an honorary member. Miss Brunner is a Pope rider, and is the only lady solo rider in Newark.

Walter Goerke, one time amateur champion, recently returned from a three-week's hunting trip in the Maine woods. He claims that he could have shot four deer a day, but he didn't see the use of killing them off at that rate. He shot 400 cartridges—or cartridges—he can't remember which.

RUMORS of a board track for Baltimore have again cropped up. This time, it is said, one of the biggest promoters in the country has his eye on this city.

Members of the Excelsior M. C., of Elwood, Ind., Ready for a Recent Road Trip.

Pennsylvanians On New England Jaunt

by
B. F. CONNOR

B. F. CONNOR, of Wilkesbarre, Pa., accompanied by E. B. Wagner, Ted Burneford and Joseph Helfrick, recently made a flying trip through New England by motorcycle, and the experiences of the party are dealt with briefly in the article which appears below. Considerable rain was encountered, but the riders were not bothered by mechanical trouble until a downpour at the close of the trip brought on short circuits. Connor, who is the Indian agent in Wilkesbarre, writes as follows:

Connor.

Once at the top we were anxious to get down again, as the air was very cold and heavy overcoats would have been welcome. We lost no time in getting back to the hotel.

After crossing the ferry to Fishkill the next morning we proceeded to Poughkeepsie, Amenia and Great Barrington; thence over good roads through Lee to Springfield, Mass., climbing Jacob's Ladder with ease. We reached Springfield at 7.15 p. m. and put up at a hotel for the night. The next day we visited the Indian Wigwam; we were shown through the factory and later taken out to lunch by a repre-

sentative of the Hendee company. During the afternoon one of the testers took Helfrick out for a spin and he enjoyed a fine ride. We decided to remain in Springfield a second night, much to the delight of Helfrick and Wagner who congratulated themselves upon the fine room assigned them. However, they were not very well pleased with the bill.

Visit to Shoe Factory.

We spent the following morning in Springfield and left for Boston about noon. We found good roads through Worcester to Boston, arriving at the latter city in good time. We proceeded to the store of G. N. Holden, Indian agent, where we left our machines. That evening we enjoyed a good show at Keith's theatre, and the next morning found us spinning along the road to Brockton. Here we visited the Walk-Over shoe factory, as Burneford of our party was

Helfrick.

interested in that line. We received excellent treatment, one of the office staff showing us through the factory. After dinner we lined up in front of the factory building and had our pictures taken.

Shortly after this last performance we were again on our way, reaching Providence without incident. We did not remain in Providence but continued down the coast to Narragansett Pier. One finds this part of the country rich in scenery, and motorcycle traveling is ideal. We spent the night at the pier and it was unanimously agreed to visit the barber. On Sunday morning we rode on to New London, arriving there about noon. Then we were delayed a couple of hours on account of rain. It cleared off about the middle of the afternoon and we again took to the road, which was none too good when we reached Clinton Horn. After leaving this point we paid 15 cents each for crossing the Saybrook bridge which spans the Connecticut River. We then continued on to Clinton, where we had the pleasure of staying for two days, a heavy rain which continued during that period making it impossible to ride.

On the Home Stretch.

On Monday night we rode 25 miles to New Haven, where we purchased some chains for our tires from the Indian agent; we returned to Clinton the same night. Tuesday morning we set out again and found the roads to New Haven very muddy.

At the Walk-Over Shoe Factory, Brockton, Mass.

Burneford.

A heavy thunder storm came on and there being no shelter worthy of the name nearby we all got drenched. We had stopped at the roadside and when trying to start found our magnetos all short-circuited. Helfrick and Burneford were unable to dry out their magnetos and were forced to leave their machines in the woods all night and walk six miles to Beacon Creek, where they spent the night in a small hotel. The writer, after considerable trouble, got his machine in motion and rode on. The next morning we were busy making repairs as best we could and finally we got under way. With pennants which we had collected along the route flying from our machines and bright weather once more we reached Wilkesbarre in good time and agreed in saying that we were glad to get home.

AN INTERESTING STATEMENT.

WILLIAM HETHERINGTON, JR., a Brooklyn motorcyclist, makes the following interesting statement of his operating expenses on a twin seven for 1912 to September 30. His total outlay for gasoline while covering 5,000 miles was \$15.40, and the oil used during the same period cost \$3.40; this gave a total of \$18.80 for fuel and oil for 5,000 miles, or an average of .00376 per mile. Repairs for the period mentioned footed up to \$5.10 so that the total expenditure was \$23.90. The rider figures that it would have cost him \$100 to cover the same territory by train, and that the saving in favor of the motorcycle is therefore \$76.10.

CALIFORNIA TOUR.

W. H. VAN SLYKE and **T. W. Clark**, of Eureka, Cal., recently completed an extensive trip through California, visiting Los Angeles, San Bernardino, Redlands, San Joaquin, Bakersfield, Fresno, Santa Rosa and a number of other smaller towns.

A GOOD ROADS ADVOCATE.

MOTORCYCLISTS of New York State will be interested in the announcement that Governor-elect William Sulzer is a Good Roads enthusiast. Not long ago he spoke at length in behalf of road improvements in the New York House of Representatives.

TRENTON'S ACTIVE CLUB.

THE Indian M. C., Trenton, N. J., is one of the liveliest organizations of its kind in the state. Regular runs are held to the shore or through the mountains every two weeks, and small parties of the members frequently make informal jaunts.

Not long ago one of the club members was run down and injured and the squad quickly raised \$75 to assist him in meeting bills for medical services and for other matters incident to the accident. This spirit has created an excellent impression among the townspeople, and as a result motorcyclists are now receiving more favorable consideration in Trenton than ever before. **R. C. Crist**, former president of the club, recently underwent an operation for appendicitis.

COLUMBUS M. C. OFFICERS.

COLUMBUS, Ohio.—At a recent meeting of the Columbus (Ohio) M. C. officers for the coming year were elected as follows: **Roy Knight**, president; **Henry Deeever**, vice president; **W. H. Ferguson**, recording secretary and **George H. Bangham**, financial secretary and treasurer.

The reports for the year showed the club to be in good condition. Since the colder weather set in more interest is being taken in club affairs. The motorcyclists of Columbus have been notified to provide themselves with front and rear lights after November 29 when the new motor ordinance becomes effective.

SALT LAKE OUTING.

ABOUT forty members of the Salt Lake City M. C. recently made a Sunday run to Provo and return. Much interest is shown in the newly organized club and already the members have enjoyed a number of social runs.

A FRISCO MOTOR-COP.

JOSEPH HOLLE, Harley-Davidson agent in San Francisco, forwards the accompanying photo of motorcycle officer **Robert E. Lindsey**. Lindsey rides one of the Six Harley-Davidsons made especially for the police department of San Francisco.

CHALK UP TWO MORE.

SECRETARY GIBSON reports the Corner M. C., of Rawlins and Cheyenne counties, Kan., and the Peekskill M. C., of Peekskill, N. Y., as affiliating with the F. A. M. during the week ending November 2.

FOUND POOR ROADS.

MEMBERS of the Waco (Tex.) M. C. recently participated in a run to Dallas and found bad roads to such an extent as to make the trip a disagreeable one. The roads were particularly poor beyond Italy.

UP to the present time 253 motorcycle tags have been issued for 1912 in Lima, Ohio. This is more than twice the number for last year.

A READING PACEMAKER.

MRS. W. G. SCHAEFFER, who appears in the small panel at the left and in the center picture, is the wife of the genial proprietor of the Penn Cycle & Motor Co., of Reading, Pa., and a motorcyclist whose road record is a remarkable one. She accompanies the Reading M. C. on all its runs, having been made an honorary mem-

ber, and has shown the rear tire of her Reading-Standard single to more than one of the boys. Not long ago Mrs. Schaeffer accompanied her husband on a trip from Reading to Bridgeport, Conn., on which 290 miles were covered on two consecutive days, the actual riding time being 12½ hours. Mrs. Schaeffer piloted her own machine and was always up with the schedule.

NORWICH M. C. DINES.

C. V. PENDLETON, JR., 10 Broadway, Norwich, Conn., a dealer in motorcycles and sporting goods, forwards the accompanying photograph of the Norwich M. C. members who participated in the recent banquet. An excellent menu

was supplemented by a high-class entertainment program. The present officers of the club are: C. C. Simpson, president; William Bode, vice-president; C. V. Pendleton, Jr., secretary-treasurer; H. F. Burdick, captain, and Peter Desjardins, lieutenant. The banquet was held at the Auditorium Hotel in Norwich on October 26.

PECK CLEANS THE BOARD.

LOS ANGELES, November 11.—A hard rain today again kept the attendance down at the Stadium. Ray Peck carried off the honors, winning every event in which he was entered. In the second race Humiston had a slight lead, but was disqualified for fouling Whittler, thus giving Peck, who was in second place, another first to his credit. The contests for unported machines were as close as the faster races, Rognon in each case sliding ahead at the very finish.

OHIO'S HIGHWAYS.

COLUMBUS, Ohio.—The Ohio State Highway Commission has completed a huge road map of the Buckeye State, 10 feet square, which shows every road within the limits of the state. The map is the work of the commission, assisted by all the county engineers in the 88 counties of the state. It shows the system of inter-county highways as devised by the commissioner and urged upon the Legislature, and indicates that there are about 89,000 miles of highways in the state.

OTTO PRIEDE, well known to all motorcyclists in Detroit, Mich., is making an extensive trip throughout the United States on his motorcycle. His route is from his home to Kentucky and Florida and along the southern route to San Francisco.

Homer C. Garner, New Head of Harley-Davidson Export Department.

CHICAGO M. C. STAFF.

AT the annual election of the Chicago Motorcycle Club, held in connection with a grand ball and entertainment, the following officers were elected: R. T. Purdy, president; F. E. Yates, vice-president; Donald Hull, secretary, and A. Willen, treasurer. William S. Covington was named road captain, with E. Schaddie and Frank Nelson as his lieutenants.

BALTIMORE BREVITIES.

BALTIMORE, Md.—The rough riders of the Maryland M. C. had their inning on Sunday, November 10, on a run to Havre de Grace. This was the first trip over the Harford pike this season, and some of the hard going was eliminated by taking the route through Loch Raven. On Sunday, November 3, the members of the club tried out the new boulevard to Annapolis, which has just been thrown open. This is one of the finest stretches of road in the state and the fine weather on that day brought out a large attendance, there being a number of fair tandem riders to keep the boys in check. The fight for the diamond studded attendance medal is still being fiercely waged, with Nelson Johnson holding the lead.

FOR SPARK PLUGS.

TOURISTS on long trips who wish to carry one or two spare spark plugs may utilize a leather cigarette case, or even a small leather cigar case. If two plugs are to be carried a piece of stiff leather or a small block of wood should be placed between the plugs to avoid damage through having them strike or grind together.

PECK SIGNS NEW CONTRACT.

RAY PECK, of Los Angeles, well known to Eastern riders through his remarkable riding at the Newark Motordrome during the past season, will hereafter ride tandem. Ray signed a life contract on November 14 with Miss Bessie Fyan, also of Los Angeles. Although Ray is not competing on the tracks just now he fully expects to come East next summer and ride on the Eastern bowls.

NEW WANDERSEE QUARTERS.

DETROIT, Mich., November 11.—Detroit is to have one of the finest motorcycle and sporting goods houses in the Middle West, William E. Wandersee having already started work remodelling his building into a plant that will be a model of its kind. During the alterations the Wandersee store has been moved from the old location, at 129 Gratiot, to 227 Gratiot. Mr. Wandersee proposes to spend \$30,000 on the repairs.

OVER 500 motorcycles were sold in Baltimore during this year, one dealer alone disposing of half this number. The demand for second-hand machines has been greater than the trade could supply.

A MEETING was held in London, Eng., recently for the purpose of forming a motorcyclists' association, restricted to riders of both sexes who come within the official definition of an amateur.

From Reading to the Ohio Line

GEO. K. SNYDER

FOLLOWING is an unusually interesting story of a tandem trip from Reading, Pa., to Wheeling, W. Va., written by George K. Snyder who piloted his Harley-Davidson machine over the long route successfully with George P. Eger as his passenger. The fact that the machine carried double throughout the journey naturally adds to the interest aroused in the performance. Snyder's narrative is as follows:

In addition to carrying my regular tool kit I filled an extra supply bag which I strapped to the saddle. It contained a 12-inch wrench, two spark plugs, one control wire, half a dozen patches and a can of cement; one pair of belt clamps, a can of belt dressing, some straps, tire tape and a blowout shoe. A camera was held by a heavy strap running across the handlebars and fastened just back of the grips. Carried in this manner it was protected from all jars and bumps and was not likely to be damaged in a fall. With this general equipment I was ready for the road.

It was originally understood that six riders were to make the trip, but when the day arrived to start four of the prospective tourists showed unmistakable symptoms of "cold feet," and Eger and myself were left to undertake the trip alone. We started at 3 o'clock in the afternoon and made good time to Wernersville, where we were compelled to seek shelter from a heavy thunder shower. Later we headed for Harrisburg over a fine pike road. We were not bothered except at the toll gates, which were only a few miles apart, and it was some consolation to know that these will soon be done away with, as the State has taken possession of the pike between Reading and Harrisburg.

An Unusual Accident.

We were just rounding a hill beyond Hershey's Park when with a cannon-like report a blow-out informed me that my rear tire had suffered. After repairing the inner tube as well as possible, we attached the blowout shoe, and in half an hour were again spinning along. We had not ridden two miles when the rear tire was again going down, so after working our way to within a few miles of Hummelstown, by occasionally exercising the pump, we decided that my companion should take the trolley to Harrisburg. I figured that I would reach the capital city more easily with reduced weight on the rear tire. A short distance further on, where the main line of the P. & R. Railroad crosses the pike, my blow-out shoe caught in the rails, and I was thrown 10 feet into the air, landing on my head and hands. The machine landed against a tree.

I found part of the shoe wedged between the tracks and shredded to pieces. This was the most peculiar motorcycle accident I had ever heard of, but I was thankful that I escaped with a skinned knee and a bruised hand.

After bending things into shape again and getting some tire tape into service I was ready to start, but found that the front rim was bent almost beyond repair. I was certainly in an awkward position, alone with disabled machine and unable to fix it. I tramped across the hills in search of a farmhouse and was fortunate in finding one less than half a mile distant. I had some trouble in convincing the farmer that he should take me to town, which was only accomplished by making him a generous offer. He rigged up a team finally, and we were off for the machine, which we had trouble in getting into the wagon. We arrived at Harrisburg at 9 p. m., the last hour having been made in a heavy rain. That part of the trip I will never forget. I placed the machine in a garage and started to hunt for George. He had arrived by trolley about three hours ahead of me. I found him at the Hershey House.

On the Trail Once More.

After breakfast the next morning we went to the garage and loaded the machine into an express wagon and started for the Harley agency. Heagy Brothers, the proprietors, gave us the best of attention, and at 9:30 a. m. the

repairs were completed, including the placing of a new Goodyear tire on the rear wheel.

We left Harrisburg at 10 o'clock, and were escorted as far as the Harrisburg Bridge by one of the Heagy boys. We had macadam roads to Mechanicsburg and good dirt roads from there to Carlisle. Here we visited the Indian college and a few other interesting points. We ate lunch before leaving for Shippensburg. On leaving Newville we took the wrong road, which led to Doublin Springs, and thereby encountered nine miles of rough mountain road. We discovered our mistake finally and went back to Newville; there we got on the right road to Shippensburg.

We had a fine State road, a 22-mile stretch, from Shippensburg to Chambersburg, and spent some time in the latter place viewing the town. At 3 o'clock we started for McConnellsburg. We found good roads until we reached the foot of the Tuscarora Mountains, which are 2,400 feet above sea level. There is a $4\frac{1}{2}$ mile grade on the east side and one of $3\frac{1}{2}$ miles on the west. It was with much difficulty that we managed to get up, as the grades are very rocky and sandy. The western slope was in better condition, however, and coasting can be enjoyed to a certain extent. We reached McConnellsburg at the foot of the mountain at 7:30 p. m., and stopped at the Fulton House. We had traveled 134 miles that day.

More Mountains to Climb.

We started rather late on Sunday morning. A mile from McConnellsburg we had more mountains to contend with, which were almost as bad as the first. There were three ranges joining each other, 22 miles from the first to the last. Here riding was unpleasant, and in some places the sand seemed to be bottomless. These hills, unlike some others, have no level stretches, but necessitate a continuous climb from base to summit. At Bedford we ate lunch and had a short rest. From Bedford to Greensburg the road conditions were good, most of the road being new. Then for 10 miles we had unfinished roads, making rough riding, but even this was better than the mountains. Approaching the Allegheny Mountains we were encouraged to find that the mountain was climbed by a fine State road. Here riding was a pleasure and the scenery very fine. We reached Greensburg at 6:15, but did not care to spend the night there, so started for Jeanette, five miles distant. We had good State roads between these places. We found Jeanette to be a fine little town and received the best of accommodations at the Miller House. From Greensburg to Jeanette may be seen soft coal

Snyder and Eger Just Before Leaving Reading on Their Cross-State Jaunt.

mines, oil and natural gas wells, all within a distance of half a mile.

On Monday morning, while making a few minor repairs, we met an old glass worker, who offered to show us through one of the largest glass mills. This was quite fortunate, as strangers are not usually admitted for sightseeing. This was the most interesting experience we have ever had.

When Eger Was Dropped.

At 10 o'clock we started for McKeesport, a distance of 30 miles, and found fine roads leading out of town. The following is an instance where the joke was on George: While descending a steep hill I struck a gutter, or water breaker, as the Westerner would call it, and somehow it threw friend George off his seat. I did not notice his absence, and about four miles further on I was surprised to find him missing. I went back and found him sitting on a fence enjoying the laugh with me. With the exception of a skinned shin he was O. K. He mounted once more and we were on our way. We arrived at McKeesport at 1:30, and spent the rest of the afternoon in sightseeing. At this point the tourist will find the National Tube Works of interest, they being the largest of their kind. The macadam roads make riding very agreeable on the winding boulevard over the hills, and here the scenery is excellent.

On Tuesday morning we rode to Pittsburgh, a distance of 18 miles, over State roads. Within the city limits there is nothing but macadam and asphalt pavements. Here is where the motorist must watch his speedometer, 24 miles being the speed limit in the outlying districts and 12 in the city. There are motorcycle cops to follow you as soon as you get to the city limits, but they are reasonable and tell you the regulations. Highland, Schenley and East Liberty Parks will be found fine for riding and of great advantage, as most of the points of interest can be seen from these elevations: Carnegie Technical Memorial Hall, Public Library, Carnegie Roof Garden and the wharf on the Ohio River. Looking over East Pittsburgh the rider can see the famous Westinghouse Motor and Electric Co.'s plant covering five city blocks.

Over the Old National Road.

On Wednesday morning we were rolling along the old National Road headed for Wheeling, via Little Washington. The road conditions were fair. For the entire distance of 58 miles the rider will find himself in the oil and natural gas district. We passed many old and new derricks, also quite a few soft coal mines. Our time being limited, we could not spend much time in sightseeing. We had to reach the Ohio river by 7 o'clock, as the boat which was to carry us back to Pittsburgh runs only every two days, and we could not afford to miss one. Approaching Ohio the roads are generally poor, with very few good stretches. Sand is plentiful.

After having breakfast and overhauling our machines on the following morning we were ready to land from the boat at Pittsburgh and our homeward trip was started. We made directly for Chambersburg, where we arrived Friday morning. We reached that point in good condition, but had two sand spills. From Chambersburg we traveled southward for Gettysburg, the battlefield being our objective point. We found dirt roads. York was our stop for the night, and we arrived home in Reading at 2:15 p. m. on Saturday wet to the skin, for we had been caught in a thunderstorm a short distance out on the road.

We had fairly good weather throughout the tour, and the trip itself can be recommended to any rider wishing an outing in this district. However, at least two weeks should be devoted to it, as we were cramped for time.

Our trip was covered from noon on August 2 to noon on August 10, and the distance was 1,160 miles. We had no engine trouble, one blowout and no punctures nor breakage of any kind. The gasoline consumption averaged a gallon to 89.3 miles, and the total consumption was 13 gallons. We used a 6½ h. p. belt-drive Harley-Davidson.

S. Platten, of Toronto, and Family, with Rudge-Whitworth Machine and Sidecar.

PICKING SIGNPOST COLORS.

TESTS have been conducted in England recently to determine the colors which render signposts visible at the greatest distances, and which are most easily distinguishable in foggy weather and at night. At various points several posts, having different color combinations, are set up and motorists are called upon to assist the authorities by stating which colors appear to be most satisfactory.

A STUDENT, living 18 miles from the Larned (Kan.) high school which he attends, makes the trip to and from school every day on a motorcycle.

A PORTLAND PARTY.

ANDREWS & GAERTNER, M. M. and Eagle agents in Portland, Ore., forward the accompanying photograph of a party of Portland riders. From left to right they are Miss G. M. Slavens, Axel Kildahl, Mrs. Iva

SOME TRACK WINNINGS.

THERE has always been considerable curiosity relative to the incomes of board-track racers, and for this reason a few figures—gathered recently at the Dallas bowl—should prove interesting. They indicate that the conscientious rider need never worry about the price of his next pair of riding breeches, as long as he can find a track open for business. From October 13-27, for example, Harmer pulled down \$185 for his work on the Dallas saucer; Richards earned \$195 during the same period and Trafsky managed to tuck \$315 into his wallet. On the other hand, Swartz earned only \$50 for two weeks, thus establishing the low-water mark for the period. From October 15-27 Jim Cox raked in \$125, Ed Bowen received \$115, and Bruggeman earned \$95. Through his winnings in the events staged between October 20 and October 27 Mike Cafarello increased his bank account by \$130.

PATHFINDERS WANTED.

W. S. BRISSEL, chief clerk of the Touring Department of the Automobile Club of America, announces that his organization is preparing to gather road and hotel information over a wide area, and he is of the opinion that this may be done most advantageously through the use of motorcycles. Accordingly he is desirous of getting in touch with riders who are willing to take up the work for a salary and with their expenses paid. It is taken for granted that no previous experience is necessary, and motorcyclists who may be interested in the proposition should communicate with Chief Clerk Brissel at once. Letters may be forwarded in care of the "Bureau of Tours, The Automobile Club of America, 54th and 55th streets, New York City."

HARRY E. PATTERSON, of Pittsburgh, Pa., is making a trip to Whittier, Cal., on his motorcycle. He was last heard from in Globe, Ariz., at which time his speedometer registered 4,700 miles.

Boyer, S. T. Boyer, Miss M. Traynor, R. W. Potter and Miss Millie Feichtenger. The picture was taken by R. A. Gaertner. The presence of the ladies in the party indicates that the social possibilities of the motor two-wheeler are at last being appreciated in the great Northwest.

THERE is a saying to the effect that Dame Fortune smiles upon the favored few, and while this is not intended to apply to motorcyclists exclusively it cannot be denied that the owner of a single-tracker often has it brought to his notice with particular force. One rider may go through a season—or several seasons—with little or no trouble, while another finds something to worry him at every turn of the road; I am not a trouble-seeker by nature, but I must admit I have been enrolled in the latter class of late. In other words I have had a "jinx," and a mighty active one.

When my old "juggernaut" was traded in for the very latest and finest product of the Wigwam early last Spring, I heaved a sigh of relief, for I took it for granted that I had seen the last of my jinx for a season at least. Without reflecting on the machine in the least, I must say I was wrong; on my first trip I ran into trouble with a capital T. It happened this way: I was about to pass a green rider on the road, and this individual—possibly because he was chagrined at being passed—swerved over to my side of the highway and a glorious mix-up followed. We were both well within the speed limit when the crash came and so escaped personal injuries, but both the machines suffered.

The Demise of a Pesky Pup.

After making a few pertinent remarks I looked over my mount, straightened the pedals, handlebars and front fork and patched a hole that had been punched in the tank; then I was able to make headway, after a fashion. Later in the day another minor spill deprived me of the use of the control lever regulating my spark, and as a result the journey homeward was accomplished at the rate of 35 miles per. I could not maintain a lower speed. When I reached home the damaged machine went into a repair shop and in a few days I was able to use it again. Then I became aware of the presence of the jinx once more.

I was rolling along a suburban road, at peace with the world, when a dog ran out and persisted in snapping at my ankles; I wear canvas leggings and did not relish the idea of having this pup get his teeth in action. Finally through jockeying all over the road for a quarter of a mile or so I managed to

get the dog in front of my machine, and I was not slow to give him his finish. I went down of course, and nursed skinned knees and elbows for a week afterward, but I was consoled by the knowledge that I had given that dog a record-breaking bump.

An Affair With a Spike.

On my next trip I managed to run a huge spike—it looked like one of the railroad variety—through my rear tire, but as I had a cement tube, presumably full, some patches and a supply of patience I went at the repair cheerfully. When I attempted to apply the cement, however, I discovered that the tube was empty. Then I sat down to wait for the appearance of a brother rider from whom I could borrow some. I had just about decided that my jinx had double-crossed me altogether, when I heard the purr of a motorcycle in the distance and a rider came into view. He gave me cement and sympathy and I went on.

Strange to say, from the day of this first puncture until early Fall I did not break into another tire. During the F. A. M. National Tour, while other riders were dropping by the wayside with punctures and divers other troubles, I kept to the trail and exulted over the steady chug-chug of my motor. In fact, for more than 6,000 miles I did not have any trouble. On the first day of the F. A. M. run to Columbus I had the misfortune to lose my tool-kit, but I did not need it throughout the trip.

Finally I became so accustomed to perfect

William Hetherington, Jr.

behavior on the part of my machine that I neglected to give it even ordinary attention, and in a short time my jinx was back on the job. In my last two trips I have had four accidents. On the first of these outings an-

other dog met an untimely end, and on the latter run I figured in a minor spill and severely burned my hand on the exhaust pipe. It is with regret that I acknowledged my failure to turn about and return home when I received the burn, for had I acted upon this advice—given by a friendly motorist who happened to pass—I would not have been called upon to put up with the experience that followed.

On continuing the trip I had proceeded not more than half a mile when a wire hoop, embedded in the dust, sprang up as my front wheel struck it and became entangled with the wheel and fork. The spill was a nasty one, resulting in my making a hurried acquaintance with a doctor. After the "Doc" had patched me up I managed to get back into the saddle, and was inclined to believe that my troubles were over for the day. Once more I was mistaken.

I was riding along at a comparatively slow pace and trying to quiet my nerves, that had been jarred a bit in the hoop mix-up, when

an eccentric automobile driver spun around a turn and bore down upon me on the wrong side of the road. I saw trouble coming but could not dodge it. After I was disentangled from the wreckage I found that I had sustained no new injuries, but a single glance told me that my machine was just about fit for the scrap heap. I was sore—mentally and physically—so you can imagine my surprise and indignation when a minion of the law appeared and placed me under arrest. Yes, sir, that copper arrested *me*! Just think it over. After all I had gone through this last blow was a crusher.

It appears that a policeman always acts upon the presumption that a motorcyclist who figures in an accident of any kind is bound to be in the wrong; at least, that has been my experience with the coppers. Well, to get back to the mix-up, I was ready to call upon the Legal Action Department of the F. A. M., when the judge decided to listen to my side of the story, and of course I was discharged. I have wondered since why my jinx did not stick around and have me fined or sent to jail. Such action would not have greatly surprised me. At considerable expense I managed to get the remains of my machine back home and it is once more undergoing general repairs.

OFFICIALS in charge of the New York and Chicago Shows may profit by a suggestion—now being taken up in London—that attendants and other representatives of the exhibitors be called upon to wear a distinctive badge or button, so that the visitor's problem of getting in touch with some one in authority may be simplified. It may be argued that most exhibiting firms are so well represented that a visitor cannot approach a stand without encountering a company representative, but the fact remains that a seeker for information often addresses several disinterested bystanders before being finally directed to the attendant whose duty it is to receive visitors and answer questions. That the show attendants do everything now within the range of human effort to enlighten spectators is undeniable, but the button or badge system would still further increase their usefulness during the big shows.

SEVERAL companies have in the past supplied their representatives with novelties to be fastened to the lapel of the coat, or even worn on the hat, but these soon won such popularity that they had little or no value as distinguishing marks. Before the show was two hours old they were to be seen on all sides. What is needed is an official symbol, the wearing of which will be confined to attendants and firm representatives. Every query addressed to an attendant at a motorcycle exhibit breaks the ice for business, and for that reason—if not from purely humanitarian motives—the process of interrogation should be shorn of all obstacles. The idea is at least worthy of serious consideration by the show potentates.

FROM a motorcycle traveler—now covering Southern territory for one of the most successful manufacturing companies—comes a letter embodying an idea (the capital is used advisedly) that should strike home to open-eyed dealers and others in the motorcycle field. This traveler has discovered that the motor two-wheeler is growing in popularity more rapidly than facilities are being developed for handling it in the Southern states, and that prospective riders by the score are merely waiting to be introduced to their mounts. In other words, there is a scarcity

of active dealers throughout the South. The traveler calls attention to the all-year riding opportunities in this territory, and states that some motorcycle companies are willing to pay \$25 a week for experienced motorcycle mechanics.

THERE is probably more to these remarks than is gleaned at first thought, and the Northern dealer whose eyes are turned toward more productive territory will do well to give the situation serious thought. That there is a remarkable demand for motorcycles in the South—and that the outlook for the future is excellent—cannot be denied; these conditions coupled with the announcement that dealers and repairmen are at a premium there should suggest prompt action to the seeker for motorcycle business in a new field.

A RECENT decision of the Motor and Accessory Manufacturers' Association, relative to the show exhibits of its members, will be of special interest to those firms producing both automobile and motorcycle fittings. A question was raised as to whether members of the association should be permitted to exhibit in the independent motorcycle show to be held in Chicago, and it has been officially decided that manufacturers who cater to both fields may display their motorcycle products at the coming show without affecting their status in the M. A. M. A. A number of large companies hesitated to take space in the motorcycle show because of an understanding that such action would conflict with the regulations of their association.

"EIGHTEEN THOUSAND square feet of floor space set aside for the Chicago Motorcycle Show, and every foot of it already applied for," reads a bulletin from the Western metropolis. And only a few months back there appeared to be a question as to the ability of the motorcycle trade to handle an independent exhibition!

DEVELOPMENTS have been rapid in the Windy City, and as usual the early bird came into his own. However, we can't all be early birds, and Manager J. S. Vogel still has something interesting to say to prospective exhibitors. Better write now. Vogel

is the man, Chicago the place, and today is the time.

WHILE exonerating the management of the Vailsburg Motordrome from criminal responsibility for the Hasha-Albright accident of September 9, the Essex County (N. J.) Grand Jury recommended in its recent presentment that immediate action be taken by the authorities to prohibit further motorcycle racing, thereby paving the way for regulations that may leave the promoters with a useless board track on their hands. It is far from the intention of the writer to argue that human life should ever be held as cheaply as financial interests—or that purely mercenary concessions should outweigh the dictates of reasonable judgment—but it would seem that the recommendation of the Newark solons is unduly harsh. The Vailsburg accident was one to bring any official body up with a sharp turn, but that it justifies a prohibitive racing edict may be questioned.

HOWEVER this point may be disposed of it cannot be denied that there is food for thought in the Newark jury's presentment, particularly in the statement that board saucer racing is "fraught with such reckless exposure to the lives of the competing riders as to render it closely verging on criminality." This argument will bear modification, of course, but the fact that it has been unqualifiedly embraced in such a document should move promoters and riders to greater caution for the 1913 season. It should be the aim of track managers to prove that motorcycle contests on board saucers are not "verging on criminality," and to this end reasonable restrictions must be placed upon racers and advantage must be taken of every structural safeguard in track building.

ARE we coming to the all-black motorcycle? English designers appear to think so, and their leaning in this direction is evidenced by a 1913 crop of black fittings and accessories that formerly sported nickelplating. Britishers have gone so far as to turn out machines with hardly a spot of nickelplating in view, but as yet the demand for these mounts is restricted. Several English firms are now producing all-black handlebars, horns, lamps and generators and riders appear to favor them.

DAYTON NEW YORK TRAIL

BY WAY of introduction, I should state that it was on one of those frigid nights last winter that the Flying Merkel squad met at the home of one of its hospitable members to participate in a chuggers' buzz 'bee. Weird tales were expounded relating to unattainable speed and blood-curdling adventures that were supposed to have been the crowning feats of the riders for the season that had just closed. The steel bronchos had been relegated to

their cold-season pasture, and the most interesting dope the motorists could thresh out concerned the prospects for the next summer. Finally the boys agreed on that night that they would feature the summer by making a trip from the Gem City of the West to Boston, and later to the home of the Giants and the Great White Way.

Having always been more or less of a boulevard rider, I decided it would be wise to get in condition for this proposed trip. So about the time the blue birds were aeroplaning to their summer resorts, I started on my systematic training course. I had never been intimately acquainted with the guy "who put the speed in speedometer," so my system began with a few lessons on this very important feature. Little by little I progressed until by the middle of August I was in perfect condition, and then I took the final examination. This called for pedaling up a long, steep hill without the aid of the motor, riding through a young river, making a 360-degree skidding turn on an oiled road without dismounting—and making a mile go-as-you-please in less than nothing. I then looked up my partner, Leo Kramer, and we sizzled out of Dayton on Saturday afternoon, August 31, at precisely 1 o'clock. We were bedecked in waterproof Yama Yama suits and on our luggage carrier we each had a trunk about as large as a fair-sized angel cake. On the starboard deck aft, we sported a blue-and-white Dayton pennant, and on the whole our mounts were quite impressive.

A "Loop-the-Loop" Performance.

Our first stop was Springfield, where we arrived at 1:55, after having "nearly beaten" a Wright aeroplane from Simm's Station to Fairfield. Mechanicsburg, our next stop, was reached in time to watch the sorrowful heavens

shed copious tears over the valley. After an hour's delay we chugged northward, and, on entering Marysville, I did a loop-the-loop on a freshly oiled street and landed on all fours on the front lawn of an old maid's home. Then I pushed my machine into the burg, where I borrowed a new wrench to straighten my crank-hanger. In doing so I put a dent in the jaw of the ding-busted tool, and when I showed it to the proprietor he made me pay a dime for the nick.

We ate supper at Caledonia, after which we took a fling at some night riding through the mud, in order to reach Galion as per our day's schedule. Never again! Between Martel and Galion, in inky blackness, we skidded over a five-mile stretch of the gluiest clay road it has ever been our misfortune to run up against. I have a distinct recollection of one particular spot where I did a glide almost into a cornfield, then a right-about-face for ten feet, finally countermarching and sitting down in the softest bunch of mire I have ever seen—or

at Strongville we found the fine brick pavement which extends all the way into Cleveland. We arrived in the Forest City at 2:47 p. m., and at 8:30 we boarded the *City of Erie* for Buffalo. Early the next morning we hunted up our steeds and found that during the night they had become seasick and had wallowed all over the saloon deck. Leo's machine had forgotten how to stand, while the fuel pipe line on my purrer was out of gear. After a little doctoring, we headed for Rochester, where we arrived at noon. About this time the heavens went in for an extended weeping spell, and we were compelled to take our restlessness out on the movies and the vaudevillians.

Geneva was reached the next morning at 10 o'clock, and here we were informed that a cyclone had just passed over that portion of the State. The president of the Ananias Club of that section greeted us, and his story of the pranks of the tornado was to the effect that it went out to Lake Seneca, on the outskirts of town, took a big hunk of water out of the center of it—and then put it right back in again. We canal-boated across Lake Cayuga and at noon slid into Syracuse. The scenery in this section of the State is scrumptuous and the roads are better than that. We dug through Utica and Herkimer, and at 5 o'clock, on entering Little Falls, we met two Cleveland speedsters with a twin Harley who had just made a too intimate acquaintance with a large stand-pipe. They informed us the road ahead was the worst ever, and we wisely decided to get up steam before venturing on. Suffice to say that we got through in good time.

The Arrival in Boston.

On reaching Palantine Bridge, the next morning, we found such fierce going that we hied ourselves to the New York Central Railroad tracks, which we rode almost into Fonda. It was on this stretch that my side kick, Leo, put on a little vaudeville spiel for the benefit of a bunch of yaps. We blew through Fonda, Amsterdam, Schenectady, and dined at Albany. The road and scenery through the Berkshires between Albany and Springfield beggars description. Time and again we stopped to feast our eyes, and it was with a pang of regret that we chugged on toward the coast. We reached the home of the Indian at 7 p. m., where we camped for the night.

"On to the sea" was the early morning cry, and we were soon whistling through the saucy city of Worcester and at 11 o'clock we blew in Commonwealth Avenue into the historic city

Elmer H. Gress.

felt. We reached Galion at 9:15, and after a splash in a two-by-six natatorium we were in dreamland in a jiffy. There is nothing like good sound sleep after a hard day on the road, bucking hills and sand.

After church the next morning we continued northward, passing through the beautiful towns of Mansfield, Ashland and Medina, and

of Boston. The champion Red Sox and the Senators were on the boards to mix things at Fenway Park that afternoon, and, being infected with baseballitis, we raved through nine stanzas watching our friend and fellow townsman, Clyde Engle, cavort around the initial pillow.

Leo Kramer.

The next morning we viewed Bunker Hill, Harvard and its stadium, retraced Paul Revere's epoch-making gallop, and at 2:45 left for Providence. On arriving at the Fall River Line docks we were rudely informed that our chuggers would have to be fenced up in order to be allowed to navigate with us. This necessitated the hiring of two wood butchers and the buying of a small size lumber yard, but after forking over half of our fortune our two-wheelers were allowed to bunk on the same boat with us while the latter migrated to the "City of Cities."

Doing the "Rube Act" in Gotham.

We did the rube act for several days up and down Broadway, and after saying "howdy" to Coney and Brighton Beach, we boarded the Weehawken ferry at noon on Monday, bound for Philadelphia. We reached the City of Brotherly Love at 6 p. m., and at sunrise the next day we headed our steeds toward Maryland. Lancaster was sighted at "elf uhr," and about the middle of the afternoon we rode through the picturesque battlefield of Gettysburg, which is promiscuously dotted with beautiful monuments and artistic tablets. After jogging over some rough and hilly country we rode into Hagerstown, where we stayed until the next afternoon as the guests of the writer's sister. Ladykiller Leo particularly enjoyed the ride from Philly on account of being greeted twenty-three times by pretty little lassies who gave us the glad hand and a winsome smile. We returned the smiles.

Riding the National Pike over the mountains from Hagerstown to Wheeling is like riding through a string of dilapidated stoneyards, but the beautiful scenery is a redeeming feature. At Romney, W. Va., in the heart of the fruit belt, we saw an orchard that was said to contain 90,000 peach trees and 12,000 apple trees. After being cross-questioned by a couple of reporters at "Stogieville," we crossed the Ohio

and chugged towards Zanesville in a misting rain. We left the home of the "Potters" the next morning, and just before reaching Circleville, Leo unwillingly chased five cows a mile and a half before they would allow him to set the pace. This seemed to get his engine's "goat," for three miles outside of Circleville his piston went bad. We procured a rope from a farmer, and just as we started the towing stunt a mule standing at the side of the road leaped out of his adornment and made a hasty getaway. Mr. Flying Merkel pulled Leo and his lame mount into Washington C. H., a distance of 23 miles, without hesitating. We continued on our homeward journey, and when within ten miles of Jamestown we unexpectedly tore into a stretch of loose rock, with the usual outcome when towing, of a scandalous spill for both. I did a jack-knife into a ditch to the right of the road, while Leo did a half-gainer into a cornfield on the opposite side.

Darkness overtook us and we gave the crippled chugger into the keeping of a farmer, and Kramer rode my luggage carrier into Dayton. We had enjoyed a fine 16 days' vacation and had some great experiences and barrels of fun, and were dee-lighted with the trip. Next year we will journey to—. Oh, well, that's another story.

SCHANTIN TO OPEN SHOP.

AS a result of his recent trip from Portland, Ore., to Portland, Me., Joseph P. Schantin, has contracted motorcycle fever and has decided to open a repair shop at 41 Grand Ave., Portland, Ore.

BOSCH VICTORS IN CANADA.

AT the recent race meet held by the Toronto Motorcycle Club, at Exhibition Park, Toronto, Bosch-equipped motorcycles won every event, while Bosch plugs were employed on two winners and three second-place machines.

AN ELMIRA ENTHUSIAST.

MISS MARY POPECK, of Elmira, N. Y., has recently joined the ranks of motorcyclists in her city. She became interested in the sport through riding with her brother, L. E. Popeck, but prefers now to pilot the

machine alone. She has suggested that her brother should purchase a new twin and turn the single over to her. All of which goes to prove that she is a full-fledged enthusiast.

Eleven motorcycles are now being used by the Building Inspectors' Department, of Cleveland, Ohio.

Lawrence Miller, Manager of Tuileries Motor-drome in Denver, Mounting the Prize-Winning Merkel in Recent Mountain and Plain Festival.

SHORT GRASS RACE MEET.

PAUL WARNER, of Ellsworth, Kan., won the club cup in the recent races held at Pratt. The program was arranged by the Short Grass Club, and like all other events conducted by this organization, it was a huge success. Riders from all parts of the state participated, \$300 being offered in prizes by the club. No less than 2,500 fans were on hand. After the races the ladies of the club furnished an informal lunch, and the club's president, as well as other officials, addressed the crowd. Summaries of races:

Three-mile amateur—Cosand (Indian), first; Chitwood (Excelsior), second; Penrod (Harley-Davidson), third. Time, 4:39.

Three-mile professional—Good (Indian), first; Johnston (Wagner), second; Wilson (Harley-Davidson), third. Time, 3:52.

Five-mile amateur—Chitwood (Excelsior), first; Penrod (Harley-Davidson), second; Humble (Harley-Davidson), third. Time, 8:15½.

Four-mile professional—Good (Indian), first; Warner (Indian), second; Wilson (Harley-Davidson), third. Time, 5:07¼.

Ten-mile pursuit race—Warner, first; Good, second; Wilson, third. Time, 13:23.

Five-mile amateur—Chitwood, first; Cole, second; Penrod, third. Time, 7:55.

Five-mile professional—Good, first; Wilson, second; Johnston, third. Time, 6:26¼.

Five-mile handicap—Warner, first; Good, second; Wilson, third. Time, 6:04.

One-mile against time—Warner won in 1:13½; Good, 1:15½; Wilson, 1:19½.

SIX motorcyclists of Medera, Cal., recently made a trip to Los Angeles to obtain boosting material for their home city.

As we had been looking forward to a motorcycle outing for some time we were glad when vacation time arrived, and our plans for a trip were soon completed. Stewart Price, my road partner, had relatives in Smithburg, Md., and as we wanted to travel in that direction, we decided to visit them. We started from Rutherford, N. J., in a heavy fog, but this did not last long and by 10 a. m. the sun was shining brightly. Neither of us had traveled

in Pennsylvania before so it was not remarkable that we should chose the worst route. Through Newark, Elizabeth, and down to Clinton the riding was very good, and it was not until we left the latter place that the roads began to give trouble.

The direct route to Reading, as we learned, was covered with loose stone, so that nothing remained but to go by way of Easton. This is anything but a good road; it led us over 14 miles of clay, with concealed rocks sprinkled throughout the entire distance. Just before reaching Easton I had a puncture in my rear tire, the only one of the trip. We soon left Easton behind, and the riding was fair from there to Allentown. We had expected to reach Reading that night, but I lost the nuts and spring off my magneto control and by the time we found a shop and were fixed up it was too late to continue. We left our machines at the shop of E. A. Hagenbuch, who showed us every consideration.

A Taste of Ignition Trouble.

As we were leaving Allentown Tuesday morning a native misdirected us and we found ourselves taking a roundabout way to Hamburg. The riding over this twenty-four mile stretch was simply awful; the so-called road could hardly be said to have a riding surface. On one of the worst hills Price's motor went dead, and thinking the trouble was caused by the grade we pushed to the top. On arriving there, however, no cheerful put-put greeted us. There was no spark, so we went over the wiring and it seemed O. K. On opening the battery case we found that the straw-board bottom to one of the cells had been left out, causing a bad short-circuit. At Hamburg new batteries were obtained, and they ended our ignition trouble. On our way to Harrisburg we passed through

beautiful farming country to Lebanon. En route, far up in the mountains, we passed a church that would have graced a city, and, strange to say, there were not more than a dozen houses as far as the eye could see. We soon struck the toll-pike, really a poor road, and when it comes to charging 22 cents to ride over it we feel it is rather rubbing it in. On our way to Harrisburg we passed Hershey, the home of the famous chocolate company. We reached Harrisburg about 4 p. m., and decided to remain overnight. We left our machines with the West End Electric Company, Indian agents, who filled our tanks and stored our machines free of charge.

Over Maryland Hills.

We were able to get some good pictures of the State House, also views along the Susquehanna River. Tandem riding is very popular in Pennsylvania's capital city at night. Leaving Harrisburg the next morning we paid

"At One Point Price's Motor Stalled."

two cents toll over the historic bridge. A heavy thunder storm overtook us at Carlisle, causing a short delay. From Carlisle to Chambersburg the macadam was in fair condition. On the Chambersburg Pike a toll was

again taken, 14 cents this time. Shortly after leaving Chambersburg we crossed the line into Maryland. Here the worst hills of the trip were encountered. Seven grades, all about fifty degees, were climber within three miles of riding. The course up the grades was little more than a trail. After about two hours of alternate pushing and riding we found ourselves at our destination, Smithburg, and we were glad of a chance to rest before undertaking the return trip.

KERR'S GOOD SHOWING.

FRED T. KERR, Emblem agent in London, Ont., and a well-known speedster, won four firsts, five seconds and three thirds out of thirteen races in which he competed during the past summer. In the remaining race Kerr was riding an Emblem single against a field of twins, and naturally failed to place. Kerr's friends regard this showing as quite remarkable when it is con-

sidered that the London dealer has found time to handle a thriving business and boom the motorcycle generally while carrying off his prizes.

THE NEW ORLEANS SQUAD.

NEW ORLEANS, La., is the latest city to "Indianize" its motorcycle police squad. Four of the 7 h. regular models have just gone into service. Before they were accepted by Superintendent of Police Reynolds, the machines were subjected to a strenuous speed test against a fast motor car on West End Speedway. Allowing the car a 300-foot start, the motor cops caught the flying four-wheeler in a little more than a mile, and immediately duplicated the feat over the reversed course. This demonstration convinced Superintendent Reynolds that nothing on wheels would get away from his men hereafter.

COSTELLO OPENS SHOP.

MIKE COSTELLO, well known as a pilot of Merkel racing machines in the metropolitan district, has opened a motorcycle headquarters with shop facilities at 86 Warburton avenue, Yonkers, N. Y. Costello has taken the Merkel agency for Westchester county, and is preparing to wage an active sales campaign with the opening of the 1913 season.

J. FRESE, of Spokane, Wash., with his wife and daughter in a side-car, is making a trip to Los Angeles on his seven Indian and will spend the winter there.

ENGLISH NOTES "BRITISHER"

Two More English Cyclecar Types; First Cyclecar Club Formed—Stanley Sets New Hour Record—Hub-bub Over Tires for 1913—Low's Novel Forced Induction Motor—Weatherproofing Machines.

I LITTLE thought when I forwarded a few timid paragraphs about cyclecars recently that this novel vehicle was going to knock spots off the whole trade for next season. The extent to which they are making good is shown by the fact that as I write a gathering of leading motorcyclists at the Holborn Restaurant are framing a Cyclecar Club, and that a leading firm of technical publishers have advertised a new journal entitled the *Cyclecar*, of which the first issue is dated for the eve of the Olympia Show. About 100 makers, small and great, are working like steam engines to get models ready for the autumn show and the spring sales.

The Rudge Cyclecar.

ONE of the most interesting cyclecars yet seen on the road is the Rudge, which is a genuine motorcycle, scaling only 4 cwt. in its experimental form, and capable of touching very near a mile a minute bat on a favorable road. It resembles nothing more than a giant's slipper, dropped on to a flat, low, spidery chassis, with the business portions of a motorbicycle stuck in its bows. Its final form will doubtless be prettier than the naked testing spider. It has a terrific appearance, when seen head-on, for the tubular frame is very narrow, and underslung in front, while the front wheels are widely splayed, so that the steering pivots, if produced, hit the ground where the front tires touch earth. Bang in

Standard muffler of British Auto Cycle Union, approved after exhaustive tests.

the fore-center of the frame is set a glorified edition of the standard, air-cooled $3\frac{1}{2}$ h. Rudge engine, but the piston stroke is no less than 132 mm., against the 85 mm. bore, and the power developed exceeds 8 h. on the dynamometer test. A multiple disc clutch is mounted on the crankshaft, and an enclosed belt takes the drive to a countershaft amidships.

THERE are large variable pulleys on the tips of the countershaft, controlled by a side lever, and affording ratios from 4 to 9 to 1. The back axle is a solid tube of high-grade steel, belt slip being relied upon to let the outside wheel overrun the inner when taking bends. The petrol tank of the experimental model is a disfigurement, for it consists of a swollen motorbike tank carried on struts above the engine, and its pointed front end does not soften its projections. Doubtless a better plan will be found for the final model. The dashboard comes close up to the raked steering wheel, and carries the oil pump, throttle, spark, and clutch controls, a valve lifter being the only lever on the wheel. Brakes consist of a pedal operating on the rear belt rims, and a side lever working extra shoes on the same rims. All four wheels are detachable and interchangeable, though the two wheels which carry belt rims would look odd on the front axle. Still, one spare wheel, provided with a belt rim would meet all emergencies. As the tires only measure $26 \times 2\frac{1}{2}$ inches repairs will be easy in any case. The rear springs are quarter elliptics.

The Humberette Cyclecar.

THE Humberette is a heavier, slower and more luxurious chassis, which follows the lines of a miniature automobile quite closely. It has an air-cooled V twin engine, set under a gauze-fronted bonnet; dimensions are 84 mm. x 90 mm. This chassis has a differential axle, shaft drive, and sliding gears, and is conventional in most of its details; in fact, it is just an ordinary two-seated automobile, as viewed through the wrong end of an opera glass. Its springing is unusual—an inverted, transverse quarter elliptic over the front axle, and quarter elliptics astern. Its chief novelty is a four-jet automatic carburetor (most of the cyclecars have automatic carburetors, with accelerator pedal control). It weighs 6 cwt., complete with cozy upholstered two-seat coach work, can do 35 m. p. h. and travel 50 miles on a gallon of gasoline, all in all, a very satisfactory showing.

New Hour Record.

G. E. STANLEY has set up a new hour record in the 500 cc. class on Brooklands track. He has a standard road racing two-valve Singer engine, 85 mm. x 88 mm., which can lap at 70 miles an hour for an hour without running hot. Unluckily for him he snapped an inlet valve spring in the last lap, and only just reached the tape, misfiring all over the place at about 8 m. p. h. In spite of this hoodoo and a standing start, he covered 67 miles 782 yards in the hour. Probably before the Show he will reel off a round 70, and there are one or two others who have a

bit up their sleeve. The great tip over this side is to send all the cracks out for the coveted records just before the Show, then the oil-stained machines are rushed up to town and put on the stand just as they finished. I enclose contours of the special racing cams fitted to roadster engines for these track sprints. Stanley is made of steel and india-rubber; he is one of the few men who can coil themselves into a bunch and sit for an hour on a palpitating lump of steel while it bumps over the rough cement at Brooklands, at breakneck speed.

Interesting English combination of seat and back-rest.

Heavier Tires Standard in 1913.

THERE has been a great outcry about the fitting of light tires in 1912. Competition has been fierce, and in the desire to keep prices low makers have continued to fit the same tires which were used ten years ago on low compression engines developing a bare $2\frac{3}{4}$ brake horsepower. These standard $26 \times 2\frac{1}{4}$ in. tires are listed at about nine dollars per cover, and on the back wheel of a modern efficient $3\frac{1}{2}$ h. machine, developing perhaps 7 brake horsepower, they did not average more than 1,000 miles. When they split or burst or wore flat, we usually fitted a much heavier type of cover, of the same dimensions, but embodying so much rubber that its price would be about thirteen dollars. The complaints grew so lurid that the tire makers compromised, and for next year they have brought out a new cover, with nominal dimensions of $26 \times 2\frac{3}{8}$ in., selling at eleven dollars; and the wide-awake motorcycle makers have decided to standardize this heavier and more costly cover.

The Choice of Tires.

AS an all-weather rider I find it essential to use a heavy and expensive cover, but when I have pulled my ten or twelve or fourteen dollars out ready for a purchase, I think twice. Many costly covers have such shallow corrugations on the tread, that although the cover may wear for 3,000, 4,000 or even 5,000 miles, it will cease to be efficient as a non-skid after 1,000. As a consequence, I invariably select tires which do not lose their anti-skidding properties until the tread is quite worn through. I favor two types. One

has deep sucker holes gouged out all round its line of contact with the road. One would fancy that punctures would occur frequently in these sucker holes, where the layer of rubber and canvas is at its thinnest, but in actual practice, I find this does not happen, and the only punctures sustained during the season were all caused by giant nails sticking in the thick of the tread. Apparently, if a nail catches in the sucker hole, the revolving tire presses it against the wall of the hole, and levers it out. The other type has a thick plain tread; but just wide of that part which rubs the floor, there are two sharp angular ridges; the instant the machine leans over for a skid, these ridges catch on the road and

jacket of an automobile engine. An eccentric on the camshaft drives a pump which feeds gasoline into this jacket, whereupon the heat of the cylinder flashes the volatile spirit into vapor, under very high pressure (due of course to sheer expansion). A transfer pipe takes this vapor to a rotary valve carried on the cylinder head. The valve action is as follows: an overhead inlet valve opens at the commencement of the induction stroke, and admits pure air to the cylinder, which is then compressed on the rise of the piston; as the piston reaches the dead center of its compression stroke, the rotary valve opens, and mingles the high pressure gasoline vapor with the compressed air, and a spark simultaneously

will be incapable of being "rained out," or proof against getting clogged up on a soft road so that the wheels will not go round. I mean we are gradually protecting every tiny part against mud and dust, so that a machine can be hosed down to clean it, and go just as well when wringing wet, as when it is dry and bright and new. This ideal is embodied out of a host of details. First of all, the ignition has to be absolutely encased. The switch is discarded, and aluminum plates, guarded by oiled paper washers, protect every joint on the magneto. The solitary wire that from the high tension brush to the sparking plug, emerges from a similar aluminum plate, through a waxed stuffing gland, has a fibre encased terminal at the plug, and finds its plug guarded by a vulcanite "umbrella." Nickel-plating is gradually being abolished. Nuts are finished in black oxidation; the usual plated parts are either stove-enamelled black, or covered with a thin skin of black celluloid varnish, by a secret process. Bearings are waterproofed by a dozen different methods. A popular device is to guard the edges of a ball bearing by an upturned flange, which shoots off water, tight fit and grease stuffing being superadded inside.

Open Mufflers Prohibited.

IN view of the government prohibition of the open muffler, the Auto-Cycle Union is taking immediate steps to publish the principles of efficient muffler design, and a public trial of different patents will be held early in December. A "standard" muffler has been constructed, as the result of tests with representative engines, and in the trial this muffler will rank as the canon of judgment, no device which permits more noise than the standard being accepted. The standard consists of an exhaust pipe of $1\frac{1}{2}$ in. bore, 15 in. in length, leading the gases to a plain cylindrical muffler, 14 in. long by 5 in. in diameter, and devoid of baffle plates; the final emission is by a pipe of one-half in. bore and 8 in. long. It is not suggested that the perfect muffler should follow this design or incorporate these dimensions. The prize will go to that design which is not less silent than the standard, and permits the highest technical efficiency compatible with silence.

Novel Forced Induction Engine.

DR. Low has now perfected a design for a forced induction engine, which will be of immediate interest to racing men, for it enables as much as 18 h. to be obtained from a cylinder capacity of 500 cc., which under old designs seldom allowed more than 8 brake horsepower to be developed from such a cubical limit. The main feature of the engine is that its cylinder is surrounded by a gasoline jacket, resembling the watercooling

occurring (via magneto), a terrific explosion results. The exhaust valve is normal in every respect. The lubrication is forced, by a mechanical pump, which oils the rotary vapor valve, as well as a piston trough and the main bearings. Muffling and cooling and lubrication are the main problems of maintaining the efficiency of such an engine, though metallurgical problems, including the gas-tight surfaces of the rotary valve and bearing pressures, are of course no child's play.

Weatherproofing.

ONE of the top notes of our Show will be the weatherproof machine. By that I do not mean simply that the 1913 machines

FORCED INDUCTION MOTOR.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.

6. The prize winners will be determined on the point system as outlined above by the editors of MOTORCYCLE ILLUSTRATED who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.

7. At least one dollar will be paid for every suggestion published.

8. Competitors are requested to address all their communications to Editor Improvement Contest, MOTORCYCLE ILLUSTRATED, 51 Chambers street, New York City.

THIEF-PROOF DEVICE.

TO prevent stealing of the machine, an attachment capable of being fitted to any stand is here shown. The stand D has riveted to it a piece T having a closed scroll B at its end, this scroll fitting snugly against the stay when the stand is down. A long shackled padlock P is fastened through the loop of the scroll and over the stay, preventing the machine from being wheeled away or driven off under its own power. Contributed by C. S. Pixley, Sacramento, Cal.

CELLULOID WINDSHIELD.

A CELLULOID windshield should be provided to protect the face and upper part of the body. It is fitted to three up-rights attached to the handle-bars, with the celluloid on the front or outside of the bracing. Contributed by Carl J. Heath, Andover, Mass.

ON an 850-mile tandem trip through Maine and New Hampshire, Mr. and Mrs. Ralph Jones, of Bridgewater, Me., received only one puncture.

CLOSING DATE

COMPETITORS in the Motorcycle Improvement Contest, and prospective contributors should note that the last improvement suggestions will be received for publication in the issue of December 26, and that the announcement of prize winners will be made in the following issue, that of January 9. Communications and drawings, to be eligible for consideration, must be in this office not later than December 20, so that they may be judged with the final suggestions to be published in the December 26 number.

OILING SYSTEM.

E. F. PHELPS.

TO insure positive oiling of the motor bearings, piston, and rod ends, a combination pump and sight-feed system is here shown

as satisfactory. The crankcase of the motor has fitted to it a pump or well A, from which is drawn oil by a pump D, operated by the motor. A lead E from D goes to a rack of three feeds G, each feed being fitted with sight-glasses. Lead F goes to the rear of the cylinder, and oils the piston, while leads H are for the main bearings. Within the sump is a stand-pipe J projecting into the crankcase and regulating the height of the oil therein into which the flywheels dip. This stand-pipe is provided with a hollow and ports K give communication with the interior of the sump. L is the oil-level in the crankcase and M the outlet to the pump D. A drain plug is fitted to J at C. Contributed by E. F. Phelps, Bridgeport, Conn.

A SHOCK-ABSORBER to fit any motorcycle is here shown. The tube G is fastened to the rear axle, and the bolt B, fitted

to the rear fork, is part of the double cone C. This cone C plays vertically on two stiff coil-springs A, A, which take up the road shocks. G is kept from revolving with the rear wheel by means of slides E, E, working on triangled rods D. These rods are fastened to the frame at F, F. Contributed by G. P. Rodgers, Pittsburgh, Pa.

A RADICAL CHAIN DRIVE.

SOMEWHAT startling ideas are involved in a new transmission system for motorcycles now being tested by a French inventor. He utilizes a chain throughout for driving, but combines the principles of both belt and chain drives by leading the

chain over the large rear pulley after the manner of an ordinary belt. By substituting sprocket wheels for the driving and tension pulleys, the slipping to which belts are subject, is of course eliminated, while the large pulley on the drive wheel remains the same as on a standard belt-drive machine, except that its groove is lined with special leather. Over this pulley the drive is by friction as would be the case with the ordinary belt, and the usual slipping operation is resorted to when the jockey sprocket is relaxed. Obviously, this entails quite heavy wear on the chain, and particularly on the rear pulley facing, and the practical value of the system may be seriously questioned.

Several years ago the makers of the French Alcyon machine fitted a similar transmission system on a type of light horsepower—1¼ horsepower or thereabouts—but this drive is not used on any of the company's present models. The drawing herewith is reproduced from a recent issue of *Popular Mechanics*.

SPIEGEL PENNANTS.

WHILE manufacturers are putting the finishing touches on new motorcycle models and equipment specialties for the 1913 season the Spiegel Art Co., of 111 Broadway, Brooklyn, N. Y., is also making a special effort to keep abreast of developments by beautifying its line of motorcycle pennants. This firm has been supplying the bulk of the pennants used by Eastern riders, and it is now preparing to handle its business on a much larger scale. The company announces that it offers no commissions, owing to the small margin of profit counted upon, and that its dealings are direct with agents. Full information relative to rates and the scope of the company's pennant line will be forwarded upon application.

IN the recent elimination run of the La Porte (Ind.) M. C., to Chicago and return, six out of the eight starters finished the run with perfect scores.

WARD WINS DERBY RACE.

ABOUT 500 enthusiastic newsboys were the guests of the management at the second meet at the Los Angeles stadium on Sunday, October 27. Considering the adverse weather conditions a big crowd attended the meet and race followers were rewarded by close and exciting finishes. Wold, though not a first prize winner gave several thrills by his high riding during the Angel City Derby. In the fourth race Rognon, the Salt Lake rider, was leading by half a lap in the last mile, when his chain broke, putting him out of the winning class.

The Angel City Derby, in which fifteen riders were entered, was won by Ward. It was easily the best race of the day, being run in three heats of a mile each. The final heat proved to be a neck to neck affair, with Ward, Humiston and Fleckstein riding almost abreast to the finish. In this event Wold made a game fight. Getting a bad start he was left almost half a lap behind, but he closed the gap and was just behind the leaders at the finish.

A NOVEL LAMP BRACKET.

ONE of the most interesting developments of late in connection with a motorcycle lighting system is involved in an improved bracket which is to be marketed by Gilnett & Henry, 366 Seventeenth street, Astoria, Ore. This bracket is fitted with springs and works on a swivel plan in such a way that the light projection in turning a corner is on a sharper angle than that taken by the front wheel. In other words, the light "beats the wheel around the corner," and thus enables the rider to observe objects in the line of his turn more quickly than with a light whose rays are thrown directly ahead in a line with the wheel. It will be noted in the photograph that the lamp is turned considerably off the line of the front wheel. When the wheel is

straightened, the lamp of course assumes its normal position and the light is thrown straight ahead.

SALT LAKE CLUB'S RUN.

ABOUT fifty members of the newly organized motorcycle club of Salt Lake City, Utah, recently held a run to Garfield.

BACK-REST AND SEAT.

WILLIAM H. HOWARD, of Chicago, is the inventor of the motorcycle back-rest described below. It aims to provide a sturdy rest for the rider when such a convenience is needed, and may also be lowered in such a way that it forms an extra saddle for the transportation of a tandem passenger. The rest may be lowered at the will of the rider while the machine is in motion so that it does not interfere with mounting or dismounting. A bracket 22 is secured to the

back of the saddle 14 by the rivets 23, and this bracket extends downward rearwardly from the backpiece and serves to carry a pivot bolt 24 for a lug 25. A post is screw-threaded into the lug so that it adjustably sustains the back-rest. The latter has secured to it a bracket through which the post 26 extends, and a clamping bolt holds the bracket and the back-rest in the desired position on the post.

The front of the back-rest is upholstered, and by adjusting the rest vertically on the post the rider may place it in the most comfortable position. When it is desired to use the back-rest as an extra saddle the post is lowered about its pivot 24. A forked brace provides a firm support for the rear end of the post 26 when the rest is being used as a saddle. This brace is adapted to straddle the rear wheel and has a seat 30 for the post, formed on its upper end, and its lower ends are bifurcated to engage the rear axle. When the brace is not in use it may be held against the rear forks of the motorcycle frame.

For the purpose of manipulating the back-rest or lowering it when the rider is about to dismount a lever is placed beneath the seat, easily accessible to the operator. It is possible to either raise or lower the back-rest while the rider is in the saddle by simply using this lever.

COLUMBUS, Ohio.—P. I. Haynes, of the firm of P. I. Haynes & Co., central Ohio distributor for the Harley-Davidson, reports unusual interest in the single-cylinder model.

THIRTY motorcyclists of Savannah have signed a letter requesting President-elect Woodrow Wilson to use them as an escort on March 4 during the inauguration ceremonies.

QUESTIONS and ANSWERS

REGARDING the replies to Question No. 8, explaining the action of a three-port, two-stroke motor, the really interesting ones were relatively few, but all showed thorough knowledge of the action of such a motor. The awards had to be made, consequently, in favor of those who employed the fewest words in describing the action of this form of two-stroke motor. Those which are here published can be read to great advantage by all motorcyclists, as the three-port motor is the best type of the two-stroke class.

The first prize in this contest is awarded to W. H. Ogle, of 1110 Third street, Moundsville, West Virginia. To Herman Ferns, of 94 Adelaide street, Winnipeg, Manitoba, is awarded the second prize. Honorable mention has been given the answer submitted by L. J. Egelberg, of La Crosse, Wis.

The series of contests now being conducted in this department will close with the issue of December 26, and announcement of the final winners will be made in the next issue, that of January 9. Contributors should submit answers to each question as soon as possible after its first appearance so that the work of judging and awarding prizes may be facilitated. All answers, and communications referring to the contests, should be addressed to: "Editor Questions and Answers, Motorcycle Illustrated, 51 Chambers street, New York."

Below are given question No. 9, that for which answers are now being received, and the new question, No. 10. Prize winners for No. 9 will be announced in the next issue.

Question No. 9. Which is the most desirable location for the clutch on a belt-driven machine?

Question No. 10. Which is the better method of fitting valves, grinding or truing?

FRANK

MERRITT

ACTION OF TWO-STROKE MOTOR.

(Question No. 8.)

IN this contest the first prize is awarded to W. H. Ogle, of Moundsville, W. Va., whose contribution is as follows:

"The three-port, two-stroke motor operates thus: Assuming the piston is at the end of the stroke next the crankcase (outward dead center), the exhaust port for the passage of the burnt charge from the cylinder is uncovered by the piston as is also the transfer port in the cylinder-wall. This port communicates with the crankcase by a passage generally cast integral with the cylinder, known as the by-pass. The crankshaft having been revolved toward its present position, there will be a slightly compressed charge of air and gas within the crankcase. The charge rushes through the by-pass and transfer port to the cylinder and on entering it strikes a deflector on the piston head on the side nearest the transfer port. This deflector directs the charge upward to the cylinder head.

"The incoming charge helps force out the exhaust which remains from the preceding working stroke, through the exhaust port. The piston now moves upward and compresses the charge, which is ignited at or before the upper dead-center. As the piston rises, it uncovers a third port, which establishes communication between the carbureter and the crankcase. The piston, moving upward, creates a vacuum in the crankcase and a charge rushes into the

latter from the carbureter. When the piston descends on the working stroke, the third port is first closed, then the exhaust port is uncovered (near the end of the stroke) and finally the transfer port, as mentioned above. The cycle of operations is gone through in two strokes: (a) working, exhaust and crankcase-compression on the down-stroke; (b) admission, and cylinder-compression on the up-stroke."

Winner of Second Prize.

The second prize is awarded to Herman Ferns, of Winnipeg, Manitoba. His answer follows:

"In a two-stroke motor, there is an explosion in the combustion chamber at every revolution of the crankshaft. Engines of this type are of two classes: Three-port and two-port, according to the number of ports in the cylinder-wall. In the three-port engine the piston acts as a valve, there being no special valves as in other types of motor. The position of the ports is such that when the piston is at its extreme upward position the port leading from the carbureter is open; when the piston is at its lowest position the other two ports are open. These ports are: that which allows the charge to pass from the crankcase to the cylinder and that which lets the burnt charge out of the cylinder. The latter is the exhaust port and is opposite to that port which allows the charge to enter the cylinder.

"It will be noted that these ports are opened only at the extreme outward and

inward position of the piston; between these positions they are covered by the piston. When the latter starts from its lowest center and a charge is in the cylinder, the exhaust and intake ports are successively closed and the mixture or charge is compressed. A partial vacuum is formed in the crankcase by the upward movement of the piston and the new charge rushes in from the carbureter, the crankcase being air-tight. When the charge in the cylinder is ignited, the piston descends, first closing the intake port from the carbureter and compressing the charge in the crankcase. When the piston reaches the lowest position, the exhaust port is uncovered and the burnt charge passes out. The compressed charge from the crankcase passes through the passage into the cylinder, the piston moves upward and the cycle of operations is again repeated. A deflector is fitted to the head of the piston directly in front of the port from the crankcase. This turns the incoming charge upwards and this new charge assists in expelling the burnt charge through the exhaust port."

Honorable mention is given to the answer of L. G. Egelberg, of La Crosse, Wis., which is as follows:

"The two-stroke cycle engine, more commonly known as the two-cycle or the two-stroke engine, receives a power stroke or impulse for every revolution of the crankshaft. In other words every other stroke is a power producing stroke. This engine has no valves opening into the clearance space, as are found in four-cycle engines.

"In the three-port type we have, as the name implies, three ports or openings into the cylinders; the exhaust port connecting with the exhaust pipe, the inlet port communicating with the carbureter, and the transfer port which joins a transfer passage leading to the crankcase.

"The ports are placed in the cylinder walls as follows: On one side we have the exhaust port, and directly opposite it the transfer port, both being placed so as to come immediately above the upper edge of the piston when the latter is at the bottom of the power stroke. Below the exhaust port we find the inlet port, so placed that it lies directly beneath the lower edge of the piston when the latter is at the top of the compression stroke.

"The action of this type of engine is as follows: When the piston moves upward the space beneath it will be increased, causing a suction in the crankcase, but as the latter is made airtight, nothing can get in until the piston reaches the top of the stroke. Here the piston uncovers the inlet port and through it air enters the crank case with a rush, picking up gasoline on its way through the carbureter.

"At the same time a mixture, previously supplied, is being compressed and exploded above the piston. As the sudden expansion of the gas drives the piston downwards on the power stroke it cuts off the intake port and compresses the mixture in the crankcase. As the piston reaches the end of the power stroke it uncovers the exhaust port, releasing the burned gas into the exhaust pipe, and an instant later uncovers the transfer port, blowing the compressed crankcase charge into the cylinder and at the same time forcing the remaining burned gas out through the exhaust.

"A deflector is generally provided for turning the incoming charge upwards, and so preventing it from mixing with the burned gas, to a greater or less extent. As the piston rises it cuts off the exhaust and transfer ports and compresses the fresh charge into the clearance space above, ignition taking place near the top of the stroke. Meanwhile the rise of the piston is drawing a fresh mixture into the crankcase, preparatory to its being transferred to the cylinder and exploded on the next power stroke, as described above. This series of operations is repeated as long as the engine runs."

MERITS OF MACHINES.

S. R. DE TURCK.—We cannot choose a machine for you from among the list submitted, as it is against our principles to make comparisons between the different makes of motorcycle. Even if we were partial to one or more makes, we would take a chance on not suiting you in recommending any machine, and all we would get out of it would be hard words. Get the various catalogues, and look over them, or better, if this is possible, communicate with some rider (not a racer but a road-rider) with experience on the motorcycles mentioned. In other words, ask the men that own them. The fact that a machine is "knocked" in one or more localities is nothing to its discredit. Certain neighborhoods are devotees of one machine and cannot see the virtues of any other make. The widely varying road conditions in different localities also influenced riders' opinions. So the "one best bet" is to remain neutral.

LONG STROKE MOTORS.

P. KIVIATT.—Your definition of a long-stroke motor is perfectly correct, and only the 5 h. twin mentioned can be considered as approaching that class. The reasons which have deterred motorcycle manufacturers from building true long-stroke motors are various. One is the limited overhead space between the tank and lower frame members. Another is the adherence of motor designers in general to various empiric formulas for horsepower, such as the S. A. E. and the A. L. A. M., both considering the bore as the chief factor. The latter formula is:

$$\frac{D^2 N}{2.5}$$

D being the diameter of the cylinder or the bore, and N the number of cylinders. This formula is only applicable for piston speeds up to 1,000 feet per minute. With a motor of $3\frac{1}{2}$ inch bore and $3\frac{3}{4}$ inch stroke, greater than 1,000 feet can rarely be got, and the formula is fairly accurate. With a motor of $2\frac{3}{4}$ inch bore and 5 inch stroke, according to this formula, the power would be 3, but the actual power developed at 2,400 r. p. m. would be 5.7 and the piston speed, 2,000 feet per minute.

The various classes, according to internal combustion engineering authorities are de-

rived from the bore-stroke ratio. Thus: long stroke, 1:1.66 and greater; medium stroke, 1:1.3 to 1:1.66; short stroke, 1:1 to 1:1.3; and "square," 1:1. There is no official name given to motors with stroke less than the bore, but we use the term "big bore" to indicate such ratios. The 1911 and 1912 Merkel motors are of this latter class.

TIGHTENING SPOKES.

B. KUHN.—With the spokes all set in place but loose, proceed as follows: Tighten with the nipple-wrench one spoke on the right and then the one opposite across the axis of the hub (on the left). Do the same with another spoke on each side of the hub, and so on. Verify the alignment of the wheel from time to time. Do not set down wrench-tight, but only half-tight; then when all are so tightened, measure the wheel from hub center to rim at several points for truth. Now tighten down all the spokes and measure again. Finally, spin the wheel on the axle. Use the ordinary nipple-wrench only, and do not employ too much force.

TWO-SPEED GEAR.

HANS ROBYN.—A two-speed gear such as you desire is the N. S. U., handled in this country by the Sun Motor and Supply Co., 307 Amsterdam Ave., New York City. The price is in the neighborhood of \$45.

AN AUTOWHEEL.

WITH a view of providing an attachment from which power may be obtained for the propulsion of an ordinary bicycle, Arthur C. Siebak, of San Francisco, Cal., has designed the motor-wheel shown in the accompanying illustration. The motor-wheel consists of a circular main

Siebak Motor-Wheel.

casing or chamber from one side of which projects an arm 2 that is connected to the lower frame bar of the cycle by a clip. There is one of these arms on each side of the main chamber. Within this chamber is

a cylindrical casing, divided into two parts, the first containing oil and the last gasoline. A circular extension fitted with two shoulders is provided and the cylinder of the motor is bolted to these shoulders.

The cylinder is fitted with a piston and connecting-rod and the latter is attached to a crank 17 carrying a pinion 20 meshing with a gear 21 on a shaft 22. This shaft 22 also carries a sprocket 23 and chain 24 which leads to the cycle pedal shaft. The magneto for ignition is driven from gear 21 which is mounted in extension of the armature shaft. Gear 21 meshes with an internal gear attached to the cycle-wheel and drives the latter by means of this internal gear.

SCHONACKER RESIGNS.

A. G. SCHONACKER has resigned as general manager of the Marvel Carburetor Co., of Flint, Mich., the condition of his health demanding that he locate in the West. Mr. Schonacker joined the Marvel company when its products were little known, and during his period of service he has seen the firm develop to the point where its next season's output is practically sold out.

ON BLACK HAWK STAFF.

ARCHIE McCULLOM, for some time connected with the New Era Auto-Cycle Company, recently accepted a position with the Black Hawk Motorcycle Company, of Rock Island, Ill., as designer and consulting engineer. He was tendered a farewell dinner at the Algonquin Hotel on the evening of his departure by the Dayton Motorcycle Club.

COLUMBUS, Ohio.—**L. P. Birkenbach**, central Ohio distributor for the Thor, will leave soon on a trip which will take him into every county of his territory. He will cover all of the southern counties of the Ohio River and many of the northern counties.

TIPS *And* TOPICS

WITH the season of mud and slushy roads almost at hand, the all-year motorcyclist is confronted once more by the problem of avoiding undue rust on his mount, and of carrying it through the winter in such condition that it will be fit for continued service in the spring. In this emergency there are several valuable wrinkles easy of adaptation. For example, a common-sense treatment with ordinary vaseline will reduce rust trouble to the minimum; it is best applied with a soft paint brush, and should be used quite liberally. Hubs, spokes and wheel rims should be given a coating, all nickelplating may be treated similarly and even the frame will benefit by an application of the grease. Fork and saddle springs, often entirely overlooked, should receive liberal doses of vaseline, as they are very susceptible to rust and none too easy to get at once the harm has been done. If these precautions are taken, the task of cleaning the machine after a hard ride over winter roads will be materially lightened.

RIDERS who lay up their machines for the winter should remove the tires, wash them with soap and water and then dry them carefully. They should next be wrapped in strips of paper or cloth and stored in a dark place, where the temperature is kept as nearly as possible at 50 degrees. Burlap sacks for enclosing the stored tires will afford additional protection. The wheel rims should be freed from rust and then coated with vaseline until they are to be used again. If the tires are to remain on the rims, jack up both front and rear wheels and leave about five pounds

of air in each tire. A simple stand for the front wheel may be devised by using pieces of board with a notch cut for the axle nut on either side, and with a cross-piece at the bottom connecting the two boards and acting as a base.

I WAS studying the phenomena of side-slip or skidding, as it is more often called, the other day when driving in the rain with a sidecar. The outfit was going over macadam roads, much treated with tarvia or some such preparation, and the camber of the roads was high. With the chair on the right-hand side, on making a left turn, the skid was considerable, almost amounting to a turn around facing the other way, but with a right turn there was practically no side movement. Braking only accentuated the skid, and this showed the need of brakes on the sidecar wheel as well as on the motorcycle rear wheel. My advice is, do your braking long before you reach the turn, and *roll* around the corners, correcting any skidding tendency with the handlebars by turning the wheel toward the side the skid shows signs of occurring on; this particularly on wet, high-cambered roads.

IT is often a seemingly obvious little mechanical wrinkle that helps a rider or a repairman out of a tight place, and the knack of acquiring such wrinkles is one worthy of cultivation. In this connection a Massachusetts motorcyclist refers to a tip which he picked up recently for keeping a level surface on a part which requires the use of a flat file. He points out

the tendency of the operator to give his file a downward twist at the end of each stroke, and states that a small mirror, placed just back of the vise in which the part is being held, will enable the file user to sight along the tool and thus keep it on an even keel, so to speak.

ONE student of gasoline engines states that he sometimes finds a puzzling leak in the intake pipe or carburetor connections by filling a common oil can with gasoline and squirting the liquid around the joints, with the engine throttled down. When the leak is reached and the outside application of gasoline is made the motor will pick up speed perceptibly and repairs may then be made.

WIRE controls sometimes develop cranky turns in mudlarking that would never reach a critical stage in ordinary summer roading, and the thoughtful rider will save annoyance and expense by using powdered graphite mixed with vaseline as a lubricant for the inner wire. Experienced motorcyclists have found this an excellent mixture, and have learned that it may also be used to good effect for valve guides and other parts.

JOHAN P. HOOPER, of Trenton, N. J., suggests that if three or four small stones are placed in a motorcycle muffler and allowed to bounce about while the motor is operated, much of the carbon that may have been accumulated will be loosened from the muffler walls and blown out with the exhaust gases.

Figure No. 4 shows a distinctive English frame with special trussing and mudguard fastening; figure 5 is a combination funnel and filter, recently placed on the market; figure 6 shows a device which cuts out the magneto when the brake is applied, and figure 7 is a new type of English sidecar top. It is noted that many recent English inventions relate to sidecars, particularly to the springing and trussing.

IS THIS FIRST AMERICAN CYCLECAR?

DURING all the hub-bub over English types of cyclecars—those ingenious first cousins to the motorcycle—there has been no indication of activity along similar lines by manufacturers in the United States, and for that reason special interest attaches to the accompanying photograph, showing what is probably the closest American approach to the British cyclecar types. The picture was unearthed in Philadelphia, Pa., by Arthur LaRoe, Indian agent in Perth Amboy, N. J., who in addition to being an accomplished roadster is a keen student of motor developments. LaRoe states that the novel little vehicle was built by William Pinaud, of Philadelphia, who uses a 2-cylinder, 2-cycle, water-cooled motor of the Lloyd type to drive it. The motor generates 12 h. p., is fitted with a mixing valve instead of a carbureter and drives by direct shaft and bevel gears to a

jackshaft, from which the power is transmitted to the rear wheels by a double flat belt system. There is a foot-operated service brake on the jackshaft, and emergency brakes on the rear wheels. Springing is by semi-elliptics in front and three-quarter elliptic springs in the rear; steering is by a fifth-wheel as shown. The machine has a wheel-base of 66 inches and a tread of 28 inches, 18-inch wheels being used.

Two seats are fitted, and not long ago Mr. Pinaud and a boy passenger made a run to Atlantic City, N. J., averaging about 22 m. p. h. While the construction of the Philadelphia machine is distinctive, almost throughout, it strongly suggests some of the lighter types of cyclecars now being poured into the British market, and for this reason its discovery by the New Jersey agent should be of interest to motorcycling in general.

"SHORTY" A YALE MAN.

TOLEDO, O., November 4.—A new man on the Yale traveling force is "Shorty" Matthews, the rider who has started at so many dirt track meets in Illinois and neighboring States during recent years. He has

quit the racing game and will give his attention entirely to business. He will probably ride a Yale in the big endurance runs next season and perhaps in a few hill climbing contests. Just now he is on a trip that

will cover Illinois, Iowa and Missouri, and on the route he promises to keep the factory busy filling contracts.

WITH WELDING COMPANY.

FRANK DEWITT, formerly connected with the Columbus Bolt Works, Columbus, O., will succeed Grover C. Thompson as representative for the Electric Welding Products Co., of Cleveland, his territory being Ohio and Indiana. Mr. Thompson is now on the staff of the Michigan Electric Welding Co., of Detroit.

FREEMAN IS SALES MANAGER.

F. D. FREEMAN, formerly retail sales manager for the Aurora Automatic Machinery Company, and later connected with H. T. Roberts in Chicago, has severed his business relations with the latter to take up the duties of sales manager for the Excelsior Cycle Company.

LIMA, Ohio.—Williams, "The Motorcycle Man," located at 301 West Erie street, has closed a contract to represent the Indian in that territory for 1913.

A. HOLOFCENER, who recently opened a store in Baltimore, has taken the agency for the Yale in Baltimore and vicinity.

IMPROVED J-D PLUG.

AFTER exhaustive tests and consultations with leading motorcycle engineers, the Jeffery-Dewitt Spark Plug Company, of Detroit, has produced a porcelain motorcycle spark plug which promises to meet a steadily increasing demand among motorcycle riders. The new plug is a distinct type—as distinct as the other leaders of the Jeffery-Dewitt line, the Reliance and J-D—and it promises to take the place of the widely used mica plugs, by reason of its longer life and better service.

The shell or base is a little over half the length of the ordinary shell, and is so designed that it protrudes into the cylinder exactly the right distance for the best results. The bushing is so designed that the upper shoulder of the porcelain sits far into it, allowing a higher seat of a shallower base than could ordinarily be used. This permits the use of a porcelain with a heavy shoulder and with length enough below the shoulder to insure the proper insulating surface, thus giving the plug several unique and valuable features. The terminal nut is designed to take ordinary wire or a ring slip, or special Indian terminal.

The porcelain for this new motorcycle Standard Spark Plug is the product of the Jeffery-Dewitt potteries, renowned for heat-defying qualities.

FROM A TRENTON ENTHUSIAST.

GEORGE B. YARD, of Trenton, N. J., thinks he has a record for troubleless riding on his Emblem. Writes George: "My 1911 twin has carried me through two

seasons without a penny spent for repairs. Bent a pedal several times, but aside from that I have had no trouble whatsoever. I have ridden about 10,000 miles and have ground in the valves only once. The engine has never been taken down."

"BOSCH—OF COURSE."

THAT the Bosch magneto was retained on Indian machines for 1913 would no doubt be taken for granted, regardless of announcements, but this does not account for the failure to specify the Bosch in the article dealing with new Indian models in the October 31 issue. The magneto specification was omitted inadvertently, the article simply stating that the ignition would be the same as last year.

The Greatest Harley-Davidson Eight Honest Horsepower

THE Harley-Davidson twin is instantaneously responsive to the throttle—off like a flash—picks up quickly—no faltering hesitation—no sluggishness—no snorting or popping.

It does not have to be babied, nursed or coaxed into action—it's *all there*. It's a real downright pleasure to handle one.

And it starts easily. The great bugbear of many twins is their hard starting. No use trying to dodge the fact. Everyone knows they *do* start hard.

You don't have to prime the cylinders of a Harley-Davidson, even in cold weather. In fact, there's no primer on it and never was. The twin Harley-Davidson motor turns over like it should—easier than most singles—not like a twenty ton winch.

Correct design (and this includes proper balance of all moving parts), good material and the very highest grade workmanship obtainable have long since established the Harley-Davidson as the most satisfactory motorcycle.

All Harley-Davidsons incorporate the patented Ful-Floteing Seat and Free Wheel Control—both exclusive features.

Harley-Davidson Motor Company

306 C Street

Milwaukee, Wis.

Producers of high grade Motorcycles for eleven years

OPENED MANSFIELD QUARTERS.

AN account of a storm a small attendance marked the opening of the new club-rooms of the Mansfield (Ohio) Motorcycle Club but the program did not lack enthusiasm. The club was organized a year ago last August with nineteen charter members. Since that time the membership has increased to 55, and a creditable sum is stowed away in the bank. This money has been gathered by the club from various race meets. The Mansfield club is said to be one of the liveliest clubs in its section of the state and it is doing much to advance the sport. Race meets, sociability runs and endurance runs have been held regularly. The accompanying photo shows the members who figured in the opening of the new rooms.

ARUN to Louisville over a 300-mile course was recently held by the members of the Indianapolis (Ind.) M. C. Out of twelve starters five had perfect scores.

UNIQUE PRAIRIE SCHOONER.

ONE of the most distinctive features of the recent Short Grass tour was the Velie "Prairie Schooner" which accompanied the tourists and carried the baggage. The accompanying photograph shows this machine, popularly known as the "Velie Number 4," it being the fourth automobile turned out by the Velie factory. It was the first Velie 40, and the first touring car of its type to appear in Kansas City. It has seen constant service for several years, and according to records has covered 50,000 miles. Before the Short Grass tour the touring body was removed and it was equipped as shown in the picture, the equipment in itself making quite a load. This car, although carrying a load of 2,200 pounds of baggage, came through the ordeal with practically a perfect score and at one time it carried 18 men in addition to the regular baggage. The total expense of the car on this trip, for running and repairs, was just \$1.80. Goodyear tires were used. On its arrival in Kansas City, without being repaired in any way, it was turned over to the largest department store in the city and is now being used by them for delivery purposes.

A MERKEL WINNER.

AT the third annual race meet of the Lancaster (Pa.) Motorcycle Club, Harry C. Becker, of Reading, riding a single cylinder, ported Merkel, lowered the track record from 1:16 to 1:09. The former record was made three years ago and since that time numerous attempts to break it have been unsuccessful.

LOUISVILLE AGENTS.

RAY BROS. will sell the Yale for 1913, in Louisville, Ky., and in some territory in Kentucky and southern Indiana. The 1913 contracts were signed up at the factory in Toledo a few days ago by C. A. Ray.

The firm is going to wage a strong campaign for next year and plans are laid for extensive newspaper advertising.

PLANs for forming a motorcycle club in Delaware, Ohio, are materializing and the riders hope to have an active organization long before the 1913 season opens.

LONG REPLIES TO COCHRANE.

EDITOR MOTORCYCLE ILLUSTRATED:

Following up my recent argument with reference to the Bennings Labor Day meet, I wish you would print the following: While I do not approve of "chewing the rag," I wish to make an exception in this case by answering Mr. George T. Cochrane, president of the Washington Motorcycle Club, relative to his article in *MOTORCYCLE ILLUSTRATED*, issue of October 3, under the heading "Bennings Situation." Mr. Cochrane says "the track was in perfect condition." I wish to ask him what caused Mr. Marsh to burn up a machine that day? Answer: he could not hold it in the sand and pump oil at the same time. Why did another rider go two miles and then quit? Answer: "too much sand."

If the track was in perfect condition, why was there special need of oil? Mr. Mangold, who won the two races, sent two postal cards to the meetings of the racing men, which were held on the Thursday and Monday preceding Labor Day. These postals were read, passed around and later filed. They are now available as evidence.

Mr. Cochrane is partly correct regarding the novice question, where Messrs. Mangold and Marsh are concerned, but the others were really novices. Mr. Meyers' first race on the track was on May 13, this year, and he had not been on again prior to the Labor Day meet. Mr. Cochrane is wrong when he says Mr. Mangold is the best rider in the District of Columbia, as Tommy Dedge (holder of the championship here for the past three years) has beaten Mangold out in every race he was entered.

The races on Labor Day were not satisfactory from the spectators' standpoint. I refer Mr. Cochrane to the *Post*, *Herald*, *Times* or *Star*. They said the races were unsatisfactory. The prize money, as stated lately from the promoters, was as follows: First race—first prize, \$15; second prize, \$10; second race—first prize, \$25; second prize, \$15, as against the figures of Mr. Cochrane.

FRANK LONG.

Washington, D. C.

Twentieth Century "Prairie Schooner" that Attracted Much Attention During Recent Tour of Kansas Short Grass Club.

FROM THE PHILIPPINES.

THEODORE SIDDALL, secretary of the Luzon Motorcycle Club, of Manila, P. I., forwards the accompanying photograph of some of the club members who

participated in a recent outing. From left to right they are: Squires, president; Phillips (two visitors), Gavagan, Walker, Grodske, Case (two more visitors), Albright, Siddall, Gasser and Kelly. The pic-

ture shows about one-third of the club's membership. Secretary Siddall reports that many of the roads afford fair going in clear weather, and that steps are being taken to improve the best-known routes.

A RUN TO JOPLIN.

MEMBERS of the Springfield (Mo.) M. C. recently participated in a run to Joplin. The distance is 100 miles each way and was covered in four hours.

NEW USE FOR THE SIDECAR.

SIDECARS have been generally considered as pleasure vehicles exclusively, but the Department of Water Supply, Gas and Electricity of New York City has discovered an interesting and practical field in which this type of attachment has wide usefulness. After careful investigation the department has ordered a Majestic sidecar for the use of one of its engineers whose duties lie in the Long Island district, and it is believed that the car will prove a valuable acquisition, as it will enable the engineer and his assistant to cover their field rapidly and attend to duties in widely separated localities.

CHANGED HIS MIND.

SOME time ago C. L. Scrivens, of the Scrivens Motor Car Company, of Ashtabula, Ohio, announced that he was desirous of withdrawing from the motor field and he held to this opinion until he paid a visit to the Harley-Davidson factory recently. While at the plant Scrivens talked the matter over, examined the new H-D models and then decided to stick to his headquarters in Ashtabula. He will handle the Harley-Davidson machines in his district.

MEMBERS of the Freeport (Ill.) Motorcycle Club recently participated in a 98-mile jaunt through Forreston, Polo and Dixon to Sterling and back by way of Forreston.

DES MOINES M. C. SMOKER.

MANY forms of amusement and entertainment were offered those attending a recent smoker of the Des Moines (Iowa) M. C., and the members broke records for enjoyment.

A PLAN is being advanced by motorcycle riders in Perth Amboy, N. J., to form a local organization and affiliate with the F. A. M.

AT a recent meeting of fifty motorcyclists of Piqua, Ohio, the Harley-Davidson Motorcycle Club was organized. Officers were elected and arrangements were made to secure permanent quarters.

FORT WAYNE DANCE.

A DANCE recently given by the Fort Wayne (Ind.) M. C. was heartily supported by the members and no less than 224 couples took part in the grand march. Eighteen prizes were awarded.

DATE FOR HERRING RUN.

THE annual Herring Run, which marks the opening of the touring season of the Providence (R. I.) Motorcycle Club will be held Sunday, April 28, to Taunton, Mass.

OTTO NICHOLS has been elected president of the newly-organized motorcycle club of Reedley, Cal., with Lloyd Wicks, vice-president, and Charles M. Knauer, secretary.

A NORTHWEST BOOMER.

IN the accompanying photograph appears a squad of riders snapped at the motorcycle garage of Axel Kildahl, in Lents, Ore., a sub-

urb of Portland. Kildahl handled a big business in M. M. models throughout his district for 1912, and has placed an order for Eagle machines to round out his line for the coming season.

MORE TIPS ON MOTORCYCLE LIGHTING

Veteran Rider Points Out Vital Importance of an Efficient Illuminating System and Gives Some Generator Data—Information Gleaned From Widely Varied Lamp Experiences

By GEORGE M. JOHNSON

A GOOD lighting system is really as essential for a motorcycle as for its big brother, the automobile, since there are probably few riders who never use their mounts after the shades have been pulled down. If a motorcycle is to give its owner perfect satisfaction, not only must it deliver the goods itself, but its equipment must be high grade in every particular. In this connection a first-class lighting system is something that will quickly prove its worth. How many four-wheelers that you see about the country depend on generators to supply the gas for their headlights. They are quite rare, and when you do find a man whose car is generator equipped, he is usually on the point of changing to tank service, or else he never expects to use his machine after dark. Here is one place where motorcycle riders could profitably follow the autoists' example.

Of course, there are some generators that render satisfactory service; personally I have never seen or heard of one, yet a few doubtless exist somewhere. But in the main a generator has more natural, out-and-out cussedness concealed within its harmless-looking exterior than a whole squad of army mules. Only lately two friends of mine took a five-hundred-mile jaunt, and one was giving me some details of their trip. His headlight is supplied by Presto tank; the other chap depends upon a generator. Incidentally he remarked that they did quite a bid of night riding.

"How did your lights work?" I asked. "Have any trouble with 'em?"

The tourist laughed.

"I didn't," he rejoined, "but every single time Partner tried to light up, there was something out of whack with that blessed generator of his."

Some Generator Tips

I personally have known several generators, and every last one of them gave trouble, varying in degree from a light that was unsteady and flickering, to one which failed utterly when I was miles from home on the darkest night of the year. I never had any satisfactory night use of my motorcycle until I discarded all generators and put a tank on the machine. This is not a paid ad. for any tank company, but a simple statement of fact from my own experience. The first point, then, which I wish to emphasize, if you would keep your lighting system at its highest efficiency, is the consignment of that generator to the scrap. Some generators need very careful nursing and they are rarely worth the trouble.

But there are a few facts it is well to remember if you persist in using a generator, for you may be one of those who stick to them. Most important of all, clean it after every using, even though it was in operation only a short time. I once made a carbide sifter by pounding a number of holes through the cover of a cocoa tin. When cleaning or recharging the generator, I would simply pour its contents into my sifter, put on the cover and shake, in that way easily separating the used carbide from what was still good.

If your generator is one of the screw to-

gether variety, don't fasten it up to tightly. I did that more than once, and had a sweet time getting it apart again. If it does stick, you can usually start the threads by fastening the perverse thing in a vice, then gripping the free end with both hands.

Danger with Small Lamp

Some riders are out after dark so rarely that they employ merely a bicycle lamp, which gives light enough for city use. Once or twice I have seen these small lamps fastened to the fork of a machine, within the radius of the front wheel. That is an exceedingly dangerous arrangement, and should never be resorted to. I tried it one time on a push bike, before I graduated to the motorcycle class, and received proof of the danger involved. The clamp jarred loose, letting the lamp swing down between the spokes of the front wheel as it revolved, and you can easily imagine the result. Half the spokes were ripped out of the rim, and the fork was badly sprung, while I described a graceful curve over the handle bars, ploughing up a fair amount of macadam road with my body. The

A good auto or motorcycle searchlight does this. If a machine is traveling at all rapidly, a bicycle lamp will not light up far enough ahead to make it safe for the rider. In other words, before he can see an obstruction, he will be too close to it to stop, whereas the typical headlight will enable him to spot a lightless vehicle a long distance away.

Fitting the Tank

There are three common ways in vogue of attaching a gas tank to a motorcycle; on the top bar above the gasoline tank, across the handlebars, and on the luggage carrier. The main objection against the first two methods is that the tank is likely to sag over to one side or the other; its weight, combined with the jolting of rough roads, is a big strain for the none too heavy clamps provided. These last, in turn, are sure to mar the enamel or nickel plating unless a liberal wrapping of tire tape is first applied. If the tank is very far from the headlight, one should use copper tubing rather than rubber, for the latter goes to pieces very quickly, especially when bent into a circle. Have the copper tubing extend as

"Some Generators Need Very Careful Nursing."

possibilities of such an accident are increased a hundredfold if the vehicle is power driven; the lamp will be far more likely to be jolted loose, and the results would probably be quite serious.

Using a bicycle lamp on a motorcycle is dangerous from another standpoint, whenever the machine is ridden out into the open country. A bicycle lamp lights up the ground for a few feet ahead very brightly, but it is not so constructed as to send a long, narrow tongue of light down the road before the machine.

close to where the connections are to be made as is possible, so that only short lengths of rubber tubing need be used to join the copper to your tank and light.

In making connections, put two turns of tire tape about all the metal ends, and moisten this with gasoline to make the rubber tubing slip on easily. If the whole length of rubber connection is then carefully wrapped with tire tape, it will last indefinitely; if unprotected in this way, the rubber will probably require renewing at more or less frequent intervals.

The Excelsior Has Always Made Good

The Excelsior Has Always Made Good

Mechanical Changes

The Excelsior catalog tells the story in detail of the 1913 improvements. There's nothing drastic, nothing sensational, nothing outlandish. All made possible because we haven't sacrificed our good mechanical sense. But there are many improvements that make for ease of control, readiness with which parts can be reached, etc. More than ever will the Excelsior be the strong, swift and sensible machine.

Speed

The Excelsior racing records have been made with our regular motors. Not special motors made just for the track, mind you,—but our stock motors. Let that sink in, please. The 1913 "7" actually develops 10 horse power. That's the kind of a motor you want.

Economy

The Excelsior has it on all when it comes to economy. Why, it's a regular "tightwad." Mr. R. P. Miller of Chicago in a sworn statement says that he covered 119 and a fraction miles on one gallon of gasoline on an Excelsior 7 Twin. Only another instance of Excelsior value! This remarkable power has been developed without increasing the piston displacement. The 1913 Excelsior is the most powerful 7 h. p. motorcycle motor ever built.

Riders Know the Facts Better Than Ever

1913 will witness the advent of thousands of new motorcycle riders, but just because they are "new" is no reason to suppose that a man is going to step into a store and say "Give me a motorcycle"; that he is going to take the first machine that is offered him. These new riders—and thousands of experienced others, too, for that matter—are going to make the most searching examination in comparison before they buy. They will demand power, speed and durability. The best machine is going to come out on top and the dealer will profit most if he handles the machine that will meet the demand; and if you secure the Excelsior agency now, you will be in a position to supply a machine that will please the "hard to please." The price on the Excelsior Auto-Cycle is right and the machine is right.

Riders Waited for the 1912 Excelsior

This year, despite the disadvantage of a late start, we have produced more than 9,000 Excelsior Auto-Cycles and it is our sincere belief that they are the best 9,000 motorcycles that have every touched the road.

Hundreds of these riders could easily have purchased some other make, but they preferred to wait and they did wait, but there will be no wait in 1913.

Demand for Excelsiors Will More Than Repeat Itself In 1913

For 1913 we have planned to build 25,000 Excelsior Auto-Cycles and they will be better than ever. We have the capital and equipment. More than half of our output is already sold. Dealers who want to get in with the Excelsior for 1913 and share in the big business are respectfully asked to talk "turkey" quickly. We are not going to take more orders than we can deliver. We require shipping specifications from our dealers and will make good on deliveries.

If you want more information, as you surely should, then fill out the coupon now. Please mail it today. Some other "live wire" may write tomorrow—you write today.

Something About the Excelsior Organization

The Excelsior Auto-Cycle is today a better machine than it ever was. The Excelsior organization, in factory, office and agencies, is more capable and efficient than ever. There is no waste of expense—no lost motion—no lack of harmony. "Good results." That's the thing we do and we do it right and with the least expenditure of time and money.

The present management brought to the Excelsior 37 years of successful manufacturing experience. We know how to make motorcycles and make them right and we have the inclination to actually make them right. No makeshift or slipshod methods go here—no skimping to save a dollar—no false economy. We do not merely "assemble" machines—we "build" them.

1913 Accomplishments

For 1913 we will produce four models. In fact, we have carried standardization to the extreme limit. We have embodied the best features in former Excelsior models in this new machine. We have also added many refinements and several practical improvements.

All the new features in the 1913 Excelsior have been rigidly tested here and they are right—so right that we believe the 1913 Excelsior will be the most satisfying motorcycle the trade has ever known.

SOME FIGURES

Harley-Davidson Company Tells How \$76,000 Went into Machinery Needed for Doubling Its Factory Output.

ACTING in the belief that figures are always interesting the Harley-Davidson Motor Co. has prepared a brief statement outlining some of its improvements and expenditures for the year ending October 1. It shows that the company purchased machinery costing \$75,945.48 during the year, and that all the machines included in this sum are now in use. These figures, however, do not cover new machinery for the factory in course of construction, nor do they take into account hand tools. The factory addition, containing 90,000 square feet, which was completed on September 9, represented an outlay of \$100,000, and the machinery equipment for that building cost \$75,000.

The largest item, \$18,017.50, was for lathes. This sum covers 35 lathes for various departments. Then comes an item of \$15,887 for automatic screw machines, 13 automatics being included in this bill. The larger automatic screw machines used in handling round and hexagonal stock, cost \$2,400 each. Considerable money has also been expended in the gear hobbing department. Six new gear hobbors were purchased during the year at an outlay of \$7,200, or \$1,200 apiece. Thirteen milling machines were installed at a cost of \$8,764.50, and 28 drill presses were purchased for \$6,164.12. Seventeen grinders meant an outlay of \$7,943 and five shapers cost \$2,150. An additional outlay of \$3,510 was made for punch presses. These figures show the trend of the improvements, but they do not cover a number of items ranging from \$1,000 downward, all of which were needed to permit of doubling the company's output of machines.

THE FOREIGN MARKET.

THE standing which American-made tires are attaining in foreign countries in competition with the product of the best European factories is strongly indicated in an announcement made by Backdahl & Company, of Stockholm, that they have just closed a contract to supply 750 sets of United States Tires for taxicab service in Norway, Sweden, Denmark and Finland.

The United States company's increase in foreign trade is going beyond all expectations.

FIRST DAYTON DELIVERED.

THE Davis Sewing Machine Company, of Dayton, Ohio, delivered its first Dayton motorcycle to the Beckley Ralston Company, of Chicago, on October 29. Mr. Huffman, sales manager for the Dayton, states that from now on a steady supply of the new machines will be turned out and that prompt deliveries may be expected.

Miss H. Georgie Merrill, of Cumberland, Md., on 7-h., 2-speed Indian.

VAN CLEEF ACTIVITY.

A REPRESENTATIVE of Van Cleef Bros., Chicago manufacturers of the standard line of cements and motor specialties which has become widely known in late years, is now on an eastern trip which has resulted in the lining up of much new business for 1913. The firm has a big factory at 7709-7711 Woodlawn avenue, Chicago, which is being improved in several departments with a view of satisfactorily meeting an increased demand for Van Cleef products during the coming season.

THE Fisk Rubber Company, of Chicopee Falls, Mass., is building a new branch house and service station adjoining its present quarters at 456 Milwaukee street, Milwaukee, Wis.

FIFTY PER CENT INCREASE

This Is the Basis Upon Which United States Tire Company Is Planning Output for the 1913 Season.

IN planning for their 1913 output, tire manufacturers are proceeding along broader lines than have ever been known in the history of the motorcycle industry. The reason for this expansion of production facilities, as might be taken for granted, is that there will be a greater demand for motorcycle tires next season than ever before. With the prospect of over a quarter of a million machines in operation it is very evident that a wonderful bulk of tires will be required to keep them going.

Commenting on next season's prospects, from the tire-maker's point of view, M. C. Stokes, eastern district manager of the motorcycle department of the United States Tire Company, has the following to say:

"Our 1912 business was fifty per cent. ahead of that of the year previous, and 1913 certainly will show an advance of fifty per cent. over this year. The factory business for which we have already contracted for next season, is a pretty good indication that 1913 will be a hummer. The manufacture of motorcycle tires used to be incidental to the production of automobile tires, but this is no longer the case. The business has grown so remarkably during the past three years that making motorcycle tires is now an industry by itself and the United States Tire Company so regards it. We are constantly increasing our motorcycle equipment so as to give us the output necessary to fill our orders.

"We are announcing a new chain tread tire, which gives us four styles of tread—chain, nobby, studded and corrugated. Another important innovation in our tires is that in future they will all be made of white stock, giving them an exceptionally trim appearance."

TWO NEW AGENTS.

J. LOUIS ANDERSON, of Salt Lake City, and the Texas Auto Company, of Fort Worth, Texas, have contracted for the 1913 Harley-Davidson agencies in their respective cities. Heretofore the motorcycle has not received the attention due it in these localities and the Harley-Davidson agents look forward to big things. With extensive plans under way for road improvements the motorcycle outlook in this section is very bright.

THE YALE "FLYING SQUAD."

A NEW idea in covering territory has been launched by the Consolidated Manufacturing Company, of Toledo, Ohio, which now has twenty salesmen known as the Yale

"Flying Squad." They left Toledo recently on a trip that is intended to cover the state of Ohio thoroughly. The plan is to divide the state into strips lengthwise and assign one squad of riders to each strip. They are to begin at one end of the state and work to the

other. En route they will close contracts in each town and city for the 1913 Yale products, picking out the most active dealer in each town. By the time these squads have traveled the length of the state, the Yale will be well represented in every locality.

THE ATLANTA WIGWAM

Handsome Hendee Branch Now Under Way Will Afford Southern Motorcyclists Every Convenience.

SURPASSING in architectural beauty and luxurious appointment any establishment of its kind in the country, the new Southern branch of The Hendee Manufacturing Company at Atlanta, Ga., typifies a fitting recog-

New Hendee Branch in Atlanta, Ga.

nition of the substantial growth which motorcycling is enjoying in Dixie Land. Centrally located at 457 Peachtree St., the city's main automobile thoroughfare, the building is provided with special facilities for efficient conduct of the motorcycle business. Steel and brick predominate in the construction, now under way, and it is expected to be ready for occupancy December 1. Standing two stories with basement, one-half of the handsome structure will be occupied by The Hendee Manufacturing Company, which will utilize a floor space 25 x 125 feet approximately, for all floors. Complete elevator service is provided. With its white tile facade and large double plate-glass windows with luxfer prism panels, the building possesses a quiet but rich appearance which enhances the already notable prestige of the boulevard on which it stands.

An extensive stock of all models and parts, and a complete service department will be maintained, the station providing full factory facilities at short range for the States of North and South Carolina, Georgia, Florida, Alabama, Mississippi, and Tennessee.

On the first floor will be located the sales rooms, parts and accounting departments, and the manager's private office. Upstairs a reception room, tastefully appointed, will be maintained for visitors. One of the features of the establishment will be the service department in the basement, which will be equipped to execute any repair on an Indian motorcycle.

The rear of the structure is inset from the building line, affording an open-air court, with overhead shelter, which will accommodate a large number of machines. Access to the service department is afforded by two contiguous passages at the rear, the street grading being such as to permit of a machine being ridden directly onto the garage floor.

The branch will be in charge of W. E. Johnston, who is a native of Atlanta. Just having relinquished the management of the Denver branch, he is exceptionally well

MINNEAPOLIS PLANT IS IN NEW HANDS

Backed by Strong Organization, Recently Formed Minneapolis Motor Company Will Continue Manufacture of Improved Models, in an Enlarged Plant—Incorporated for \$500,000.

AT the annual meeting of the stockholders of the Minneapolis Motorcycle Company, held at the executive offices of the company at Minneapolis, Minn., on November 4, it was unanimously decided to accept a proposition made by a company consisting of some of the most influential business men of the Northwest, that they purchase the business of the Minneapolis Motorcycle Company outright. The new company, known as the Minneapolis Motor Company, is incorporated for \$500,000, and is transferring the business to a large plant, admirably adapted for the manufacturing of motorcycles in large quantities. The name of the machine will remain the same, but almost a complete change is noted in the personnel of the company.

P. M. Starnes, the president of the new company, is well known in industrial circles. He is vice-president of the American Timber Holding Company, and is connected as officer and director with a number of financial and industrial enterprises. The vice-president, F. E. Kenaston, is president of the Minneapolis Threshing Machine Company, and is a man of wide mechanical experience. He is connected with several of the leading financial institutions of the Northwest. F. E. Starnes,

who takes up the general management of the new company, is also secretary and treasurer. Mr. Starnes is a young, energetic and keen business man.

The originator of the famous Minneapolis Two Speed, J. M. Michaelson, has been appointed chief engineer. Mr. Michaelson is a very thorough, competent and efficient man in this department and may be depended upon to make the most of the opportunities offered him through the reorganization of the company.

The general policy of the Minneapolis Motor Company will be to elevate the already high standard of the Minneapolis motorcycle and Minneapolis tri-cars, and to assume the most liberal policy possible towards dealers and riders.

In short, the company—backed by a capable organization and plenty of capital—will leave nothing undone to keep the Minneapolis machines in the front rank of American motorcycles, and its 1913 models will show a number of improvements of exceptional interest. Steps are already being taken to pave the way for prompt deliveries of the new machines, and there is every indication that they will enjoy a lively boom for the coming season.

equipped for his new berth. Pending the opening of the new building, temporary headquarters are being maintained at 257 Peachtree St.

VIM COMPANY'S PRESIDENT.

JOHN W. HENRY, president and treasurer of the Vim Cycle & Hardware Company, of Buffalo, N. Y., appears in the accompanying photograph. Mr. Henry heads a hustling organization which has done much to advance the interests of motorcycling and bicycling in its territory, and his versatility and boundless energy have been among the chief assets responsible for the upbuilding of a thriving business. The Vim company manufactures Vim bicycles, distributes Excelsior motorcycles, National bicycles and Vim tires and carries on a large jobbing trade in motorcycle and bicycle sundries. The company's territory consists of New York state, west and north of and including Cayuga, Cortland and

Tioga counties, Monroe county being excepted; also Pennsylvania, north and west of and including Tioga, Clinton, Cameron, Elk, Jefferson, Clarion, Benango and Mercer counties.

NEW BAXTER TYPE.

ANNOUNCEMENT is made by the Baxter Sidecar Co., of Cambridge, Mass., that it is preparing to market a new sidecar type particularly adapted for use with the new spring-frame Indian models for 1913.

BAKER'S LONG TRIP.

E. G. BAKER, one of the busiest long-distance motorcycle tourists in America, passed through New York recently en route to Philadelphia, from which point he will start back west with Indianapolis as his objective point. Mr. Baker is superintendent of the motorcycle tire department of the United States Tire Company's Indianapolis factory and indulges in track and road riding, principally for the purpose of testing tires and determining their efficiency under all sorts of conditions.

E. G. Baker.

HOLDEN'S FINE ESTABLISHMENT.

THE accompanying photograph shows an interior view of the new Boston (Mass.) store of George N. Holden, agent in that city and in Springfield for the Indian. The store, with its forty-foot frontage, is one of the most imposing in the country. It is seventy-four feet deep, which affords on the street floor and in the basement a total floor space of 5,920 feet.

The street floor is devoted to the display and sale of Indians, parts, accessories and motorcycle clothing. The cabinet shown at the right contains nearly 1,500 drawers, each of which has its quota of parts or accessories. So large and varied an assortment is carried that it has been found necessary to install a card system to keep tab on it. Leggings and clothing are on display in the show case occupying the center

of the store. The room in back of the glass partition is split and the right hand side given over to the storing of stock. At the left are two "rain vision" windows through one of which the cashier—but why dwell on that part of it. At the other window those in trouble receive assurances of speedy relief from the head of the service department. In this office also a record of every transaction is kept in fireproof files. A row of potted palms which unfortunately do not show in the photograph afford an effective and artistic screen at the rear of the show windows.

The basement is reached by a rear entrance and is divided by a wire partition. Two-thirds of the space is given over to one of the most completely equipped repair shops in the country, while the balance is devoted to the storage and uncrating of new machines.

HUDSON COUNTY HUSTLERS.

ONE of the busiest motorcycle establishments in Hudson County, New Jersey, is that presided over by Boller Bros., at Union Hill. The proprietors are enthusiastic riders, and much of the progress made by the Hudson County M. C. during the past season is credited to their activity. Albert Boller, president of the club, and Gottfried Hess, its secretary, made up the committee of arrangements for a highly successful outing held recently on Staten Island. One of the features of the program was a pig chase, and when the porker was finally caught it was left with a farmer on the Island to be fattened. On November 2 a bulletin was received to the effect that the pig was in trim for the table, and a big feast was spread at Hector McNeil's place in Union Hill. Plans are under way for organizing bowling teams among the riders, and the coming winter promises to be a busy one for the club.

In October President Boller, of the club, and Chief of Police William Clossey, of the famous Hudson County boulevard squad of motor cops, made a trip to the Indian factory in Springfield, Mass. The Bollers are agents for Indian and Excelsior machines in their district.

NO less than 208 riders participated in a recent hill-climbing program of the Liverpool (Eng.) Auto Cycle Club. The events held on private ground, drew hundreds of spectators.

HEARSEY-WILLIS CATALOG.

AS attractive a tire and rubber accessory catalog as has come to hand in some time is from the headquarters of the Hearsey-Willis Co., of Indianapolis. It is a 36-page booklet, well printed and illustrated, and deals instructively with the company's line of motorcycle grips, lagging, pedal rubbers, generator tubing, blow-out patches and other sundries for motorcycles, as well as for automobiles and bicycles.

TRIUMPH RECEIVER NAMED.

DETROIT, Mich.—The Security Trust Company has been appointed receiver for the Triumph Mfg. Co., manufacturers of Triumph motorcycles, on petition of three creditors, the Haverkern Contracting Co., Standard Electric Co. and the Sterlinger Co. The combined indebtedness to the three petitioners amounts to about \$2,000. The total liabilities of the Triumph Co. are \$62,000 and the assets are given as \$130,000.

The Haverkern company claims are for work done in remodelling the firm's plant at 51-55 Woodbridge street, and the Standard Electric Company's bill is for wiring the same, while the Sterlinger Co. has money due for furnishing parts for motorcycles.

According to the Security Trust Co., the business is in fairly good shape. The most valuable assets are parts for 2,000 motorcycles and there are orders on hand for 1,280 machines. It is deemed advisable to continue the manufacture of motorcycles and fill orders, in which event it is believed the creditors will soon be paid off in full. The machinery of the firm was secured on contract and hence cannot be converted into cash.

CHANGE OF NAME.

ANNOUNCEMENT is made by the manufacturers of the V-Ray spark plug, formerly known as the Marshalltown Motor Material Manufacturing Company, Inc., that papers have been filed with the secretary of the State of Iowa changing the firm name to the V-Ray Company, Inc. This announcement is accompanied by a statement to the effect that the company has increased its producing facilities five-fold. New machinery is being installed, and the working force has been enlarged. The company's products will be on exhibition at both the Madison Square Garden show, in New York, and at the Chicago show. At the latter place their giant 254-pound plugs will be shown in operation.

RUNNING DAY AND NIGHT.

THE steady pouring in of orders for 1913 Yales has made it necessary for the factory at Toledo to run day and night, the first night shift having been put on November 11.

Motorcycle Headquarters of Boller Bros., in Union Hill, N. J. These Agents are Active in Club Affairs as Well as in Trade Circles.

SETTING THE NEW BOSCH ZE1 MAGNETO

THIS magneto, the latest addition to the motorcycle line of Bosch goods, is of the true high tension type, in which the high-tension current is generated in the winding of the armature without the use of a separate coil, etc. A permanent magnetic field is formed by two powerful horseshoe steel magnets between the pole-pieces of which is rotated an I-shaped armature. This armature carries two windings, the *primary* consisting of a few turns of heavy wire, and the *secondary*, of many turns of fine wire. The secondary is a direct continuation of the primary winding. When the armature is rotated, a circuit-breaker interrupts the primary circuit, and a current of high intensity is produced in the secondary winding. This secondary or high-tension current passes to the slip-ring and is taken off by a carbon brush and cable to the spark plug.

The circuit-breaker is carried in a movable casing outside of the magneto, but attached thereto, and by moving the casing the timing of the ignition spark can be varied, either early or late, through a range of 30 degs. on the magneto or 60 degs. on the crank of the

motor. For each revolution of the armature but one spark is produced, and as a four-stroke single-cylinder motor requires but one spark per two revolutions, the armature is driven at half the speed of the crank-shaft, or at cam-shaft speed.

To set the magneto, the piston is to be brought up to the top dead-center on the compression stroke. This may be done by turning the motor over until the exhaust valve is just closed; then giving the crank-shaft one complete revolution, neither more nor less. The circuit-breaker casing of the magneto should then be turned so that the red mark that it bears is in line with a red mark on the circuit-breaker end-plate. The holding spring 174 is turned aside and the cover 173 removed, to get at the breaker, and the armature is then turned in the direction that it will be driven until the circuit-breaker lever is seen to remove or until the platinum points are in the act of separating.

With the armature held in that position the driving gears should be meshed, and great care should be exercised to prevent the armature and crank-shaft from moving with relation to each other.

With this setting, ignition occurs at top dead-center with the red marks in register, and an advance of 20 degs. is obtained with the spark control in fully-advanced position. The setting will also enable a spark to be produced after the piston has passed top center on the compression stroke, enabling slow running under a heavy load. The 20 deg. advance has been found to be sufficient for the average motorcycle motor.

Having timed the magneto, the spark-plug is next to be coupled up to the magneto. This is made as follows: Bonnet 62 over end-plate 51 is removed after taking out two screws immediately below the vulcanite brush-holder 56. This exposes the holder and its brush 59. Take out the small piercing screw 58, cut the end of the high-tension cable square and thrust it into the cable opening on the outside of 56 as far as it will go. Replace and screw home the piercing screw, which pierces and fastens the cable as shown in the second figure. The connection is perfect, but the cable must be 7 millimeters in diameter in order to fit the opening. This diameter is the regular size of cable used for this service.

Ignition is cut off by grounding or "short-circuiting" the primary circuit and can be done by either of the following methods:

1. By retarding the ignition to the most extreme point. In that position a flat spring attached to the binding post 170 in the circuit-breaker casing is in contact with a grounded pin on the magneto end-plate.

2. Binding post 170 may be connected to ground through a switch or button, one wire being taken from the binding post to the switch, where the operation of the switch or button establishes a circuit from the post through the wire, handlebar, frame and magneto, thus cutting off the ignition. When the switch is opened, the ground connection is broken and the magneto will generate.

A suggestion from our correspondent in London, where it is announced that further increases in gasoline rates may be expected.

DUCKWORTH PLANT.

IN the accompanying photograph is shown the enlarged plant of the Duckworth Chain & Manufacturing Company. A new wing was added recently, but despite the greatly increased facilities thus afforded the company finds it necessary to operate on a special schedule in order to meet the demands for the coming season. The rigid manufacturing and inspection system always associated with the Duckworth products is being admirably maintained in the face of unprecedented demands, and the 1913 season promises to enhance still further the reputation of the company's chains. The factory now has an added floor area of 7,500 square feet.

It will be noted that special care has been exercised in laying out the factory and grounds, and this spirit has been carried by the company throughout the entire establishment. Systematic handling of raw material, as well as the finished products accounts for much of the firm's success, and by fostering co-operation among its employees the company has obtained truly remarkable results in this direction. With the greatly increased floor space embraced in the recently completed addition it is estimated that the output will be at least doubled for 1913.

PIERCE PLANS

Former President Percy P. Pierce Will Form \$250,000 Company to Take Over Assets of Pierce Cycle Co.

BUFFALO, N. Y., November 12.—Within the past few days the plans of The Pierce Cycle Company have taken definite form. Percy P. Pierce, former president of the concern, has gone into the company and it is understood that he will ultimately take entire charge of affairs. Mr. Pierce is forming a \$250,000 company, to take over the assets and good will of The Pierce Cycle Company, which he has already bought from the present owners. In the meantime the factory is being operated in all departments to about one-half its normal capacity. Parts, repairs, new bicycles and motorcycles are being delivered daily. Raw material, equipment, etc., is being bought constantly, and production will continue without the slightest interruption, or hold-up in deliveries. All special quotations previously made on bicycles, motorcycles or parts were cancelled on and after November 7. The prices applying on machines are those contained in 1912 contracts.

Fortunately for the new management, Mr. Hancock, as trustee, made arrangements for 1913 models several months ago. The plans previously made will go into effect immediately. There are a number of changes and

improvements projected. A complete announcement of 1913 models will be given within two weeks. At present it can be stated that the line will include improved single-cylinder and four-cylinder models, and it is predicted that a twin model will also be added, which will give the Pierce people the unique distinction of being the only makers of singles, twins and fours.

Sales Manager W. A. Johnson is now on a business trip to the Pacific Coast, during which he will touch at all the larger cities.

CLEVELAND, Ohio.—The Auto Mart Company has been incorporated with a capital stock of \$10,000, to deal in and rent motorcycles, and deal in supplies of all kinds. The incorporators are Edward C. Plietz, W. G. Radcliffe, William H. Hasselman, William R. Wallace and Louis C. Heimberger.

HARRY D. IMMEL, of 5645 Penn avenue, Pittsburgh, Pa., best known as "winner of the Cleveland-Pittsburgh Road Race," is about to open a shop where he will handle the 1913 Excelsior, Triumph and Henderson, together with a stock of motorcycle sundries and parts.

ALWAYS abreast of the times, B. A. Swenson, Providence (R. I.) agent for Indian machines, posted baseball bulletins in the window of his establishment during the recent world series and thereby drew large crowds.

SABO MOTORCYCLE LOCK.

COMBINING sturdiness, extreme simplicity and effectiveness, the Sabo motorcycle lock, produced by the Sabo Mfg. Co., 3110 West Twenty-fifth street, Cleveland, Ohio, is a fitment that has grown rapidly in favor wherever it has been demonstrated. It locks the stand to the frame—in the down position—and as a result it is impossible to roll the machine or push it. There are no chains to be cut by pliers, and it is impossible to break spokes or the drive chain by absently pushing the machine off the stand, as might be done with some other types of locks that extend through the wheel. The company has designed locks suitable for all Indian models, 1912-13 Harley-Davidson types and Excelsior, Thor and Flanders machines.

WHOOPIING UP SALES.

THE Chicago Cycle & Supply Company is making elaborate preparations for 1913. The company now has six men, carrying a complete line of samples, traveling through the West, Middle West and South. It has also secured large space for the Chicago Show and will display a full line of accessories. An instructive and attractive catalog will be sent to dealers on request.

HARRISON SHOOK is making a motorcycle trip from his home in Chippewa Falls, Wis., to the Gulf Coast. He is in the employ of a publishing company.

Some Timely and Distinctive Equipment Pointers for the All-Year Motorcyclist.

Members of the Los Angeles M. C. "Annex." Coasting on the Banking of the Famous Mile Saucer at Playa del Rey.

A Scene near the Judges' Stand at the Los Angeles Track after the Recent Blue Ribbon Races. It will be noted that the fair enthusiasts are still in the limelight, and that they are attired in keeping with their surroundings. The Stadium races have been well attended so far this season, and enthusiasm runs very high.

A BRITISH TRIBUTE.

DISCUSSING motorcycle stroke and bore ratios in *The Motor*, of London, a contributor pays a tribute to the excellence of design of the Hedstrom motor, used exclusively on Indian motorcycles, in the following words:

"The 5 h. Indian engine is so different, and, in my opinion, in many ways superior to English engines, that I hardly care to rely on its performances as evidence one way or the other."

The bore and stroke respectively of the Indian 5 now discontinued was $2\frac{3}{4} \times 3\frac{3}{4}$ inches, giving a stroke and bore ratio of 1.3 to 1.1, while the Indian 7, with cylinders $3\frac{1}{4} \times 3\frac{43}{64}$, has 2.2 to 1.95 stroke to bore relationship.

JOHNSON IS RETAINED.

ANNOUNCEMENT is made that the Pierce Cycle Company is laying plans for the continuance of its business on even a larger scale than in the past, and dealers and riders are assured that the high standard of the company's products, established through years of expert designing and conscientious manufacturing, will be maintained in future models. W. A. Johnson has been retained as sales manager for the company.

BRIEF AND TO THE POINT.

"**W**E are distributing Yale machines for New York, Westchester, Richmond, Kings, Queens, Rockland, Putnam, Orange, Dutchess, Ulster, Nassau and Suffolk counties," writes the Gotham Motor Co., of 92-98 St. Nicholas avenue, New York, "and we are on the scout for live 1913 agents."

PITTSBURGH DEALERS.

THE Motorcycle Exchange, 5606 Penn avenue, will again handle the Indian exclusively, acting as distributors for Allegheny County.

Harry L. Neff, of 106 Federal street, will continue to handle Thor and Merkel machines, as well as bicycles and a general line of sporting goods.

A LETTER ON SADDLE-BAGS.

THEODORE J. WERLE, traveling lecturer for the Wisconsin Anti-Tuberculosis Association, has written an interesting letter relative to his method of solving the luggage problem. He uses one of the Harley-Davidson carriers, designed primarily to meet the requirements of R. F. D. riders, and finds that he is able to carry a remarkable assortment of luggage without undue annoyance or strain upon his machine. Werle is using the first carrier of this type turned out from the Harley-Davidson factory, by the way. The lecturer writes as follows:

"Let us say that you want to go on a trip and carry your outfit with you. The saddle-bags as fitted on the H.-D. carrier, will hold all of your personal belongings, and will keep clothes perfectly dry and clean. In my saddle-bags I carry one extra suit of underwear, one extra pair of breeches, six pairs of sox, an extra shirt and a dozen clean handkerchiefs, besides a set of military brushes, a safety razor, a mirror, and a few magazines with which I fill in the time between darkness and bed by the light of my headlamp. The bags also hold for me one three-pound blanket, one mosquito hood, a slicker coat and hat, a hunter's ax, five or six straps, an extra inner tube, a number of pamphlets, my road maps and any other miscellaneous things I may pick up along the road.

"The value of the saddle-bags, however, does not end with their generous capacity. At night one serves as a pillow, while in the other I place my watch, money and other valuables for safe keeping. By sitting on one and taking the other on my lap I have a perfect writing table. While I am not using them that way, they sometimes take the place of my washstand and shaving table. They also make a perfect dining table, because I can stick my legs through between them while sitting on the ground.

"In my work it is often necessary for me to have a sort of counter to pile reading matter upon; for this also my new Harley-Davidson carrier is well adapted. At other times I need a stand upon which to set my stereopticon during lectures and here again I use

my luggage carrier. Only the other day I needed a platform from which to speak to an audience and I could have found nothing better than my luggage-carrier. Many times friends come to visit me while I have my tent pitched in some small town, and the only seat I can offer them in my parlor is the luggage-carrier on my machine. So important has my carrier come to be that I can safely say my machine would be practically useless to me without it."

AGENCY CHANGES.

A RECENT announcement from the Bal-four Hardware Company, of Savannah, is to the effect that they will concentrate their efforts on the sales of Harley-Davidson and the Henderson machines for 1913.

R. R. Oakman, formerly Merkel agent in Savannah, will during the coming year handle Indian, Pope and probably Yale machines. For the past four or five years Indian interests in Savannah have been taken care of by the Harris Tire Company, which will henceforth devote its efforts to the advancement of the DeLuxe. It is also rumored that they will act in behalf of the Excelsior.

GOODYEAR CONTEST.

WITH a view of assisting dealers in general and to obtain first-hand data for its Dealers' Service Bureau, the Goodyear Tire & Rubber Co. recently offered a prize of \$10 for the best letter giving the story of an actual experience with local advertising. It is the aim of the bureau to ascertain the methods which have been found most successful by local dealers, and to assist them in mapping out new campaigns. Aside from the first prize the company announces that five dollars will be paid for each letter considered interesting enough to appear in print. The competition is open to all dealers.

AUTOMOBILE and motorcycle races were held in connection with the Belmont County Fair, at Philadelphia, October 20.

T

THE accompanying photographs, showing interesting scenes in Vancouver, B. C., are forwarded by James F. Cameron, of Lebanon, Tenn., who toured that country last Spring. No. 1, a typical road scene; 2, a halt for refreshments at Nanaimo; 3, hard going in sand; 4, a Vancouver regiment on the march; 5, a broken pedal being repaired under difficulties.

Bulletin

Telegram just received:

"Yellow Pup" won every heat and race entered except one at Motordrome.—Hans Johnsen, Dallas, Texas.

At Seattle, Wash.: Fred Mercier won the big 10 miles free-for-all and broke all dirt track records, afterwards defeating racing auto in match race. Hagger (also Flying Merkel) won other two open races, defeating special machines.

One-quarter the United States closed last week; did you wire for territory?

MIAMI CYCLE & MFG. CO., 300 Hanover St., Middletown, Ohio

CLARK TANK BRACKETS.

RIDERS who have had trouble with acetylene tanks due to their constant shifting and shaking, will be interested in knowing of an extremely efficient bracket, which is now being marketed by the W. F. Clark Mfg. Co., 3551 W. 23rd street, Chicago. This bracket is made in two models, model "A" being designed especially for Excelsior Auto-Cycles, permitting of the tank's adjustment on the handle bars, while model "B" is for those who prefer the tank attached to the top cross bar of the motorcycle frame. Distinctive features

of the Clark brackets are extreme rigidity, a flaring base which rests lightly on the gasoline tank, preventing the acetylene tank from jarring the base on the roughest roads, and ease and quickness of attaching.

"MADE IN MINNEAPOLIS."

MINNEAPOLIS, Minn.—For some time past merchants and manufacturers of Minneapolis, Minn., have been planning to hold a combined exhibition of all articles manufactured in the city, in order that the inhabitants might fully realize the extent of local industries, and this determination led to a "Made-in-Minneapolis-Week," from Monday, October 28, to Saturday, November 2.

Needless to say, the Minneapolis Motorcycle Company was among the leading exhibitors. The firm displayed one of its light delivery tricars with an operator in livery astride the machine. This outfit is used to a large extent by the local merchants and has given perfect satisfaction. Among the other models displayed was the two-speed "Big Five."

The New Recruit—"There's nothing like a lock to protect a motorcycle, but when a guy leaves a fine kit of tools right on the machine what does a lock amount to?"

A BULLETIN FROM GALE.

"PIKE'S peak or Bust."—It certainly would have been 'bust' for us were it not for Weed Anti-Skid Chains," cheerfully postcards Mr. M. E. Gale to F. E. Sparks, 1430 Michigan avenue, Chicago, western distributor for Weed

chains. Mr. Gale and his wife are that much talked-of couple who are taking a little jaunt from Angola, N. Y., to California and return. The accompanying photograph typifies the usual road conditions encountered, with Pike's Peak in the background.

The Gale Outfit within sight of Pike's Peak.

MASON RESIGNS.

M. E. MASON, widely known in tire circles, has resigned as assistant district manager for the central district of the United States Tire Co. Mr. Mason was for sixteen years in the employ of Morgan & Wright; from 1897 to 1903 he was manager of the company's bicycle department, and in charge of the carriage tire business. During the last year Mr. Mason has devoted most of his time to the selling end of the solid motor tire and pneumatic automobile tire departments, in which he maintained his reputation for result-getting. His plans for the future are at present indefinite.

HEDSTROM "COMES BACK."

ELECTION DAY was a novel occasion for Oscar Hedstrom, of The Hendee Manufacturing Company, for he cast his first vote in twenty years. This very moderate exercise of franchise privileges was not due to indifference, as he frequently registered, but usually was at some race meet in another city on the first Tuesday in November. This year the Wigwamite was in a position to cast his vote, and his enthusiasm made up for lost time.

Motorcycle Valve Stems

get the hardest use of any
gas engine valve. The prob-
lem is to make them so they
will not break or burn up.

By using the toughest steel,
properly heat treated, we
overcome the breaking, and
by welding a cast iron seat
to the head we eliminate the
pitting, burning and warping.

Long service in the most pop-
ular machines has proven
these things.

If you are not using them,
will you go into the matter
with us?

Brown Scientific Non - Deflating Pneumatic Tube

**AN AIR FILLED MOTORCYCLE TUBE POSSESSING
VERY UNUSUAL FEATURES:**

First: It withstands a tread puncture without de-
flating the tube.

Second: The higher the pressure the tighter the
puncture closes.

Third: It eliminates the risk of destroying cas-
ings by reason of punctures.

Fourth: The danger of loss of control of machine
is removed.

Fifth: It assures you of not being obliged to re-
pair a puncture on the road and gets you "there and
back" on full tires.

AIR FILLED ONLY

Punctures are self-closing by reason of a scientific
but simple principle of construction.

**NO "DOPE," GUM, PASTE OR OTHER
STUFFING MATERIALS.**

ANNOUNCEMENT

A Motorcycle Coaster Brake That Is Strong Enough to Hold an Automobile

For some time past the motorcycle trade has felt the need of a coaster and braking device of sufficient power, strength and efficiency to give the rider control of high-powered machines.

The 1913 New Departure will do this and then some. It doesn't require much effort by the average rider to exert a back-peddalling pressure of 75 pounds. In this new model such a pressure will give A BRAKING FORCE OF

MODEL L
1913 New Departure Motorcycle
Coaster Brake for Belt Drive Machines

ONE AND ONE HALF TONS in the rear hub—a power sufficient to stop an automobile.

The action is positive. There is no possibility of locking. The mechanism is heavy—stronger than necessary.

Every motorcycle expert who has seen it says it is the ideal brake—just what rider and manufacturer have been waiting for. Fully described in new catalog, send for your copy today.

MODEL LL

Coaster Brake for Chain Drive Machines

The New Departure Mfg. Co., Bristol, Conn.

COASTER BRAKE LICENSORS

POWER That's what converts the sport from work into pleasure. The Eagle soars high above the less powerful machines. A careful study of the power chart shows why. The Plenty of It gasoline does something when used in the Eagle. Perfect valve action made possible with the profile cam gives that even explosion, uniform power, and high torque at low speed. The great power of

The Eagle "9"

gives all the speed you want without fuss with a quarter throttle on level roads, and half open, climbs most any hill. You don't feel as if it was tearing itself to pieces. You know while riding that the easy jog of the motor insures long life to the whole machine.

AGENTS—Don't be misled. Power is what the boys want and ought to have.

Write for 1913 agency proposition.

We Want the Chain!

Never before in the history of motorcycling has the demand been so strong, so consistent, so universal, for the CHAIN DRIVE as it is to-day. And never before have the leading manufacturers so completely capitulated to this demand.

Read their announcements. See for yourself the practically unanimous adoption of the chain drive as the TRANSMISSION FOR 1913.

In particular, read the INDIAN announcement. Thirty-five thousand chain-driven motorcycles for 1913!

"DUCKWORTH"

chains are used by all the leading motorcycle manufacturers, because they are unequalled in quality and efficiency.

This picture shows the completed plant of the Duckworth Chain and Mfg. Co. The large addition at the left has a floor area of 7,500 sq. ft. and its erection was an imperative necessity to assist in increasing the output of "Duckworth" chains. This is certainly one of the many indications of the public's preference for the chain transmission in general, and Duckworth chains in particular.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

Economical tire buying is simple—all there is to it is to see that you get the *most* in service and satisfaction.

Almost any tire will give ordinary service, but ability to deliver maximum mileage has a vital bearing on ultimate cost.

Shrewd motorcyclists find that the matter of satisfactory tire service hinges entirely on tire quality.

Discriminating in the selection of tires is real economy—it results in longer wear without added cost.

FEDERAL TIRES

The Tires of "Extra Service"

Federal Tires are the kind that last a long time—durability is the leading feature about them. They are extremely well made of the finest and most carefully selected materials. Every Federal Tire has *extra* service built into it. For the sake of comparison, try them.

Federal Tires are made in Corrugated and Studded treads in all sizes and in single and double clinch types. They are supplied through leading dealers everywhere. Interesting tire book mailed on request.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing. The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

Snow and Ice Mean Double the Wear on Tires

That is one of the reasons why

Diamond MOTORCYCLE TIRES

should be your equipment
for winter.

Your safety often depends on
your tires. Treacherous snow
and ice can cause a disas-
trous skid if the tread on
your tire will not prevent it.

Ice and frozen mud will tear
a tire to pieces if it is not
of extreme toughness.

All the strength necessary
to meet such conditions is
built into Diamond Motor-
cycle tires.

You can buy cheaper tires
than Diamond tires but you
cannot buy better ones.

The *Neverout* Gas Lighting TRADE MARK Outfit FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS

THEY WILL SETTLE THE RIM PROBLEM FOR ALL TIME

Let Us Send You This Sight Glass Oil Gauge

—AT OUR EXPENSE—

Mr. Harley-Davidson rider! Mr. Excelsior rider, and all the other riders that have no oil gauge on the crankcase of their engine! We have so much faith in our oil glass that we wish to send it to you at our expense so that you can see it yourself—and then you can decide whether you want one or not. We want you to see the finest crankcase gauge ever put on a motorcycle, a gauge that will show you EXACTLY how much oil you have in your engine ALL THE TIME, and will do what no other one will—IT WILL KEEP CLEAN.

The Gauge is handsomely nickel plated, an ornament to any machine, the size of a thin watch, only $\frac{3}{8}$ of an inch thick. It screws firmly on the crankcase, is out of the way and won't jar or get knocked off. It will save its cost in oil in a few weeks. It will keep your plugs from fouling. After you have used it a week you would as soon be without your watch. It can be attached in ten minutes with the tools furnished. Do you know that if you have the right amount of oil in your engine you can start easily in the coldest weather?

We Have Lots of Letters Like This

THE BUCK SALES COMPANY, 211 N. 12th Street, St. Louis.

Gentlemen:—I am pleased to say that your Simplex Oil Gauge is giving splendid results on my Excelsior 7-horsepower twin, as it shows the oil level at all times and prevents overoiling and fouling plugs. A careful rider should not be without one. Very truly yours, H. C. BROADWELL, Security Bldg., St. Louis.

BUCK SALES COMPANY, 211 North 12th Street, ST. LOUIS, MO.

The Buck Sales Company, 211 North 12th Street, St. Louis, Mo.
Gentlemen: Please send me, without charge or obligation on my part, one of your Simplex oil gauges for.....
Motorcycle. If I decide to keep it I will pay the regular price, \$1.50, without cost to me.

"We have used Diamond Chains exclusively for starting chains on the Wagner Motorcyclo for the past six years. Always most satisfactory."

Testimony like this from such a well-known firm as the Wagner Motorcycle Co. should be more convincing than all we can say about the high grade material and exceptional machining that goes into every part of a Diamond Chain.

Twenty-one years of supremacy makes Diamond Chains worth all the praise they get. Look for the Diamond trade mark on the connecting link when you buy a new chain.

Keep your feet always on the Pedals

The deep rubber corrugations in the big cushions on

STANDARD PEDALS

keep the feet in the proper position. When going over rough roads, the constant jarring and bumping makes it very uncomfortable for the rider who cannot make his feet stay "put"—not to mention the fact that he cannot readily use his brake.

STANDARD PEDALS insure the utmost comfort for the feet. They have been in consistent use by the majority of motorcycle manufacturers for many years, and you can have them on your motorcycle if you insist on Standard Pedals.

Dealers—send for electrotypes and description of our line. It is well worth handling.

THE STANDARD COMPANY
TORRINGTON, CONN.

Jeffery-Dewitt Porcelain Triumphs Again

¶ It takes a hammer to crack a J-D Porcelain. Heat can't do it. Every claim to the superiority of this product has been vindicated—and more—by a new experience. A great motor car factory burned to the ground on the first day of last June. It was the fiercest conflagration ever recorded in the automobile industry. Heavy brick walls crumbled like cardboard; steel rails twisted and curled like glowing serpents along the ground; immense steel girders bent and writhed in the flame; piles of aluminum castings melted into a white hot pool. When the fire had burned itself out, nothing remained but the smoking wreckage of a plant and stock worth half a million.

¶ Workmen started in to sort out the junk. Twenty-seven cars ready for shipment had been standing on one of the floors. Their scarred skeletons were found deep in the wreckage, where the flames had been hottest.

¶ Every motor had been equipped with J-D Spark Plugs. Not a single Porcelain was cracked!

¶ The case-hardened steel of the plugs had no more temper left in it than a piece of putty. The brass caps were melted off. But not a porcelain had suffered a bit of damage, beyond having the enameled lettering half burned away, as is shown in the photograph.

¶ This same quality of porcelain enters into every spark plug produced by the Jeffery-Dewitt Company. When you buy spark plugs again buy the best—the J-D line—the kind that defy heat, besides being carbon proof, soot proof, oil proof. Satisfaction guaranteed or your money back.

¶ Write for our motorists' classic: "Ignition and Spark Plug Talk." It's full of good pointers and timely information. A new edition is just off the press.

The Popularity of the
**CORBIN MOTORCYCLE
BAND BRAKE**

☐ This is fully attested by the fact that so many motorcycle manufacturers are equipping this brake to their 1913 models.

☐ Over one-half of all the motorcycles that will be manufactured in America during 1913 will be Corbin equipped.

☐ The Corbin is the brake that motorcycle manufacturers take pleasure in announcing in their catalogs. It is the one brake that holds the full confidence of motorcycle riders.

☐ Send for new 1913 catalog describing all the models of Corbin Brakes and Hubs.

The Corbin Screw Corporation Division

(THE AMERICAN HARDWARE CORPORATION)

New Britain, Connecticut

Licensed Coaster Brake Manufacturers

Western Office, 65 West Lake St., Chicago, Ill.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing. The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

The ONLY Practical Light for Motorcycles

The rider who stays close at home for fear he will not get back before dark, misses half the joy of motorcycling.

Night riding in safety is made both possible and pleasant by the use of a large enough lamp and a **RELIABLE** source of brilliant light.

The Prest-O-Lite Gas Tank is the **ONLY** lighting equipment that meets these needs.

A gas generator, besides being a troublesome nuisance, is not reliable. Small generator lamps are too feeble.

Prest-O-Lite floods the road far ahead with brilliant light—shows up the bumps, ruts and puddles.

The flame neither flares up nor dies down—it is **STEADY** under all conditions. Turned on and off like a gas jet.

Prest-O-Lite Owners

Paul C. Stallpomp, 205 West First St., Delphos, Indiana, finds his Prest-O-Lite Motorcycle makes night riding pleasant and safe. It is the light that never fails.

Prest-O-Lite Motorcycle Gas Tank

Exchange service wherever you may be is provided by over 20,000 dealers (motorcycle and automobile). We will arrange prompt service for anyone, anywhere.

You Can Easily Afford It

Prest-O-Lite service costs no more—usually costs less—than the carbide a generator consumes.

Price of Tank \$10

(Equipped with Gauge)

Dimensions: Length, 13¼ inches; diameter, 4 inches; weight, 8¾ pounds. 40 hours of light. Easily attached to any motorcycle.

The money you invest in the tank itself is not **SPENT**, because a genuine Prest-O-Lite Tank never gets to be second-hand, is always in demand, and is always a **READY CASH ASSET**.

In fact, no rider can afford to be without this combined **CONVENIENCE**, **PLEASURE** and **INSURANCE**. One accident due to poor light might cost you more than years of Prest-O-Lite service.

Don't Let Anyone Cheat You With an Imitation

The genuine Prest-O-Lite Tank, when empty, can be immediately exchanged for a full one, **ANYWHERE** and **ALWAYS**. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite Tank gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us. Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Read the label.

The Prest-O-Lite Co. 246 E. South St. INDIANAPOLIS, IND.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

M.. Dealer: In this one ad alone there are plenty of reasons why you ought to be pushing the Prest-O-Lite Tank, for your customer's sake as well as your own.

And, if you want to retain your customer's trade on other things, don't get him into the habit of going elsewhere for his Prest-O-Lite exchange.

We're Still Laughing !

BUT, MIXED WITH THIS huge amusement is a fair share of amazement at the policy adopted by belt manufacturers in their desperate efforts to retain their fast "slipping" grip on the transmission business in America. By attacking the chain transmission they have laid themselves open to retaliation.

THE BELT IS A remnant of the dark ages of motorcycling—when the general unreliability of the machine itself dwarfed into practical insignificance the poor work of the belt. But, under the glaring noonday light of mechanical perfection which the motorcycle of today has attained, the belt's faults have been mercilessly exposed. Its constant stretching when under strain, the necessity of aids of various kinds, its general all-around inadequacy has done a great deal to annul the gigantic strides made by the motorcycle toward absolute mechanical perfection.

THE BELT IS NOT a good transmission because it is unreliable. It slips at a critical moment. It is not prepared to withstand an excessive strain. On hills, the friction caused by the belt's slippage frequently forces the rider to stop in order to permit the belt pulley to cool off. So terrific is the heat occasioned by this friction that oftentimes the "dressing" begins to bubble and the belt literally "fries" in oil.

TO MAINTAIN EVEN ITS low standard of efficiency, the belt requires aids of various kinds, as, for instance, "pulley lagging," which is a strip of adhesive tape which must be wrapped around the pulley and which must be renewed every so often. Even the veriest novice can appreciate how radically wrong is the idler—what excessive friction is occasioned when the idler is employed.

WHEN THE BELT IS exposed to water, it softens and the small stones, grit, gravel, etc., thrown up by the tires imbed themselves in the belt. After the belt dries, it hardens, loses practically all its flexibility and the foreign particles remain therein, frequently severely scoring both the pulley and the belt rim on the rear wheel.

EXCUSE US A MINUTE—we have to laugh again. Picture to yourself a rider discarding a transmission for the sole reason that lubricating it gets his hands dirty. Of course the average rider of a motorcycle wears white kid gloves and just positively hates to get them soiled!

YOU'LL NOTICE WE ARE not saying anything about the chain. We don't have to. The strongest argument that can possibly be put forth is the fact that the engineering experience, brains, acute mechanical knowledge and farsightedness of the leading motorcycle manufacturers of America and abroad have decreed the chain to be the transmission best fitted to do justice to their output. While it is true that the rider's wishes are to be considered, it seems to us that the decision of men trained to recognize and seize upon what is mechanically correct should hold stronger weight with the rider and prospective rider than the claims and protestations of manufacturers whose opinions are **very much** biased.

Ha! Ha!

Sarco Engineering Co. 116 Broad St., N. Y.

U. S. Agents for "The Coventry" Chains

These Links are in all "The Coventry" Chains

Built into every one of "The Coventry" Chains are the three qualities which have made them famous—

Strength

"The Coventry" Chains must withstand an actual strain equal to 3600 pounds before they leave the factory. No strain put upon them by any motorcycle motor—no matter how powerful—can make them break or give in any way.

Speed

"The Coventry" Chains have been the standard equipment of the majority of victorious European riders. Twice in succession they won the Tourist Trophy races in England—the Circuit de Fontainebleau in France and other notable events.

Endurance

This can be gained only by conscientious manufacturing methods and rigid inspections. In "The Coventry" Plant, not one of the 1200 operations each chain undergoes is passed without a close inspection. The carefully selected bar and strip steel, the perfectly tempered bronze bushings—all are combined in making "the chain with the nose" a triumph of the chain maker's art—the ultimate aim of which is PERFECT SERVICE.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

**Continental-
Erie
Tires**

**"They're
Built
to Last"**

LIFE!

THE tire that gives the longest **efficient** service is the tire for **you**. Continental-Erie tires are made in but one tread—the studded—and the attention which would otherwise be divided among different molds is concentrated on the perfection of the studded tread. Years of experience have taught us the superiority of the studded tread for hard service. The studs grip the road and only when they're entirely worn off does the actual wear on the tire begin.

Add carefully selected, high grade materials and conscientious, concentrated manufacturing methods to the undoubted advantages of the studded tread, and you have the **ideal** tire in point of **efficient service**—the Continental-Erie.

THE POWERFUL

QUICK IGNITION

DIRECT THRUST

POSITIVE EXHAUST

Pope
"Big 4"

Why Mechanically Operated
OVERHEAD VALVES

Produce More Power

The chief advantages of overhead valves in a motorcycle engine of the Pope "Big 4" type are quick ignition, direct thrust, and positive exhaust. Great power and efficiency are the logical results.

QUICK IGNITION Ignition is quick in the Pope "Big 4" engine, as it always is in a properly designed motor with overhead valves. This is because the gas is admitted directly to the compression chamber without turning any corners as it does in an "L" or a "T" shaped cylinder. The spark fires directly into the mixture as it enters.

DIRECT THRUST When the explosion occurs the power impulse coming with full force directly down on the piston from above produces what is known as a "direct thrust." No energy is lost as there is when the explosion occurs offside.

POSITIVE EXHAUST The exhaust stroke is positive in a Pope "Big 4" motor and the scavenging of the cylinder is complete. After the explosion, all burnt gases are expelled from the cylinder immediately. There are no pockets to sidetrack the exhaust or collect carbon. The cylinder walls present an unbroken surface.

ACCESSIBILITY The overhead valves of the Pope "Big 4" are located in the most accessible place.

SILENCE and

That form of transmission which runs day after day, without sound, best fulfills its mission in popularizing the motorcycle; that form in which the construction is simplest, and the repair, when necessary, most readily and rapidly effected without complicated parts, appeals to the present and prospective rider as the most desirable.

Silence

Two sounds, one pleasant and the other unpleasant, are inseparable from the operation of a motorcycle. These are: the noise of the tire on the road and the puff of the motor exhaust. The ideal motorcycle should run with no other sounds than these. Least of all should the transmission be noisy. There should be no whirr, rattle or clank evident; the drive should be essentially silent. With the belt-driven motorcycle alone is this true.

The belt, running over its pulleys, is silent. A flat belt is endless, and there are no metallic parts to strike and click. A V-belt may have a metallic coupling, but it does not strike the pulleys, and this form is equally silent.

A chain transmission, made up of numerous links and often working over badly worn sprockets, sets up a whirr or clank, deepening in intensity as wear occurs. If too slack, a chain slaps about, making further noise. For a quiet transmission, it is not to be compared with the belt.

An unusual note in the running of the machine betokens trouble. The more silent the transmission, the more readily can such a warning be detected. If the transmission is noisy, the danger note must be of greater intensity to be heard at all. If not heard, it is neglected. The result in either case is costly and often disastrous.

THE GRATON & KNIGHT

LEATHER TANNERS

Worcester,

Manufacturers of the famous **SPARTAN BELTS** efficient and economical, the

SIMPLICITY

Simplicity

Absence of complicated parts is most desirable in any motorcycle transmission. If all riders were skilled tool-makers or mechanical experts, the fitting of small parts of unusual shape or the trueing up of members that are out of line would be second-nature. Such riders being the exception, however, the transmission simplest in its composition and up-keep is the most popular and best adapted to riders. Absence of complicated parts is a feature of the belt drive. This is lacking in other forms of transmission which are therein inferior.

A belt transmission consists of two pulleys, a belt and perhaps a coupling or idler. When necessary a belt is lubricated by applying a solid dressing while it is running. When it stretches, the rear wheel is adjusted to take up the increase in length, or the coupling itself will take care of this. On a flat belt, the idler need only be set up a trifle more. **The belt fits its pulleys.**

A chain transmission consists of two sprockets and a chain with one or more coupling links. The chain is made up of a number of links, each consisting of two rollers, two bushings, two pins or rivets and two side-plates. The coupling links have the side-plates and a special locking device, small and easily broken. The lubrication of a chain is a complicated process. When the chain stretches it no longer fits the sprockets. It is then necessary to remove it

and insert the special couplings, a dirty process and one requiring considerable skill. These spare parts must be carried, or the transmission will be disabled, and the machine rendered inoperative.

The care of a belt under all conditions of service involves but a minimum of skill, time and labor.

On the score of silence, and likewise simplicity, the superiority of the belt is very evident.

"A DOLLAR IN THE LOCK IS WORTH FIFTY IN THE REWARD"

"Motorcyclist's Book of Proverbs"

¶ Keep your name off the list of "Stolen Motorcycles." Almost daily you see mention of another machine stolen. Laws against motorcycle thieves are weak and the only way to thoroughly protect yourself is by locking your machine so it cannot be moved except by YOU—and the only lock that prevents machine being moved and that cannot be picked, pried or cut, is the "SABO."

¶ You can safely leave your motorcycle anywhere if you have a Sabo lock. It fits tight to the frame—cannot be pried off—there are no chains to be cut by pliers. You've got the goat of every motorcycling "Jimmy Valentine" that wants a ride on your gasoline. The lock is scarcely noticeable. The would-be thief will perhaps not see it; will walk up to the machine acting as if it were his own. But when he tries to move it from the stand he'll learn "Sabo's on the Job."

It's made of bronze metal, neat, simple, strong—fits your smallest pocket—lasts forever. The stand is locked securely to the frame—the machine cannot be moved while the lock is there—no danger of breaking spokes or chain by forgetting the lock and pushing machine from stand. It is impossible to wheel or ride the machine away.

¶ We prefer to have you buy from your dealer, but, if he does not have it, send this order blank with a dollar and the lock will come back to you, satisfaction guaranteed, prepaid, by return mail.

JOBBERS

List this in your 1913 Catalog. Cuts, literature and advertising matter furnished. Write for proposition.

EXHIBITORS IN CHICAGO SHOW

Long List of Representative Manufacturers is Now in Hands of Committee and Applications Still Coming in Necessitate Option on Another Section of 800 Square Feet.—Advertising Campaign is Now in Full Swing and Floor Plans Will Soon Be Ready.

CHICAGO, November 25.—As plans for the independent Motorcycle Show develop, it is increasingly evident that the exhibition is due to mark an epoch in motorcycling, for the enthusiasm with which manufacturers and jobbers have entered their applications for space is without precedent in this field. Because of the unexpected deluge of applications the Show Committee has found it necessary to apportion space on a sliding schedule, the exhibitors not being allotted the full area specified in their communications, and in some cases this has caused dissatisfaction. It is argued, however, that it is more reasonable to reduce the space of several dozen firms than to completely shut out a few prospective exhibitors, as would be necessary if all the applicants were allowed the space they desired.

Another Option Taken.

In general, the exhibitors have admitted the necessity for the action of the Show Committee and all concerned are pulling together like Trojans for the success of the enterprise. Since the last allotments were made by the committee a number of applications have been received and the committeemen have obtained an option on an additional section of 800 square feet. Even with this extension of the show space it is not likely that all the demands of late-comers can be met, and the committee advises manufacturers to file their applications at once.

Show Is Well Advertised.

Announcement is made that large posters advertising the show will be ready for mailing to every motorcycle dealer in the country about December 1. No less than 81,000 envelope stickers have been printed, and the committee took up the task of mailing them to exhibitors on November 25, so that their use on all outgoing mail may advertise the coming show from coast to coast. All in all, the show is being advertised most effectively, the publicity it has already received being much more potent, in the opinion of experts, than that obtained in other years when the motorcycles were overshadowed by the motor cars at the National Automobile Show.

No Space No. 13 on Floor Plan.

Floor plans, showing just where each exhibit is located, will be forwarded to the exhibitors on or about December 15 and it goes without saying that all contracts for space must be on file before that date. It is worthy of note that there is no space numbered 13. Prospective exhibitors showed a disposition to give this number the "go-by" and the Show Committee simply

eliminated it from the schedule. In referring to the matter one of the largest exhibitors said laughingly: "We don't intend to have even the suggestion of a hoodoo about this exhibition, and while I have no personal objections to the number 13, it doesn't hurt my feelings a bit to see it wiped off the floor map. We can get along without it."

The List of Show Exhibitors.

The list of exhibitors to date is given as follows:

Pope Mfg. Co., Hartford, Conn.; Flanders Mfg. Co., Pontiac, Mich.; Chicago Cycle Supply Co., Chicago, Ill.; Bosch Magneto Co., New York City; H. & F. Mesinger Mfg. GOOD ROADS MEETING.

COLUMBUS, Ohio.—At a meeting of the officials of the Ohio Good Roads Federation, held in Columbus this week, a legislative program for the coming winter was mapped out. It was determined to present two principal bills, one providing for a general good roads levy of one-half mill to be expended on the road system of most important highways.

PREST-O-LITE IN PORTLAND.

THE Prest-O-Lite Company, Indianapolis, Ind., recently opened a factory branch in Portland, Ore., and word has now just been given by H. H. Van Horn, who will have the management of the branch, that the Searchlight Gas Company of Chicago, Ill., will establish its Northwest branch in Portland. Several other Prest-O-Lite branches have been opened of late.

Striking Line of FLYING MERKELS

Self-Starting Attachment Dominates New Miami Features, but Various Other Changes Are Notable — Re-Designed Spring Frame, New Band Brake, Improved Motor, Reconstructed Tanks, Heavier Rims and Tires and Wider Mudguards.

NEW and radical changes, which amount to little less than a revolution in motorcycle manufacture, mark the announcement of the Flying Merkel line for 1913. The machine has been newly designed, from tires to saddle, and no more resembles its predecessors than

the number be made; in other words, just twice as much time will be devoted to each machine as would appear on the surface to be necessary.

The dominating feature of the 1913 Flying Merkel line is the adoption of a self-starter.

capital, Joe Merkel has designed for the season of 1913 a line of motorcycles containing not only all the good features of previous models improved upon, but a number of new features that cannot fail to appeal to the trade at large.

The 1913 line consists of a 4. h., 30.50 cu. in. belt or chain machine, and a self-starting model with two-speed and foot boards; also a 7 h., 61 cu. in. belt or chain drive pedal machine and a self-starting two-speed model with foot boards. As previously asserted, these models are new from tires to saddle and are not doctored up from 1912 overstock. The motor is of a new design throughout, having a bore of $3\frac{1}{4}$ and a stroke of $3\text{-}43/64$ inches; full ball-bearings are used throughout, these being Hess-Bright or D. W. F., and these bearings are used also in the secondary and idler gears. The connecting-rod bearing in both motors is of new design, made especially for the Miami company in Europe. The pistons are of entirely new design, having only two rings and weighing seven ounces less than before. The pistons are made of material that cannot be broken and the Middletown company is very emphatic on this point.

Valve Side of Flying Merkel 7 h. Twin for 1913.

day resembles night. The essential Flying Merkel characteristics, however, such as the spring frame and spring fork construction, and the ball-bearing motor, have been retained, but noticeably altered. During the last few months, The Miami Cycle & Manufacturing Co. has put up a big addition to its factory, giving 55,000 square feet of additional floor space, and not only has it filled this addition with the most up-to-date machinery procurable, but it has scrapped most of the old equipment and replaced it with new automatic machinery of various kinds, designed to do three times as much work as formerly was possible.

New Inspection System.

Perhaps the most important change is the new system of inspection which has been installed. This system is so costly that heretofore it has been applied only in the big plants making the higher price automobiles, and in high-grade watch factories. This system means that every single part of the 1913 Flying Merkel motorcycles, and bicycles and coaster brakes as well, must measure to within one-tenth-thousandth of an inch to pass inspection.

New productive heads throughout the factory make it possible to increase the output of the plant from about 6,000 machines a year to 20,000 or 25,000. Yet the policy insisted upon by President K. R. Jacoby is that instead of making this big quantity of machines, half

Other important features are the two-speed; the adoption of mechanically operated intake valves with adjustable tappets; foot-boards on the two-speed models; lower saddle position; the separation of the gasoline and oil tanks; wider mud-guards; heavier rims and heavier tires. The general appearance of the machine as usual suggests strength and raciness.

How successful an engineer may be in satisfying the demands of the trade depends to a great extent on the facilities at his command. Backed by a company in which harmonious effort is the key-note, a factory organization which is now second to none and unlimited

Some of the Improvements.

The valves are mechanically operated, and are made larger, with a seat of entirely new design for the inlet. The tappets are adjustable. The manifold pipes are larger and designed to be absolutely air-tight, insuring a perfect running motor at slow speeds. Priming cups of new design are fitted, these also being air-tight. The cylinders have been re-designed and the spark plugs are placed where they cannot foul from oil. The crankcase is also of new design with polished surface. Flywheels are made of steel drop forgings with a new system of counterbalancing. The tank is

Self-Starting Attachment.

New Rear Wheel and Frame Construction.

radically new and is made of two steel stampings, heavily tinned both inside and out, after being brazed together. On the interior of the tank are three baffle plates. These make an unusually strong tank which also presents a very neat appearance. By tinning the tank the enamel is prevented from chipping off as formerly was the case when a brass tank was used. The gasoline capacity is a little over $2\frac{1}{2}$ gallons.

Radical Changes in Frame.

The frame has been changed materially and twice as many forgings are used as heretofore. This gives a much stronger frame, though as a matter of fact the Flying Merkel never experienced any trouble with broken frames. The forks are wider and permit of the use of 3-inch tires, fitted with chains, on both front and rear. Mud-guards are of special manufacture, being of much stronger material with beaded edges, and are $4\frac{1}{2}$ inches wide. Rear forks are one inch in diameter, instead of seven-eighths of an inch, as was the case last year. The spring frame feature has been re-designed and one large spring is used in place of the two smaller ones. This spring is adjustable for different weights of riders. The new design permits of very low saddle position and makes as comfortable a machine as it is possible to design. The Merkel patented shock absorber is still a part of the hinge joint, and is made more substantial than before; it contains a much larger grease cup than the 1912 machine. The oil tank is integral with the frame and holds a little over a half gallon of lubricating fluid. Oil is fed to the motor by a reliable automatic throttle-control oiler, or left-side hand-pump, both of which have been re-designed and made simpler and more serviceable.

The rear fork ends are of new design, much heavier than in the past, and have positive adjustments for chain tensions. Rear wheels can be removed without loosening the mud-guard or letting the air out of the tire.

The handlebar control has been changed so that a new control wire can be put in by simply taking out one small screw. The wire is much heavier and does not run through the fork stem as previously. A very neat and efficient lamp bracket becomes a part of the triple clamp. The sliding parts of the spring frame and spring fork have neat leather jackets which keep out all dust and grit. The luggage carrier, which comes without extra charge on all models, is made from one-half

The Chain-Driven Twin, Viewed from Clutch Side.

inch seamless steel tubing, and is mounted on the rear mud-guard supports, which also are made of one-half inch tubing. Steel drop forgings enter largely into the construction of the luggage-carrier. As Designer Merkel expressed it, "You can't keep the riders from making a moving van out of a motorcycle, so I designed this luggage-carrier strong

View of Oil Indicator.

enough to carry a house." A very neat toolbox, enameled to match the machine, and fitted with a burglar-proof lock is supported on the rear of the luggage-carrier.

New Type of Band Brake.

The new Merkel band brake is similar to the former Merkel brake in general appear-

ance, but has been materially altered inside. It is a one-inch flat band, and the mechanism is so arranged that a contraction of the band takes place gradually, instead of binding with a jerk, a fault on some band brakes which has caused accidents. At the same time, the new Merkel band brake has a most powerful gripping surface. The two-speed gear is located in the rear hub, becoming a part thereof, and is what is commonly known as the sun and planet type. The gears are always in mesh, thereby preventing any possibility of stripping the teeth. They are designed so as to be practically noiseless and give a very liberal reduction. The control is by a lever at the side of tank; when pulled toward the rider it engages the low speed. When pushed forward the high-speed and clutch is engaged, and when midway the rear wheel is free.

Operation of Self-Starter.

The self-starter is operated by large coil springs and is of the type which has proved the only successful starter on automobiles. It will turn the engine eight times when the small pedal is pushed, and when the engine is started the first 26 turns rewind the starter and automatically kick off, leaving it ready for instant use again. The self-starter is mounted on the left side, becoming part of the crankcase and turning the engine shaft.

Equipment for 1913.

As regards equipment, a wide choice is given. Federal, Goodyear or United States tires are offered; $2\frac{1}{2}$ -inch tires being fitted to single cylinder models, and $2\frac{3}{4}$ -inch tires, both front and rear, on twins. Person's "Champion," Troxel or Mesinger "Superba" saddles are offered. The carburetor is a new model of the Schebler, designed especially for the Flying Merkel. It has an auxiliary air-valve for use when unusually high speed is desired; tests have shown more than 60 m. p. h.

Following are the list prices of the 1913 Flying Merkel types: Model 40—4 h., belt drive, \$210; model 41—4 h., chain drive, \$210; model 45—4 h., self-starting, two-speed, \$285; model 70—7 h., belt drive, \$260; model 71—7 h., chain drive, \$260; model 75—self-starting, two-speed, \$335.

A GOLD watch fob was recently awarded Joe Wandstrat, a member of the Queen City Motorcycle Club, of Cincinnati, Ohio, for covering 48 miles on a little more than a pint of gasoline.

NO RADICAL CHANGES IN 1913 HENDERSON

Detroit Machine Shows Racier Lines and More Powerful Four-Cylinder Motor, but in General Retains the Features Already Proved Satisfactory—Three-Stem Front Fork, Larger Tires, New Band Brake of Henderson Manufacture and Special Saddle.

DETROIT, November 25.—As evidence of the success of the original ideas brought out in the Henderson four-cylinder motorcycle, which made its debut about a year ago, the 1913 model of this machine shows no radical change, the differences being in small things. There is the same type of four-cylinder motor, the same long wheelbase, 65 inches, and the same kind of constructional ideas. The individual parts of the machine, however, have received attention that will bring about more efficient service on the road and greater ability in meeting all riding conditions.

For example, the motor has been made somewhat larger to give more power. The bore and stroke are now $2\frac{3}{8} \times 3$ inches, giving a power that is rated quite conservatively at 8 h. There is a drop in the intake manifold to the carburetor, and the effect of this is claimed to be a more even distribution of gas, with smoother running and more even firing.

More Oil Space and New Forks.

In the crankcase there is a greater oil capacity than before, so that lubrication is taken care of more thoroughly. There is a leveling cock for the oil, so that the rider can always have just the correct amount of lubricant in his motor. The motor bearings are now of white bronze.

The front forks show greater strength, being made on the triple-stem plan. Both sides now continue up to the handlebar, with the main stem in the middle. The spring arrangement is the same as was used previously, having performed its work excellently. The transmission is also unchanged, chain drive with an Eclipse clutch being regular equipment. The clutch control lever, on the left side of the tank, is given a longer swing, however, resulting in greater delicacy of clutch control.

On both wheels three-inch tires are used.

this large size giving long mileage and absence of tire trouble. Both front and rear wheels are also provided with large axles, $\frac{5}{8}$ -inch in diameter; the front hub is a Corbin of the knockout type.

Henderson Band Brake.

The rear hub is something new. It has a band brake, and no coaster mechanism. With

Exhaust Valve Side of Henderson Motor.

the motor started by a crank, with foot-boards and no pedals, there is no need for the coaster parts in the hub, so they are left out. This rear hub and brake are of the Henderson company's own manufacture. Extension mudguards, of the kind that come well down on the sides, are used to protect the machine and rider from road dirt. There is a large clearance between tire and guard, and the forks are made wide, so that there is much space at the sides. Tire chains can be used nicely, and clogging up when on muddy roads

is done away with. The rear fork tips are unusually large forgings, making the frame very strong at these points to take care of the heavy strains encountered.

A change that is of little consequence so far as the principles of design go, but that makes a good deal of difference in appearance, is a drop at the rear of the top frame bar. This gives a racier appearance to the mount. Naturally this involved a little change in the shape of the tank, which is sloped down at the back and made square instead of round. The finish is changed, too, being a new panel effect that is quite striking. The tank now holds three gallons of gasoline.

Other Interesting Details.

Several other little points have been given touches that improve them, although they are not radically altered. The foot-boards have been made $1\frac{1}{2}$ inches wider; a cylindrical metal tool-box is permanently attached to the frame behind the saddle, and there is a new clip to hold the stand in position when it is not in use. The design is such that it holds the stand up securely, yet allows it to be dropped easily with the foot for use, without need of soiling the hands or shoes in prying it loose from a stiff spring.

A new saddle will make its appearance as regular equipment on this machine. It was designed first for the Henderson, say the company officials, but Persons will make it a stock part of his saddle output in a short time, for it looks good. A new tandem is to be made for the Henderson for next season, the passenger to sit behind the driver. The aim in designing this was to make the motorcycle look like a machine designed for two, not as if the second seat was just a chance attachment. An unusual point is that the saddle is set two inches ahead of the rear axle. This

Striking View of the Improved Henderson for 1913. Note New Tandem Seat.

Two Sectional Views of the Henderson Motor and Diagrams of Improved Fork.

makes the machine easier to handle and improves its appearance.

A Busy Factory.

The Henderson factory is a busy place just now. It is a modern plant, erected only a short time ago, and everything is new, neat and shipshape. The plant is well supplied with light and conditions in general are favorable for the right kind of work in big quantities. The Henderson company has its own enameling plant, and has put in a nickel-plating department recently, so that it now does all its own finishing.

The Henderson Outlook.

President T. W. Henderson's office is next to the drafting room, where he is constantly in touch with everything the designing department does, as well as keeping a finger on the pulse of the entire plant. The 1913 selling season presents a very rosy hue to President Henderson. In an interview a few days ago, he said: "Why, the outlook is wonderful. At the end of the first week in October we had half of our 1913 output already contracted for, without even having talked about it to our agents. We can sell four times the number of machines that we sold this season without a doubt. We are gaining new agents at an average rate of one each day. Our output for 1913 is figured at 2,000 machines, but the chances are that it will be 3,000. We can make ten machines a day nicely, with our present factory. Detroit is a good city for manufacturing purposes—materials are all around close, where they are easily obtained.

"We haven't done any experimenting on two-speeds. With a flexible four-cylinder motor there is less need for two-speed gears, and we have not had much demand for them. We are exporting machines all over the world now, to Argentina, England, Australia, Singapore, Japan, etc. In fact, the man who took care of export orders was the busiest man in the office for a while this fall. Business is so good and coming so strong that I believe by the close of the Chicago Show our entire year's output will be sold, and applications for Henderson agencies after that will be too late. Present indications point that way. Our most sanguine expectations are being outdone by the inpouring of orders for 1913."

MOTORCYCLE AT THE FRONT.

ACCORDING to an English exchange, a Matchless motorcycle and sidecar are being used by cinematograph operators in the employ of Pathé Frères, who are now obtaining motion pictures along the firing line of the Bulgarian army.

Inlet Valve Side of Henderson Motor.

ON PUBLICITY STAFF.

HUGH SHARP, formerly assistant city editor of the *Evening Wisconsin*, of Milwaukee, is now a member of the publicity staff of the Harley-Davidson Motor Company, being associated with Frank B. Rodger in getting out the Harley-Davidson Dealer and in handling the general publicity work.

DEMONSTRATING WITH SIDECAR.

MANY dealers are alive to the fact that a sidecar is a valuable addition and aid to their business, but there is a point in practical demonstrations that has not been generally learned. A dealer who handled a number of Majestic cars this season told an interesting story on a recent visit to the factory in Worcester, Mass. "Aside from the nice profit I made from sales of the cars themselves," he said, "the first Majestic car that I had this season paid for itself within a month by the additional sales of motorcycles it enabled me to make, for it is invaluable for demonstrating a motorcycle to a timid prospect who will not venture to mount a machine before he has a clear idea of how to operate it. But I made some mistakes at first by driving the novice too fast. The majority of prospects

start with the idea that they will ride for pleasure only and, of course, the novice is not accustomed to high speeds, so after I had given a promising prospect a forty-mile-an-hour spin I found I had created a reverse impression, for he declared he wouldn't trust himself with that wild thing if it was given him as a present. Now I confine my demonstrations to smooth, easy runs, of fifteen to twenty miles an hour. The novice can talk business at that speed, and I get the orders."

THE SOUTH AFRICAN FIELD.

OWING to the fact that it can run on a 'nigger track,' the scope of the motorcycle in South Africa is enormous," says an English manufacturing representative who has recently returned from a business tour into that country. He states that the combination most in demand is a sturdy 7 h. machine with sidecar; belt transmission is barred, owing to the climate.

CINCINNATI EXPANSION

IN order that the new territory which has recently been added to Cincinnati may be well patrolled, the city officials have added six motorcycles to the police department equipment.

LIVELY ELMIRA MEETING.

AT a recent meeting and banquet of the Elmira (N. Y.) Motorcycle Club the Eclipse Machine Company cup was awarded to George Ells, winner of the second annual endurance run. Ells is a well-known dealer in Elmira, handling Yale machines. The club has made plans for next year's runs, and two gold watches and two silver cups will be offered as prizes.

ANOTHER ONE MISSING.

A 1912 model, 6 h., belt-driven Excelsior twin belonging to Ernest Anderson, of Westport, Conn., was recently stolen and the owner offers \$50 for its return. The motor number is 27,814 and the license, Conn., 308. Anderson is led to believe that the machine has been taken to New York City.

NEW H.-D. AGENTS.

WALTER KLUCZEK, of Newark, N. J., formerly agent for the Harley-Davidson, has been succeeded by the Bush & McDougall Company, of that city.

IRELAND as A

EVERYWHERE one goes along the main touring routes in Europe, motorcycles are now being encountered in rapidly increasing numbers; but of all the foreign fields awaiting conquest by the American rider there is none more promising than the Emerald Isle, but none, oddly enough, the possibilities of which seem to be less appreciated by manufacturers and riders alike in the United States. I say oddly, because the bonds of sympathy and mutual interest between Ireland and the United States are particularly strong, owing, no doubt, to the fact that during the past two-thirds of a century millions of Irish men and women have crossed the Atlantic to find a home in the republic.

However, several influences are now combining to put Ireland prominently on the map for American motorcyclists and the Yankee motorcycle trade. For one thing, many of the Irish "exiles" who, as above mentioned, sought fortunes in America, have within the past few years participated in the Irish home-going movement, which has as its object the inducement of Irish-Americans to pay an extended visit to the "ould sod" and even to settle permanently in Erin if they feel so inclined. Nothing more natural than that these Irish-Americans (many of them comparatively young men) should be impressed with the dual opportunities which Ireland presents—on the one hand as a most fascinating touring field for American riders, and on the other hand as a profitable market for machines and accessories of American manufacture.

Recruiting Irish Riders.

Another factor that is all-important in the Irish motorcycle situation is found in the new prosperity which has come to the Land of the Shamrock these past few years. This commercial and industrial regeneration of the fertile island has done double duty in furthering the cause of the motorcycle. One effect has been to put more money in circulation and to thus enable a larger proportion of the Irish population to own the motor machines. The other outcome bearing upon the case is seen in the policy of road improvements which is now general throughout Ireland and in the provision of more and better hotels in the scenic districts—an essential to the comfort of touring motorcyclists.

Statistics seem to indicate that France, Holland, England and Belgium have been the countries most favored by the Americans who have indulged in motorcycle vacations abroad—possibly due to the splendid roads in all of these countries—but in scenic beauty Ireland can vie with any of them, if, indeed, she does not surpass them all. And, as for roads, whereas all the Irish highways do not, naturally, reach the highest standard of excellence that is found in France, there is scarcely an artery of travel in the length and breadth of the island that would not be accounted, if it were located in America, an exceptionally good road, whereas some of the Irish highways, in the vicinity

of the principal tourist meccas, such as Killarney, are easily in the same class as the roads in our White Mountains and on the North Shore of Massachusetts.

On Ireland's Mountain Roads.

And since passing mention has been made of American mountain roads it may not be amiss to say a word, just here, regarding the mountain roads of Ireland. Much of the finest scenery in Ireland is to be found in the mountain districts—in County Kerry in the south, in Connemara in the west, and in Donegal in the north. It is not comparable for sheer magnificence with the Alps or with our own Rockies, but in a milder way these Irish highlands are just as beautiful, and with their mists and their play of lights and shadows they have a softness that is most insistent in its appeal. And best of all, from the standpoint of the motorcyclist, these heights are negotiated by roads of pretty good quality and with surprisingly easy grades considering the altitudes attained. Whatever deficiencies may be charged against Irish roads in any part of the island are to be ascribed principally to a too general use of carboniferous limestone.

The American motorcyclist in Ireland will find that in some districts it is a long distance between repair shops. In all the cities and larger towns garages are now to be found, and even in the isolated mountain regions that are popular with "trippers," repair and gasoline problems are no longer acute, because sight-seeing motor char-a-bancs have been placed in service on these routes within the past year or two, and the independent motor tourist profits thereby, but there are some sections where the rider who forsakes the main-traveled roads must be content with such first-aid repair work as can be performed by the local blacksmiths. It is only just to admit, however, that the average of such work is away above what would naturally be expected. Most of the blacksmiths, however primitive their equipment, have the adaptability and the proverbial "quickness" of the Irish race, and it is a pretty serious motorcycle ailment that they cannot remedy.

How Bicycle Shops Help.

Conditions for the transient as well as the resident motorcycle riders are also improving because the bicycle shops in all parts of the island are now stocking motorcycles. The Irish, alike to some other nationalities on the other side of the Atlantic, never allowed their enthusiasm for cycling to lapse as did we Americans. There has been all along a sufficiently widespread use of the bicycle to support bicycle shops in every community, and these business houses are now proving a ready-

MOTORCYCLE FIELD

BY WALDEN FAWCETT

to-hand means of introducing the motorcycle. In this respect motorcycle interests have a decided advantage over the automobile trade. Moreover, Ireland is one country where all the natural conditions as well as the sales situation is more favorable to the two-wheeled vehicle. For example, many of the Irish roads are really much better suited to motorcycle traffic than to automobiles, and then there is the circumstance that a large proportion of that population which in Ireland makes up the "possible market" consists of persons of moderate means who can more readily afford the first cost and upkeep of a motorcycle than they could the expense of an automobile.

American makes of motorcycles are not as well known in Ireland today as they will be a few years hence—especially if American manufacturers will awake to their opportunities and go after the trade. As has been already intimated the Irish in many instances are favorably disposed to American goods simply because they come from the United States, and added to this instinctive preference in the case of the motorcycle is the fact that the American machines which have been seen in the hands of touring "Yankees" have made a most favorable impression. Yet another auspicious influence is found in the circumstance that some of the most up-to-date of the cycle shops are under the management of Irishmen who have spent some time in the United States.

Handling American Accessories.

I recall one such establishment in a small town in County Mayo. This town, which is rather small in size, it seemed to me, to support a bicycle and motorcycle store, had the further disadvantage that it was not well located; its only means of rail communication being via a rather unsatisfactory branch road. Yet the dealer, a young man who only a few years ago came back to Erin from the United States, had as neat a shop as one could wish to see; carried an excellent range of stock, and provided adequate repair facilities. He already has a good trade in various lines of American accessories and supplies, and says that

he could do much better by American houses if they would only abandon their present policy of, in most cases, supplying the Irish trade only through English agencies, etc. This plan of shipping American goods to England to be shipped back to Ireland means, of course, that the Irish retailer has to pay carriage charges that are considerably heavier than they would be had the goods been consigned to an Irish port direct. Worse yet, the Irish dealer has to pay also the heavy profit exacted by the British

middleman, and the effect of this extra "overhead" is that the goods can only be offered to the consumer at higher prices than are asked for competing lines manufactured in England.

For all that Ireland is a comparatively small country and in great measure agricultural in character, she boasts a most comprehensive network of roads. The road maps provided for motorcyclists divide the island into two sections, located, respectively, north and south of the main road from Dublin to Galway, running east and west across the middle of the island. South of this dividing line there is an area of a little over 15,000 square miles, and in this territory there is an aggregate of 10,415 miles of roads that are pronounced adapted to motorcycling. North of the dividing line, in an area of 16,500 square miles, there are motorcycle routes that total 14,100 miles.

Tourists Must Watch Weather.

Motorcycling in Ireland is likely to call for more attention to weather conditions than in some other countries. At certain seasons, notably in the spring, there is much rain and, whereas it is seldom that any of the roads are impassable, care may be needed on the part of the rider. The limestone roads are likely to be very slippery when wet. On the other hand, the granite-surfaced roads such as are found throughout the picturesque highlands of Donegal are almost always better in wet weather, whereas the landscapes in this region of mists and mountains are especially impressive after a rain.

If a road is for any reason in such condition as to make riding unpleasant the motorcyclist may usually, with impunity, take to the footpath. To be sure, it is illegal to ride a bicycle or motorcycle on the footpath in Ireland, but the practice is pretty generally indulged in, the police and magistrates in most instances taking a very lenient view of the matter. This, of course, has reference to rural districts. In the neighborhood of towns and cities footpath riding is not permitted at all, but in such localities a bad road is very rare.

Possibly the courteous treatment generally accorded touring riders in Ireland is in some measure due to the fact that the members of the Royal Irish Constabulary (the rural police) are themselves enthusiasts on the subject of this form of locomotion. For years past the members of the Constabulary have used bicycles to a considerable extent, and now they are taking to the motorcycle, which, in addition to the pleasures it affords is of great assistance in the discharge of their official duties, seeing as how these officers have, in many instances, jurisdiction over considerable areas. The constabulary barracks are found at intervals on the main-traveled roads throughout the entire countryside, and the American rider, when in doubt, will always be safe in inquiring at these headquarters for information as to the condition of the roads and for lodgings in those sparsely-settled regions where hotels are few and far between. It should be added, though, that this latter is a rare condition in Ireland. Not all the hotels, unfortunately, are first class, but the smallest town will usually boast a hotel of some kind, and, to tell the truth, I do not believe that the average of these small hotels is any worse if as bad as that of many of the hotels in

Touring in the LITTLE GREEN ISLE

F. W. BAUM

IN the present instalment of the serial story dealing with his recent European tour by motorcycle F. W. Baum, the Champaign (Ill.) rider, treats of his experiences in Ireland and gives some interesting sidelights on roads, scenery and customs in the Little Green Isle. On the whole he found touring conditions highly satisfactory. His article follows:

Despite the fact that we had rough weather until the last two days my ocean trip might be called a pleasant one. It was rumored about that I was out for an extensive motorcycle tour, and many of the passengers asked me to go below and show them the machine. Those who inspected the mount thought very well of it, and I was sorry that I could not run it for them. This, of course, was out of the question as the transportation rules require all gasoline to be removed before putting the machine aboard.

We reached Liverpool at 3 o'clock in the morning, but as the tide was against us we were forced to anchor, waiting until 11 a. m. before docking. I experienced little delay with the Customs, as England is a free trade country. I left the machine at the Customs Office until I had made arrangements to take the night boat across the Irish Sea to Dublin. The passenger ticket for this trip cost \$3.25, and for the machine I paid \$1.25. I then went to the American Express office and got my mail, at the same time sending some cards to friends. Returning to the Huskinson docks, I got my machine and as I was still without gasoline I pushed it to the Dublin packet docks. About 8 p. m. I got under way for Ireland.

The Trip to Dublin.

For genuine roughness that trip across the Irish Sea beats any I ever made, but we arrived safely at the Dublin docks about 6 o'clock the next morning. I watched the loading and unloading of my machine at all times because stevedores use as little judgment as possible when handling baggage and cargo. They would unhesitatingly try to pick up a 300-pound motorcycle by lifting it by the control rods or horn or any other part. Before I could stop them they had placed one of the hoisting hooks on the pedal chain and another on the handlebars. The result was that my pedal chain was broken, and by the time the machine was safely landed the flexible end of my rubber handlebar was also broken. I at once secured gasoline—at 38 cents per gallon—fixed my pedal chain and went up to the city.

I soon became acquainted with a native motorcyclist, and together we made a circuit of the city on our machines. For the most part I found the streets fairly well paved. The tourist finds many points of interest here, among which are the Irish House of Parliament, Trinity College and Phoenix Park. While in Dublin I purchased a pair of pigskin puttees and a pair

of heavy tan shoes, getting both for the amount the puttees alone would cost at home.

The Lakes of Killarney.

I left Dublin after lunch for the Killarney Lakes, and about eight miles out of Thurles I picked up a hob-nail in my rear tire. As I started to make repairs Dame Nature, probably through sympathy for me, began to weep. Some peasants noticing my plight suggested that I put my machine in a cow-stable in the rear of their thatched cottage, which I gladly did. After waiting for the rain to abate somewhat I started on my way again and found that if I had kept going for another mile I would have encountered no more rain. There were several straight stretches which allowed me to speed up to 65 miles an hour. As a rule the Irish roads are very fine, but the turns are so frequent that speeding is dangerous; the roads are seldom marked.

I put up for the night at an inn near Holycross Abbey. This is a very impressive ruin, being built on a little hill, with a great many trees surrounding it on three sides and a lagoon on the other. The Abbey was built in 1214. A nominal fee is charged to visit the ruins, and the money collected in this way supports the caretaker. Passing along a beautiful road I noticed a very large building surmounting a hill, and upon consulting my guide I found this was known as the Rock of Cashel and that it was formerly the castle of an Irish chieftain.

Visiting a Peasant's Cottage.

Twelve miles further on I came to the pretty city of Tipperary, which is very modern compared with the other Irish towns. It is 73 miles from here to Killarney, but as I wanted to stop overnight at a peasant's home I selected a pleasant looking place about five miles from Killarney. The people were very hospitable and went to considerable trouble to fix a bed and some supper for me.

It was only a few minutes after leaving this peasant home the next morning that I found myself in the quaint city of Killarney. I was at once beset by "runners" and porters, but I decided to select a hotel myself. The Globe looked more inviting to me than the others, and while examining the register I was quite surprised to see the name of one of my former high school instructors; upon inquiry, however, I found that she had left about two weeks previously. I next procured a map of the lake district and then picked out the most contiguous route covering the parts of interest. I paid a fee to go up into Ross Castle, from which I obtained a beautiful view of the upper lakes, and then took a boat trip around the island. Returning to the village by a different route, I visited the present Earl of Kenmare's Palace, with its beautiful grounds. From here I started for the town of Kenmare on the southwestern coast.

At Blarney Castle.

On the way I passed the point on the cliffs known as "Ladies' View," where I obtained panoramas of the upper lakes and Dunloe's Gap. The lower lake is three miles wide by five miles long. From this point the roads became quite mountainous, with such quick turns that I had to exercise a great deal of caution, mainly on account of the frequency of large flocks of sheep on the roads near Kenmare. I then followed what is known as the coast road to Cork, by way of Glengarriff, Bantry and Queens-town. Although it was late in the afternoon when I arrived in Cork I thought I might as well visit Blarney Castle before dark. Leaving St. Patrick's street I crossed the River Lee and rode alongside the high cliffs.

The little park near Blarney Castle was crowded with people, as there were some sort of games going on. On being admitted to the grounds, I immediately ascended to the top of the dilapidated castle, by climbing the usual damp, spiral stone stairway. At the top I noticed three red-coated soldiers holding another by the heels in order that he might kiss the Blarney stone. There were several girls standing about and I was surprised to see the soldier, after being drawn up, deliberately walk over and kiss one of the colleens, and then tell his companions to hold him again. It was soon explained to me that the girls, who were afraid to lean over to kiss the stone, appeased their desire for "Blarney" by allowing some person who had just kissed the stone to kiss them. This was called "fresh Blarney." Seeing a pretty girl in the party I decided that I wanted to be "fresh Blarney," and accordingly had the soldiers hold me over the embankment and upon getting up I had no trouble in disposing of my kiss.

The Return to Dublin.

On returning to Cork a large stone was so violently thrown by my wheel that it dented my Purdy pump and the latter could not be used. I went to a garage and rolled out the dent, as I couldn't think of being caught on the road with a disabled pump. I also doctored a stone bruise on my rear tire with a tire sleeve, or a "gaiter," as they are called there. Dublin was only 160 miles distant and I left about 3 p. m., riding four hours before stopping for the night. From Michelston to Caker, 17 miles, I had a perfect road, which I covered at a 65-mile an hour clip. I remained at Kildare, an army post, over night. I made the 130 miles from Cork to Kildare in four hours and averaged 68 miles per gallon of gasoline.

The next morning at 7 o'clock I was on my way to Belfast, about 130 miles away. I stopped for breakfast at Dublin and also to pay a visit to the offices of the *Irish Motorcyclist*. I was very cordially received and did not get away before I had given the editor a story of my trip. While walking over O'Connell bridge and down Grafton

street I noticed that the natives seemed to stare at me. I stopped a friendly "bobby" and inquired as to the reason. He looked me over with an amused smile and then said, "Probably because you look like a wild man from the West, and maybe because you are a tourist." I took an invoice of myself at once and decided that my disreputable looking raincoat covered with gray splashings from the roads, was the main cause of the curiosity.

By Boat to Glasgow.

Nineteen miles from Dublin is the City of Balbriggan, of underwear fame, I think. The trip through this section is over a beautiful stretch of motoring highway, which, although rolling, is probably the best in Ireland. I arrived in plenty of time to see the famous shipbuilding yards, Queens College, the courthouse, of old Corinthian architecture, and other equally interesting sights, before leaving for Glasgow, via the Burns' steamship lines. The fare, including that of the machine, was only five dollars. I arrived in Glasgow early in the morning, and as I did not wish to tarry long, I saw only the necropolis and the municipal buildings.

To Edinburgh was only a 48-mile ride, but there is a good stiff descent about 23 miles from Glasgow. It seemed as if the rain followed me around and I couldn't enjoy the beauties of Edinburgh as I wished. The Royal Scottish museum and the Botanical Garden were worth a more protracted visit, but I could not spare the time. I left Edinburgh in the evening and got as far as Hawick, 51 miles, before dark and remained there until morning. Leaving the latter town early for Preston I passed through Carlisle and saw the Brougham Castle ruins. My course lay over the London road, which was in fine shape. From Penrith I came through the English lake district, which did not impress me as being prettier than Killarney.

At Shakespeare's Home.

From Garstang I went to Blackpool, the Coney Island of England. The road from here to Liverpool through Preston is very good and I made excellent time. I called at the American Express office and obtained gloves which had been forwarded to me. I took the ferryboat from the landing stage to Birkenhead, and then followed the telephone line from there to Chester. Some of the old fourteenth century Roman walls can be seen at the latter place. My route lay through Whitechurch, Shewsbury, Wol-

verhampton and the great manufacturing city of Birmingham, and thence into Stratford-on-Avon. About eight miles from this point, I was riding very fast when I observed from the corner of my eye, a motorcyclist standing along the roadside. It was not until a few seconds later that the impression in my mind took form and I was certain that I had seen an American model motorcycle. I decided to go back and I found the rider to be W. C. Anthony, a former student at Illinois University. He had a twin Excelsior and we soon fixed up his difficulty and rode on together to Shakespeare's birthplace.

Anne Hathaway's Cottage.

Thousands of names were written on the walls, ceilings and window panes of the different rooms, among which were those of many distinguished men. It used to be the custom to write your name on the wall or ceiling until 1847, when this was forbidden. After seeing this place of great literary interest, the garden, museum, memorial theatre and grammar school, we rode to Anne Hathaway's cottage, with its vines and flower-covered gardens.

An Unexpected Meeting.

Returning to Shakespeare's home, we took a couple of pictures and then started for Warwick Castle, eight miles distant. I got a fellow to take me across the Avon River to a span of the old Roman Bridge, that I might get a good picture of this grand castle, which has one wall directly on the Avon. I couldn't think of overlooking such a historical and noteworthy university as Oxford, so I stopped in the city for quite a visit. While taking a picture of one of the buildings I was agreeably surprised to see a familiar figure pass across the range of my view finder. On looking up I met the Professor of the University of Illinois and his wife. I insisted that they remain in the foreground for the picture, which they did. After a pleasant chat I bade them goodbye and started for London, when I suddenly remembered that I had purchased an English knicker riding suit, and was to have called for it by 1 o'clock. It was al-

Previous to this I was lured into a store which advertised "American ice cream sodas." The price was twelve cents and they contain the cutest little piece of ice cream, almost the size of a hazel nut and the flavor, which was supposed to be chocolate, was as thin as cocoa. I evidently showed my disappointment, for the girl asked me if they weren't like those served in America. I left Oxford over the Iffey road and then followed the Thames valley road to London, arriving there in the usual rain, and with the wet sand from the roads covering the machine and my clothing.

(To be continued.)

OREGON DEALER'S LONG TRIP

R. A. Gaertner Visited Chief Cities in Oregon and Washington by Motorcycle to Place 1913 Agencies.

PORTLAND, Ore.—R. A. Gaertner, of the firm of Andrews & Gaertner, distributors for the Eagle in Washington and Oregon, recently combined business and pleasure on a trip through the two northwestern states. The object of the trip was to place sub-agencies in all the large centers. This journey, being the first of its kind on the Northern Pacific coast, was closely followed by many motorcyclists.

Leaving the Rose City at noon he arrived at Helens by 3 p. m., where he spent the rest of the day and remained over-night. By 8 a. m. the next morning the Eagle was well on its way to Rainier, Ore., which place was reached at 5 p. m. At this point Gaertner crossed the Columbia River to Kelso, Wash., arriving at the latter town by 7 p. m. R. D. Sullivan, of Kelso, made a bid for the local agency and is now selling the Eagle in his vicinity.

Leaving Kelso by the famous Pacific Highway, which was in good condition, Mr. Gaertner made fair time, but lost his way on several occasions due to the lack of road signs. At the village of Toledo, red clay, mud and plenty of rain greeted the traveler and caused him to seek shelter in a farmhouse. Leaving Toledo the next morning, he found a good plank roadway, which can be traversed in all seasons, leading to Centralia, at which town he arrived by noon. Here J. A. McCorkle contracted for the agency for Centralia and Chehalis. Between Chehalis and Roy a heavy fog was encountered and practically no headway was made for several hours, but Gaertner finally reached Tacoma, where he made an extensive visit and closed with the firm of Brink & Martin, for the 1913 Eagle agency.

PITTSBURGH M. C. OFFICERS.

A MOTORCYCLE club recently formed in Pittsburgh, Pa., will operate under the name of the Pittsburgh M. C. H. R. Nash was elected president; J. H. Ward, vice-president and W. J. Black, secretary.

LAST RUN OF SEASON

A SUNDAY run to Ipswich was held recently by the Aberdeen (S. D.) Motorcycle Club. This was the last official run of the season and a large number of members attended.

A 1912 battery model, 4 h. belt-drive Harley-Davidson was recently stolen from J. M. Rush, of DeCliff, Ohio, and \$25 reward is offered for its recovery. The machine was equipped with free-wheel control, Goodyear studded tires, and Old Sol No. 8 light.

Shakespeare's Home.

ready past that hour and when I arrived at the shop I found that the door was locked; in fact, all the stores were closed. Not knowing what to do I went to the police station and told them my story and it was not long before they had a clerk there and I received my package. It seems customary for stores in England to close at 1 p. m. on Thursdays.

The Rock of Cashel.

A YANKEE ON EUROPEAN ROADS

MAXIMILLIAN ST. GEORGE

IN the following graphic article, Maximillian St. George, who has now returned to Chicago, after an extensive European tour by motorcycle, deals with his experiences in Italy and Spain. In addition to touching at the larger cities, Mr. St. George, managed to deviate from the ordinary tourists' routes and thus pick up many points that throw light on the countries and their peoples.

As I did not care to ride over the bad roads between Naples and Rome, I shipped my motorcycle as baggage from Castellammare to Genoa. The transportation charges were a little more than \$3. I was requested to drain out all the gasoline before shipping, but no one examined the tank. A small tip to two of the guards insured good handling of my machine. As it is the custom in southern Italy to cheat the visitor whenever possible, I think it worthy of mention that I gave one Italian almost double the price of an article and was hurrying away when he called me back and returned the amount. Speaking of the tendency to bunco the visitor, I might mention a case in Bozen, Austria. I stopped at the Central Garage for gasoline and was charged \$1.32; they claimed to have put nine litres in the tank, at 65 hellers a litre, whereas the tank will hold only seven and a half litres and there were over two litres in it when I made the purchase.

As might be supposed, the scenery to Genoa was very attractive. On arriving at the latter place I was vexed to find that my magneto cut-out had been broken off, and that the tube for my pump had been stolen. The thief must have acted out of pure meanness, as he could have no use for the pump, the European valve being different from the American type. The only safe way in shipping is to take off all easily detachable parts. The lamp or speedometer may be left on, but the fact should be noted on the receipt or bill. I experienced some delay in having a special tube made for my pump.

Leaving Picturesque Italy.

My course lay along the sea through Noli, Savonna and many other small villages, in which the road customs vary considerably. One must watch the warning at the entrance to a village in order to know which side to take. The road is by no means good, and in some places it is badly torn up. Through the villages the streets are paved with roughly layed "flagstones." In this section the scenery was not above the ordinary; in fact, it was somewhat disappointing.

I stayed overnight at an inn at St. Stefano, which like other inns in Italy was well kept and clean. The price was very reasonable. It is the general opinion that Italian hotels are poorly kept and dirty, but my experience has been that while

they do not appear inviting from the outside, the interior is usually clean. Beyond San Remo the scenery becomes quite attractive, and the roads also improve. I soon reached Grimaldi, the Italian customs station, and simply gave up my Italian permit, while the officer made a note of my exit on my International Pass. At Garavan, the French customs station, a few hundred yards further on, I presented my customs ticket for France, together with the International Pass, and in return received a permit to ride in France for three months, for which I was charged eleven cents.

Along a Sea Road.

Mentone, on a promontory jutting into the bay, is the first town after passing the customs station. The old town with its narrow and winding streets, still maintains its feudal aspect. The unrivalled Corniche road hence to Nice, nineteen miles distant, via Monaco and Villafranca, passes through most exquisite coast scenery. It is much better, however, to take the ascent from Monaco to the Grand Corniche, regarded by some as the finest coast drive in the world. It passes through Turbie, Cap de Ferrat, Beaulieu and Eze, with striking scenery at each turn.

The road hugs the sea passing through Cannes, Antibes, Frejus and Toulon, thence over the Maritime Alps. About six miles from Le Muy I stopped for the night. I inquired at a couple of hotels on the main thoroughfares and found the prices to be too high, so I stopped at a smaller inn on one of the side streets. The tourist will find better accommodations at lower rates and will also be able to place his machine where he will feel free to tinker with it, at the small hotels or inns. In the morning I continued along the splendid road passing through Le Muy, Le Luc, Vaudeban, Aix, Salon, Arles, Nimes and Montpellier. At a bank in Aix I spent half an hour getting an American Express money order cashed, which requires an endless amount of red tape. Nimes is abundant in Roman ruins; the amphitheatre is in my opinion far superior to the Coliseum, in Rome. Here is located the Pont du Gard, one of the grandest Roman works in existence.

An Ideal Host.

From Montpellier, on the way to Beziers, darkness overtook me. I turned off at a branch road leading to Cette, but soon discovered my mistake. On inquiring for a night's lodging, I was directed to the Barac, I believe, an inn near Poussan, between Gigan and Meze. In all my travels I have never met a more accommodating man than the proprietor, and have never received better treatment. A large number of automobiles stop at his inn for gasoline and oil. I purchased gasoline at forty-five centimes a litre, or forty-three cents a gallon. It is always best to buy gasoline outside of towns or villages, as there is generally some sort of a duty to pay otherwise. Gasoline and oil may be purchased outside of any town at a general price of fifty-five centimes a litre, or fifty-three cents per gallon. At some places, however, the price comes somewhat higher. Unless the gasoline

is passed through chamois the carbureter is sure to give trouble, as water and other foreign matter is often found in it.

The next morning I rode through Beziers, Narbonne and Perpignan to Le Boulou, near the Spanish border. This fine road leads through a land of vineyards, where people were busy picking the luscious fruit. I made many stops along the wayside to eat a bunch of grapes. From Le Boulou to Perthus, a six-mile ascent to the French customs station, the road is supposed to be good, but I found it rather poor and cut up. It is needless to say, however, that the scenery was beautiful.

My International Pass, papers and all my persuasive powers, availed me nothing at the Spanish customs headquarters. A deposit of three pesos was required for every kilo weight of the motorcycle. My word that it weighed 110 kilos was not questioned, but as I had not 330 pesos at the time, I offered to deposit \$60 in American gold, provided it would be returned to me on leaving Spain. This the official assented to and accordingly made out a pass allowing me to tour in Spain for one year. He forgot to charge me for the certificate, but did so on my return.

Where a Bluff Saved the Day.

A three-mile descent over splendid road brings the motorist to La Junquera, the first Spanish village. At the entrance to the village I was stopped by a soldier of the "Inspeccion de Vigilancia," and had to present my permit and papers for inspection. In going down the narrow street of the village I had the misfortune to knock a man down. I saw that he was not hurt and by putting up a bold front I was able to get off before anyone could call a gendarme. I grasped the supposed injured arm of the man, pulled up his shirt-sleeve and then told him that nothing was the matter; I drew the bystanders' attention to it and rode off. To Figueras the road is exceptionally good, but it becomes narrow, winding and very bad

to Besalu. Just outside the village I had to ride through a shallow river, ascend a very steep incline and turn sharply over a difficult bridge. Thence to Banolas and Gerona the road is again good. At the latter place I paid about 65 cents per gallon for gasoline. This is the usual price in the larger towns, but at times one has to pay as much as 87 cents per gallon. The road to Tordera continues good with few exceptions.

In the morning I continued over a poor, narrow road to Malgrat and Mataro, at which place the road widens and is again good to Barcelona. Barcelona is one of the most enterprising and beautiful cities in southern Europe. The newer section of the city reminds one somewhat of the better sections of Boston and Washington. I followed the splendid road to Tarragona, once the center of Rome's power in Spain, to visit the Marquis de la B. After a two days' visit I returned to Barcelona to see a bull-fight. I had intended to return to France by a different route, but as I had made a deposit at La Junquera, I had to follow the same course as when coming.

I should also state that I took pains to stop over with my "ideal host," the proprietor of the inn near Poussan, who was as affable as ever. There seems to be a tendency to make little of the requirements of American tourists in some sections, and when one meets a really genial host the impression received is likely to linger.

The small photograph at the left, on the opposite page, shows a characteristic Italian vista with a well-preserved castle in the background; the upper picture on the same page gives a view in Nimes, France, and the lower picture shows an impressive bridge on the outskirts of the town. The photograph at the left on this page shows the aqueduct Puente del Diablo (The Devil's Bridge), at Tarragona, Spain; the upper picture at the right is of a typical French village, and below appears a striking view of the French Riviera, the city built on the promontory being far-famed Monaco.

RECORD-SMASHING as A BUSINESS

by RAY SEYMOUR

MOTORCYCLE racing is a game of many funny kinks, and had I actually seen that unfortunate Hasha-Albright crash on the Newark (N. J.) track last September I probably would have a different story to tell today; I am of the opinion that it would be a tale of my retirement from the motorcycle racing game. I was a competitor in the fatal race, and might easily have gone down with my friends, but as luck would have it I rode clear and did not know what had happened to the other boys until I saw the red flag and stopped. Then Frank Hart, the ex-champ of the amateurs, rushed over to me and broke the news. It was a hard blow, but I had been spared a view of the accident itself, and, as I have intimated above, the latter circumstance probably accounts for my being still in the racing game.

Every motorcycle racer has scores of friends who give him advice to the effect that he should take up something safer, and I am no exception. I receive all kinds of advice from well-meaning people, and while it is all appreciated, I have not been able to bring myself to the point of acting upon it so far. My friends admit that there is good money in motorcycle racing, if you are a top-notch, but they argue that "money won't do you any good if you figure in a bad crash," and, of course, they are pretty nearly right. Still I don't worry about going down in a mix-up on the track; at least, I never did until the day of that Newark accident. Since that time I have done some serious thinking, and I don't mind saying so.

My Start as a Racer.

I was 16 years old when I started racing; that was five years ago, and I have been at it pretty steadily ever since. I was earning \$15 a week in a Los Angeles repair shop when the fever struck me. I won the first event in which I competed—a three-mile novice race, in which I had to ride my head off against two other boys. This event was held on the Los Angeles dirt track. I used a 1¼ h. Reading Standard machine in my first race, and for the next three years I stuck to machines of this make. As might be expected, I became deeply interested in racing as soon as I had won my first event, and the fact that I was employed by a motorcycle

firm in repairing and selling machines paved the way for me to compete in other contests. However, motorcycle races were not very plentiful in those days, and for some time one race a month seemed to be my limit. I was on the lookout for all kinds of racing programs, and as the sport grew in popularity I gave more attention to it. In the summer of 1909 I felt justified in taking up racing as a business, and decided to make an eastern trip. I won quite a few races in the East and then returned to Los Angeles for the winter, entering the employ of John T. Bill & Co.

During 1909 I was sent to Indianapolis by the Reading Standard folks, where I entered the National F. A. M. meet on the Speedway. It will be remembered that this meet was called off because of the roughness of the course; I entered only one event, finishing third against a field of riders of national standing, despite the fact that they were mounting special machines and my mount was of the stock type.

Hanging Up My First Record.

Some time before the Indianapolis meet I set up my first record, at Los Angeles. It was in a 10-mile amateur race, and the officials clocked me at 8 minutes and 10 seconds. I

couldn't hardly believe the time was correct, but the timer assured me that it was, and of course I was elated. During 1910 I went after the racing game hard. I found it profitable to be an "amateur," for most of the prizes I won were in the form of orders for merchandise, and I promptly turned them into cash. The F. A. M. is to be commended upon the reclassification of riders, since everybody at all interested in racing knows that trade riders were far from being entitled to classification as amateurs.

Early in 1910 I quit my job and went to Salt Lake City, where I rode as an amateur for several months. There I became well acquainted with Jake DeRosier, and he took me to Philadelphia, where I rode his famous No. 21 Indian in the championship races at the F. A. M. National Meet for that year. It was at Philadelphia that I won the amateur championship, and I believe the one-mile contest in this series is the greatest race I have ever ridden. However, that's going a bit ahead of my story.

Getting Into the Limelight.

There were races covering two days on the dusty old Point Breeze track in Philadelphia, and on the first day I came into my own against such amateur stars as Marty Graves, W. J. Teubner, E. G. Baker and Harry Nixon, on Merkels; Walter Goerke, Freddie Huyck and J. Boyd Anderson, of the Indian camp, and Frank Hart, who was then mounting a Reading-Standard. Although the newspapers referred to me as the "seventeen-year-old wonder," I had really passed my nineteenth birthday before I competed in the races at Point Breeze. Throughout the meet Jake DeRosier treated me like a son, and with his coaching I gained confidence rapidly. When the mile championship was announced I went to the tape prepared to win and lost no time in jumping into the lead.

A Great Race.

Graves, on his Merkel 7, was hot on my trail and he remained there like a leech as we spun that old triangular track. That's what made it a great race. It took everything I knew and the best that was in my machine to prevent Graves from passing me, for more than once he was on the point of doing it. As we swung out on the last turn for the mad dash to the tape we were neck and neck, but I cut in very close and nosed my opponent out by a few feet. Hart went out with a soft tire. Teubner made a bad start. Robinson spilled, and Goerke and Huyck finished third and fourth, respectively.

Ray Seymour,
Board Track
Record Holder,
Who States
That His Track

Winings for Two Seasons Have Totalled no less than \$8,000.

Some Disappointments.

In the last event of the day, the 25-mile for the 30:50 class, I went against a field of ten. Teubner took the lead away from Goerke after a great chase, which I viewed through the dust ahead, and on the sixteenth mile I brought the crowd to its feet by passing the Pottstown rider. However, I had a hard time keeping the lead, for Teubner hung on to the very last. When I was on the next to the last mile I thought of the small gasoline tank that my Indian carried, and I was afraid I wouldn't have enough "juice" to carry me across the line a winner, but it did the trick.

My first-day victories put me in a very confident mood for Saturday, and I had my cap set for the 10-mile championship and the one-hour championship, but I was a victim of tough luck, for my machine developed tire trouble when I was leading by half a mile. My fellow-townsmen of the Merkel camp—Marty Graves—captured the 10-mile title, while Anderson, on an Indian, won the hour event. During the whole day all I won was a prize for the mile time trial (59½ seconds), and third place in the 15-mile handicap, in which I was scratch against a mile and a quarter handicap given the first two men who placed.

After the "Philly" meet DeRosier and I struck out for Salt Lake City and the West, and after riding a while in Salt Lake, DeRosier, Balke and myself went on to San Francisco. The first board track ever built was in my home town, Los Angeles, and it was there that I first rode a motordrome. Late in October, 1910, I broke the world's amateur record for a mile on that track when I traveled the distance in 41½ seconds. That record held until May of this year, by the way.

In the Professional Ranks.

When winter came on in 1910 I went to work for the Hendee Manufacturing Company, in the San Francisco branch, as a salesman. I turned professional on April 1, 1911, or, rather, I was "turned" by the San Francisco Motorcycle Club. My first professional race was early in April, when I entered an event over the San José 25-mile course. Later I established the world's record for a mile on a dirt track over that course, when I covered the distance in 47½ seconds. I won every other race I entered there. During the latter part of April I visited Oakland and captured every event in which I competed. My next stop was Salt Lake City. It was there that I won forty consecutive races on my No. 23 Indian.

I won the biggest purse I ever rode for at Sacramento. It was during Jubilee Week, and motorcycle races were held on the one-mile dirt track. The race in question was for the best three out of five heats at five miles. The purses were: \$300 for first place and \$200 for second. However, I cannot boast about winning this race, or the series of races, as the only riders against me were Collins and Johnnie Albright, who did not have as fast machines as I did. I rode my first eight-valve Indian in this contest.

Beginning with February, 1912, I rode at the Stadium at Los Angeles, but a hoodoo seemed to be with me, and I won but few races; poor Eddie Hasha on an eight-valve took all the important events. At last my luck changed, and on May 17, 1912, I broke all records from one to 21 miles inclusive, and on May 24 from 21 to 30 miles, on my 7 h.

Indian, No. 35, an eight-valve model. These records still hold. I made the first mile in 36½ seconds, which was at the rate of 97.82 miles an hour, and I believe this is the highest speed ever attained by a motorcycle. Oscar Hedstrom figured it out that I covered exactly 143 feet per second in that first mile.

Winning Another Title.

I was all primed for the F. A. M. meet at Columbus in the middle of July, and when I came away I had added the five-mile professional championship to my list of titles. Eddie Hasha nosed me out of the 10-mile championship event. At Columbus I won, among other events, the three-mile open and the five-mile open races against Hasha and Graves. I left Columbus feeling that I had again shown my right to claim the professional championship, which I rightly felt heir to at Los Angeles when I broke the records in May.

I traveled back to Chicago, where I continued to win steadily all the rest of July, and about the middle of August I started an Eastern invasion, stopping off on the way to Newark at Columbus and Cleveland. It was late in August when I finally landed in Newark. The last time I rode was at Newark, in fatal race of which I spoke at the outset of my story. I was heartbroken at the loss of Hasha and Albright, two of my closest friends, and was very glad when the Indian folks ordered me to quit racing for the season. At present I am traveling for the Hendee company, and expect to keep at this until the opening of the racing season in 1913.

This story would not be complete without speaking of my earnings as a professional. I give the figures, not because I am proud of them, but because I know they are of interest, and I am not ashamed to make them public. In my first year as a professional I earned \$3,000, and for the current year I have earned \$5,000, bringing the total for two seasons' racing of three months each up to a little more than \$8,000.

Frank King, Now Among the Winning Riders on the Big Los Angeles Bowl.

Larry Fleckenstein, a Star in the Present Los Angeles Speed Squad.

MOTORCYCLES ON WARSHIP

Several Officers of U. S. S. Wyoming Have Single Trackers for Use Whenever the Big Sea Fighter is in Port.

BROOKLYN, N. Y.—Not to be outdone by their fellow officers of the Army, who use motorcycles on duty as well as for pleasure trips, Uncle Sam's naval officers have also taken to the motor two-wheeler. On board the U. S. S. Wyoming there are a number of motorcycles which are used by the officers whenever the dreadnought happens to be in port. On board the vessel the machines are stored in a special compartment, as far as possible from the magazines, so that danger of a fire is practically eliminated. When an officer desires to take a spin while the vessel is in port, his motorcycle is brought on deck, picked up by an electric crane and swung outboard to the pier or dock.

The method of slinging the machines is quite novel. A rope about one inch in diameter is arranged in a sling and fastened to the steering-head and at the seat-post. A piece of board, notched on the ends, is inserted in the sling so that the strain on the machine is in a vertical direction, and the danger of wrenching the frame of seat-post tube is done away with.

OPEN ROCKFORD ROOMS.

ALMOST 100 members and out of town guests were present at a banquet given recently by the Rockford (Ill.) Motorcycle Club to celebrate the opening of its new club-rooms. The rooms are located in the heart of the business district of the city, and occupy two floors. The members presented President Fred Sullivan with a handsome loving cup as a token of their appreciation of his good work during the last season.

ABOUT twenty riders recently participated in a secret destination run held by the Salt Lake City Motorcycle Club. A number of young ladies joined the boys on this outing.

The NEW RIMS

A little information of interest and importance to jobbers, dealers and riders, concerning the fitment of tires to the old and the new types of rims.

ALTHOUGH the adoption of a new standard of rim design and measurements will ultimately prove highly advantageous to both the trade and the riders, the change from the old to the new is bound to cause confusion in the minds of those who do not appreciate that a quite radical step has been taken. A representative of MOTORCYCLE ILLUSTRATED, who called at the Goodyear, Diamond and Goodrich plants in Akron recently, was especially urged to publish the by no means generally known facts regarding the fitment of 1913 tires to the old and the new style rims. The data published herewith, obtained from the motorcycle sales managers of the Goodyear and Diamond companies, and also a booklet, entitled "The New Motorcycle Rims," issued by the United States Tire Company, should be carefully studied by every jobber, dealer and rider.

Three motorcycle rims have been definitely decided upon for next season. They will be known as "AA," "BB" and "CC" rims.

An "AA" rim will take 26 x 1 $\frac{3}{4}$, 26 x 2, 28 x 1 $\frac{3}{4}$ and 28 x 2 inch tires.

A "BB" rim will take 26 x 2 $\frac{1}{4}$, 26 x 2 $\frac{1}{2}$, 28 x 2 $\frac{1}{4}$, 28 x 2 $\frac{1}{2}$ and 29 x 2 $\frac{3}{4}$ inch tires.

A "CC" rim will take 26 x 2 $\frac{3}{4}$, 26 x 3, 28 x 2 $\frac{3}{4}$ and 28 x 3 inch tires.

The new "A" rim will be about the same as the old 2-inch motorcycle rim, being changed a very little in profile. As this rim is used almost exclusively for racing wheels it is merely necessary to say that it accommodates 1 $\frac{3}{4}$ and 2 inch tires in 26 and 28 inch sizes.

The old rim, known last year as the 2 $\frac{1}{2}$ -inch, will take tires in the following sizes: 26 x 2 $\frac{1}{4}$ inches; 26 x 2 $\frac{1}{2}$ inches; 28 x 2 $\frac{1}{4}$ inches; 29 x 2 $\frac{3}{4}$ inches.

The 1913 output of all motorcycle manufacturers will be equipped with either the "BB" or "CC" rims. However, it will be necessary for the dealer to carry a stock of tires for the old 2 $\frac{1}{2}$ -inch rims so as to take care of the owners of old machines. In the spring it will be necessary for dealers to have a stock of tires to fit the "BB" and "CC" rims in order to take care of re-orders for tires on 1913 machines.

The "AA" Rim.

The "BB" Rim.

The following is a list of the rims which manufacturers will use on their 1913 machines.

Excelsior Motor Mfg. Supply Co. (Excelsior), "BB" rim.

Aurora Automatic Machinery Co. (Thor), "BB" rim.

Miami Cycle & Mfg. Co. (Merkel), "BB" and "CC" rim.

Emblem Mfg. Co. (Emblem), "BB" and "CC" rim.

Consolidated Mfg. Co. (Yale), "CC" rim.

American Motor Co. (M-M), "BB" rim.

Black Hawk Mfg. Co. (Black Hawk), "BB" rim.

Flanders Mfg. Co. (Flanders), "BB" rim.

Greyhound Motor Works. (Greyhound), "BB" rim.

Harley-Davidson Motor Co. (Harley-Davidson), "BB" and "CC" rim.

Henderson Motorcycle Co. (Henderson), "BB" rim.

Hendec Mfg. Co. (Indian), "BB" and "CC" rim.

Ives Motorcycle Corporation (Monarch), "BB" rim.

Minneapolis Motorcycle Co. (Minneapolis), "BB" rim.

MacLeod Mfg. Co. (Bailey Flyer), "BB" rim.

New Era Autocycle Co. (New Era), "BB" and "CC" rim.

Pierce Cycle Co. (Pierce), "BB" rim.

Reading-Standard Co. (Reading-Standard), "BB" and "CC" rim.

Schickel Motor Co. (Schickel), "BB" rim.

Triumph Mfg. Co. (Triumph), "BB" rim.

Waverly Mfg. Co. (P. E. M.), "BB" and "CC" rim.

Pope Mfg. Co. (Pope), "BB" rim.

Excelsior Cycle Co. (De Luxe), "BB" rim.

All new rims will be single clinch. Some of the tire manufacturers are making two 28 x 2 $\frac{1}{2}$ -inch tires this year, one for the old rim and one for the "BB" rim. The Goodyear company is making three 2 $\frac{3}{4}$ -inch tires—one 29 x 2 $\frac{3}{4}$ -inch four-ply tire for the old rim known as the 2 $\frac{1}{2}$ -inch rim, one 29 x 2 $\frac{3}{4}$ -inch three-ply tire for the "BB" rim and one 28 x 2 $\frac{3}{4}$ -inch three-ply tire for the "CC" rim.

Inasmuch as there is bound to be more or less confusion this season, owing to these dif-

ferent rims, the Goodyear company has gotten out a rim gauge.

It is absolutely necessary that every order given by a dealer or jobber should show whether the tires are to be used on a "BB," "CC" or the old style rim.

The United States Tire Company thus explains the difference in the new rims: "The 'BB' rim takes the place of the old 2 $\frac{1}{2}$ inch rim and accommodates 2 $\frac{1}{4}$ and 2 $\frac{1}{2}$ inch tires in 26 and 28 inch diameters, also 29 x 2 $\frac{3}{4}$ inch tires.

"This 29 x 2 $\frac{3}{4}$ inch tire is exactly the same as the old 28 x 2 $\frac{3}{4}$ inch tire which fitted the old 2 $\frac{1}{2}$ inch rim, except that we have changed the marking to read '29 x 2 $\frac{3}{4}$ inch to fit 2 $\frac{1}{2}$ inch 'BB' rim, inasmuch as the diameter is 29 and not 28 inches.

"The 'CC' rim, which will be an entirely new rim and made for use on twin cylinder machines especially, will accommodate 2 $\frac{3}{4}$ and 3 inch tires in 26 and 28 inch diameters. As this rim will be about one-inch smaller in diameter than the old 2 $\frac{1}{2}$ inch rim and will also be somewhat wider between the clinches, we will make two entirely new tires in the 2 $\frac{3}{4}$ and 3 inch section to fit this rim. On account of the rim being smaller in diameter the 2 $\frac{3}{4}$ inch tire made for this new rim will measure, when on the rim and inflated, very close to 28 inches instead of 29 inches, as is the case with the 2 $\frac{3}{4}$ inch rim. This 2 $\frac{3}{4}$ inch tire, made to fit the 3 inch rim, will be marked: 28 x 2 $\frac{3}{4}$ inch to fit 3 inch 'CC' rim."

Then there will also be a 28 x 3 inch tire for the "CC" rim.

The 2 $\frac{3}{4}$ inch tires made for the two different rims are not interchangeable. Therefore, in ordering tires it is always necessary to state for what rim the tire is required.

For instance, if you want a 28 x 2 $\frac{3}{4}$ inch tire to fit an old 2 $\frac{1}{2}$ inch rim, you should so specify and your order will be filled with an old size 28 x 2 $\frac{3}{4}$ inch tire or a new size 29 x 2 $\frac{3}{4}$ inch tire, either of which will fit the old 2 $\frac{1}{2}$ inch rim.

If you want a 2 $\frac{3}{4}$ inch tire to fit the new "BB" rim you should order a "29 x 2 $\frac{3}{4}$ inch tire to fit a 'BB' rim."

If you want a 2 $\frac{3}{4}$ inch tire to fit the new "CC" rim you should order "28 x 2 $\frac{3}{4}$ inch tire to fit a 'CC' rim."

The "CC" Rim.

*Four Years Ahead of Our Nearest Competitor
Five Years Ahead of the Rest*

**Self-Starting
Two-Speeds**

THE FLYING MERKEL

**Spring Frame
Spring Fork**

DECLARATION!

The new and sweeping improvements found exclusively in the 1913 Flying Merkel Motorcycles mark the greatest advance yet made in motorcycle construction. They amount to little less than a revolution in the industry. All other makes are placed just about five years behind the times by comparison with the Self-Starting, Two-Speed Flying Merkel.

Read the whole story of these wonderful improvements and you will say with us: "The ideal motorcycle has at last arrived!"

Thirteen years of careful, painstaking manufacture have been necessary in order to achieve the high degree of perfection now attained in the 1913 Flying Merkels.

We have just completed an immense addition to our factory, and have filled it with nearly a half million dollars' worth of the most modern machinery in order to insure absolute reliability and perfection in this masterpiece of motorcycles.

Some of the most efficient productive engineers known to the cycle and automobile industry have been added to our staff. We have installed a new system of inspection which is the most rigid and thorough-going in existence. Because of its great cost this system heretofore has been applied only in plants making \$5,000 automobiles and high-grade watch manufactories. Every single part which enters into the construction of the 1913 Flying Merkel Motorcycle must measure accurately to the one-ten thousandth part of an inch. Our materials are the best the world knows and of special analysis.

Yet with these enormous facilities and this increased power of production we could easily double the limit of production we have set. However, we shall leave "quantity" production with its attendant short cuts and rush methods to our competitors. For ourselves, we prefer to make half as many, but **MAKE THEM RIGHT.**

POWER

COMFORT

Some Flying Merkel Features

SELF-STARTER—Heretofore only the highest-priced automobiles have been fitted with this wonderful labor-saving device. The Flying Merkel Motorcycle positively will be the only motorcycle fitted with a self-starter. The adoption of a Self-Starter on a motorcycle presages a revolution in the motorcycle industry. The Flying Merkel Self-Starter is a compact device adding practically no extra weight or bulk to the machine, and is started by a slight pressure of the foot on the pedal. It is a positive acting, self re-winding starter and of the type which has proved the *only* successful starter on automobiles.

TWO-SPEED HUB—The combination of a Self-Starter and Two-Speed Hub instantly makes the 1913 Flying Merkel Motorcycle the most luxurious two-wheeled vehicle ever placed before the public. The Two-Speed gear is located in the rear hub and is of the sun and planet type. Gears are always in mesh, preventing any possibility of stripping teeth, and so designed as to be practically noiseless. The reduction is 1.5 to 1. Control is by lever at side of tank.

POWERFUL TWIN MOTOR—The 1913 motor is entirely new and more powerful, speedier and more flexible than any of its predecessors. It is a long-stroke motor, having a bore of $3\frac{1}{4}$ inches and stroke of $3\frac{43}{64}$ inches, giving a piston displacement of 60.89 cubic inches. The world-renowned Hess-Bright ball bearings are used throughout, these being of entirely new design and made especially for us in Europe. No expense has been spared in making this the finest motorcycle power plant in the world.

FOUR HORSEPOWER MOTOR—The single cylinder motor is identical in construction with the seven twin, with the exception of the number of cylinders. Bore and stroke are the same, the piston displacement of the single being 30.445 cubic inches. Valves on both single and twin are mechanically operated with adjustable valve tappets. The crank case, which is newly designed throughout, is made of the highest quality aluminum, beautifully polished. "The fastest and most powerful single" aptly describes it.

REAR WHEEL CONSTRUCTION—Every rider instantly will appreciate the value of this drop-out rear wheel construction. A puncture on the road formerly meant arduous labor in squeezing out the rear wheel, skinned knuckles and lost temper. By simply detaching the chain and unscrewing the two axle nuts, the rear wheel can be removed in an instant without disturbing the adjustment. The entire rear frame structure is of special drop forgings. A new straight line support stand of triple truss design makes this item the simplest and at the same time the staunchest stand designed.

SPRING FRAME—Of entirely new design, the 1913 Flying Merkel Spring Frame makes it still the most comfortable motorcycle in the world. One large spring with rebound spring and compensating pneumatic plunger, which is adjustable for riders of varying weights makes it possible to ride over the roughest roads with no discomfort whatever. A hinged-joint shock-absorber still further promotes easy riding. The Spring Frame and Spring Fork features alone make the Flying Merkel the most desirable of all motorcycles.

BAND BRAKE OF NEW DESIGN—All twin cylinder models will be fitted with a new and powerful flat band brake, which leaves nothing to be desired in this very necessary factor for safety. While it has the most powerful gripping surface of any brake made, its action is gradual, a feature much sought after but until now not attained by anyone. The famous Musselman Automatic Coaster Brake, so long and favorably known, will be fitted on Models 40 and 41.

MUFFLER CUT-OUT AND OIL GAUGE—This is the simplest and most effective cut-out yet designed. Easily operated by the foot, it can be instantly opened or closed and always remains in the position set. The outside oil gauge is a distinctive feature and permits the rider to see the level of oil in the crank case without dismounting. The leaky, non-transparent crank case window which it replaces is now made obsolete by the introduction of the new outside protected oil gauge.

COMFORT

Model 41—4 Horse-Power, Chain Drive, \$210.00

SPECIFICATIONS

MOTOR—Single cylinder, 4 h. p. Bore $3\frac{1}{4}$ inches. Stroke, $3\frac{43}{64}$ inches. Displacement, 30.445 cubic inches. Hess-Bright ball bearings used throughout. Mechanically operated inlet valve, with adjustable tappet. Crank case of polished aluminum with new outside oil gauge.

CARBURETER—New Merkel-Schebler improved type with auxiliary air valve for high speed.

CONTROL—Merkel Patent leverless double handle bar control.

MUFFLER—Entirely new design, very compact and noiseless, fitted with positive self-adjusting cut-out easily operated by foot.

FRAME—New Improved loop design spring frame made of AAI Standard Welding tubing. Low saddle position. All working joints covered with oil and dust-proof leather jackets.

WHEELS—28 inches, 36 extra-heavy motor spokes front and rear, new type single clinch auto-type steel rims for $2\frac{1}{2}$, $2\frac{3}{4}$ or 3-inch tires.

FORKS—Merkel Patent Truss Spring Fork, a unit with front wheel—proved the safest and strongest fork in the world.

MUD GUARDS—Beaded edge, $4\frac{1}{2}$ inches wide, with leather flap front and rear.

WHEEL BASE—55 inches, making unusually easy riding machine.

TRANSMISSION—One quarter inch x $\frac{5}{8}$ -inch pitch roller chain.

FREE ENGINE CLUTCH—Eclipse 1913 improved. Operated by side lever with positive notched segment control.

BRAKE—Improved Musselman Automatic 1913 type.

SADDLE—Choice of Persons' Champion, Troxel or Mesinger Superba.

TIRES—Choice of Federal, Goodyear or U. S., 28 x $2\frac{1}{2}$ -inch.

IGNITION—Bosch, high tension, ball bearing, gear driven armored magneto.

LUBRICATION—New Improved automatic drip feed throttle control with safety latch and auxiliary left side force pump.

TANKS—Stamped of special analysis sheet steel, heavily tinned inside and out and with triple baffle plates.

GASOLINE CAPACITY— $2\frac{1}{2}$ gallons. Oil tank integral with frame. Capacity one-half gallon plus.

TOOL BAG—Metal case with burglar-proof lock, attached to luggage carrier.

LUGGAGE CARRIER—Made of $\frac{1}{2}$ -inch seamless steel tubing, with cold-rolled stamped connections and tubular braces.

PRICE—\$210.00 f. o. b. Middletown, Ohio.

\$100.00 IN GOLD

Models 75 and 45 are the most wonderful motorcycles ever offered to the public, and to make them justly famous all the world over, we will give \$100.00 in gold to the reader of this paper who submits the most suitable name. There are no strings to this contest. Anyone can enter it, and each entrant may submit as many names as desired. Simply write the names on a sheet of paper and mail to the Miami Cycle & Mfg. Co., 300 Hanover St., Middletown Ohio.

A committee of five has been selected to decide the winner. The contest will close at noon, December 15th. The Flying Merkel, "Autocrat," "Rambler," "Tourist," etc., are some of the titles already submitted, but they lack ginger. Read the specifications carefully and send in your selections. YOU have as good a chance as anyone to win the \$100.00. Get your friend to help you. Remember, the contest will close on Dec. 15th at noon.

TO DEALERS—The 1913 Flying Merkel Motorcycle will be the most popular machine on the market. If you have not already done so, it will be to your interest to wire today for terms and territory. Next week may be too late.

The Flying Merkel Bicycle — Model 345 — Price, \$45.00

SPECIFICATIONS

FRAME—20, 22 and 24-inch. Made of one-inch cold rolled seamless steel tubing throughout, with oval rear stays and offset rear forks. With extra $\frac{1}{8}$ -inch bar running parallel with top bar. Joints are flush with extra long heavy fish-mouth reinforcements.

FORK—Truss construction, Motorcycle Type, with three plates, and heavily reinforced seamless stem sides; enameled to match frame.

CRANK HANGER—The Flying Merkel 2-piece, Tool Steel Cones, made of Micyc Tool Steel of special analysis. Bearings are enclosed in a sleeve.

NOTE—The Flying Merkel Crank Hanger is made under our D & J Patents, which thoroughly cover a bicycle crank hanger with the ball cups enclosed in a steel sleeve, with the buttons opposed.

SPROCKETS—Front, 60 tooth. Rear, 18, 20 or 22 tooth.

WHEEL BASE—45 inches. Tread, $4\frac{1}{2}$ inches.

COLOR—Flying Merkel Orange, double fine line black stripes. Option, Merkel Blue with gold stripes.

WHEELS—Rims are made of selected

Michigan Hard Maple, well seasoned. Finish, orange with black stripes to match frame; 36 heavy Diamond E spokes .092 gauge are used in both front and rear.

HUBS—Merkel self-oiling, turned from solid steel bar with $\frac{1}{4}$ -inch balls.

CHAIN—Half-inch pitch, Roller, $\frac{1}{8}$ -inch, Diamond No. 65. American made.

TIRES—Federal single clinch, $1\frac{1}{2}$ inch. Option, Federal 666 or Fisk 66.

HANDLEBAR—Motorcycle Type, 21 inches wide, $6\frac{1}{2}$ -inch drop with forged stem, $3\frac{1}{2}$ -inch extension. Option, Kelly or Hussey, Models 1 to 6, inclusive.

SADDLE—Eagle Easy with nickel-plated spring. Option, Persons' Overland or Troxel 30-U.

PEDALS—Motorcycle Type with Rubbers.

SEAT POST—8 inches x $\frac{13}{16}$ inch, Seamless steel with drop forged top.

TOOLS—14-inch frame pump, adjustable wrench, oil can and crank wrench. Wrench and oil can in a neat leather pocket case.

GUARDS—Steel front and rear with Leather Flap. Guards are enameled to match frame, and fastened with double flat steel braces, nickel-plated.

COASTER BRAKE—Musselman Automatic.

POWER

COMFORT

DRESSING *for* WINTER TRIPS *The* OLD SCOUT

NOW that the chilly breezes of winter begin to make their presence felt, many a rider will regretfully put his motorcycle into dry-dock until the approach of another season, unless, of course, he is so fortunate as to live in a region where the two-wheeler is in its glory throughout the year. Still, you will find a constantly increasing number of enthusiasts who refuse to give up the sport on account of wintry breezes, or even snow. Any person, however, who contemplates cold weather riding should make due preparation—indulging in a lengthy spin in a freezing temperature may be attended by very serious results.

If one has good red blood in his veins, there is a certain satisfaction to be derived from a motorcycle jaunt when the mercury is hugging the bottom of the tube. The cold, bracing atmosphere acts like a tonic, and though the sharp, invigorating sting of the air as it zips past may make ears and cheeks tingle, the sensation is not altogether unpleasant; always considering, of course, that the rider is properly dressed for the occasion—a light weight suit and thin underwear were never meant for winter motorcycling.

A Timely Warning.

In the first place, if you are not strong, physically and constitutionally, don't try any cold weather stunts. A rider who comes back from a two-hour trip chilled to the marrow, blue-lipped and shivering, had best leave this phase of the sport alone. It takes a good amount of vitality to face a winter gale without being chilled through and through, and

no one can afford to take chances with his health.

Nor should a person attempt cold weather riding when not in good trim; that is, when feeling run down and out of sorts. Many people are more or less subject to colds, and if you happen to have a cold, just postpone the trip till it has passed by. When you have a cold, your system is ready to take a good grip on any disease germs that may be floating around.

You might gather from the foregoing that I am opposed to cold weather riding; but I am far from such an idea. Still, I do realize the danger that may be involved, and since so many persons—motorcyclists included—are likely to be careless in these matters, it is just as well to pen this brief warning.

Where Protection Is Needed.

The most vulnerable portions of our anatomy are the feet, neck, and chest. In motorcycling, care of the feet is not so important, as they will get a fair degree of warmth from the hot engine. Nevertheless, it is a good idea to have a pair of extra heavy woolen socks for these occasions. I am a regular crank on the subject of warm clothing for outdoor work of this kind; its importance has been driven home to me on various and sundry occasions.

The woolen socks, leggings, and heavy underwear—the heavier the better—will probably afford sufficient protection for the lower parts of the body, but no amount of woolen sweaters or shirts will prevent the cold wind from striking through to the chest. A chamois vest

is practically impervious to the wind, but not many riders happen to own one; I don't, anyway. Fortunately there is a substitute almost as good, and a thousand times easier to procure—simply a newspaper folded across your chest and held in place by a common vest buttoned up over it. There is really more warmth behind that newspaper than in a thick woolen sweater, because wind will go straight through the pores of the cloth. Don't laugh; give the newspaper stunt a trial. Of course, you can put as many sweaters over the paper as you wish, and they'll do much toward keeping you warm, but the newspaper does more than its own share of the work.

A Pointer on Gloves.

It is not a bad plan, if the weather is frigid, to put on a short overcoat over all the rest, provided you happen to have an old one that is big enough. In my own case, there is hardly room for anything more over the mess of duds that I crawl into; but you may be sure that I keep warm and comfortable and enjoy the ride, no matter how cold it is.

The common gauntlet gloves are not proper members of our cold weather outfit; they are a little better than nothing as a protection to the hands, but that is all one can say for them. I usually discard gloves entirely in my cold weather forays, wearing instead heavy woolen mittens with long wrists—regular teamsters' mittens. And even with them my fingers manage to get cold sometimes, so that I am compelled to stop and hold them up to the genial warmth of that portable stove, the engine.

MOTORCYCLE POLOISTS.

PRESIDENT B. J. PATTERSON, of the F. A. M., forwards the accompanying photograph of a motorcycle polo game, undoubtedly one of the most extraordinary views ever obtained with the motor two-wheeler occupying the center of the stage. It will be noted that the players use quite hefty mallets and that headguards are required.

That it requires skill of a high order to wield the mallets without beheading a fellow rider or figuring in frequent smash-ups will be evident at once, and only the most daring and experienced motorcyclist should consider motor polo as a pastime.

President Patterson points out that polo players who use horses are often seriously injured through collisions, but he argues that

no motorcycle poloist will risk demolishing his machine for the sake of a spectacular play. In other words, great caution is necessary, and that the riders of Pratt, Kan., and vicinity possess this quality as well as all the other essentials, is proved by the fact that they have already indulged in a number of spirited games without a serious accident. President Patterson appears at the right.

In winter riding goggles are an absolute necessity; they are really needed for warm weather riding, but in the winter one simply cannot get along without them for any length of time. And since the subject has come up, it might be proper to remark that altogether too many of the fraternity fail to supply themselves with goggles in all their riding. Some fellows seem to think—goodness knows why!—that wearing goggles is a sign of weakness, an effeminate thing to do. Occulists will tell you that eye troubles are becoming more and more frequent among people who ride much in automobiles. Not only is the steady rush of air, and the pressure thus caused, very injurious, but the dust and impurities add to the damage which may be done. Good eyesight is too precious a possession to be risked needlessly, and the eyes are too delicate to stand much abuse. The moral is easy to find: get a suitable pair of goggles and use them; especially in cold weather, for the eyes are very susceptible to a cold gale.

Warm Cap Completes the Outfit.

And finally, don't neglect a protection for your ears, for they are also very susceptible to cold. Personally I have never experienced an ear ache, but from what people say who have had such an experience, I should judge it is something earnestly to be avoided. A good heavy winter cap—the folding kind that can be pulled down to cover the ears and back of the neck—is a fine investment for any motorcyclist who hankers after the road in mid-winter.

It does not seem that any person could question the value of the following suggestions, which are the result of four years' riding experience. Doubtless many motorcyclists have already been convinced of the need of proper clothing in cold weather, but my personal observation would indicate that there are not a few who require a waking up, and an attack of pneumonia is a mighty poor sort of alarm clock. There is a lot of fun in winter riding, but at any cost keep warm.

DOCTORING THE FROST-BITTEN MOTOR

Some Pointers and a Warning or Two for the Motorcyclist Who Puts His Machine to the Test of Icy Winds and Slushy Roads.

BY WILLIAM HETHERINGTON, JR.

AFTER the motorcyclist has toggled himself until he is prepared to face the icy blasts that sweep over winter roads, he should turn his attention to the mount upon which he depends for his cold-weather excursions. There is not a great deal to be done in this direction, but a few wrinkles may be found worthy of attention. For example, it is possible on some types of motorcycles to modify the exhaust pipe or pipes so that three branches may be tapped from the exhaust; when this can be done one branch may be run conveniently near the seat so that the rider who finds his fingers getting numb on the road may "toast" them a bit without leaving the saddle. By running a branch of the exhaust to either pedal-rest the same heating principle may be applied to the rider's feet. In such arrangements the machine owner must use a reasonable amount of common sense, of course, and the idea will be found quite practicable.

The winter rider should also give special attention to his oiling arrangements. It is generally known that the standard brands of summer oil will not give the desired results in cold weather, but too many riders neglect this point. When the motor sticks, as an effort is made to turn it over on a cold day, it is probably because the oil has gummed, owing to its thickness. A considerably lighter grade of oil than is used for summer work should be bought for winter riding.

Getting the Cold Motor Started.

Formerly it was splendid exercise to start a cold motor by pedalling, but this has practically been done away with. Sometimes, however, the engine will refuse to "take notice" and there is trouble. This may usually be avoided if the rider will squirt a little kerosene into the pet-cock or plug aperture when he dismounts. If this is done the engine will start quite easily, although it may be thoroughly chilled when it is desired to get under way again.

As a motor will always start more easily with a warm air supply it may be found advisable to run a tap from the exhaust pipe

to the air intake on the carburetor for winter riding, so that warm air will be fed. In addition to providing for an easier start this system should permit of smoother running of the motor. If it is not practicable to warm the air in this way, the rider who finds his engine suffering from chronic "non-starteritis" may place a few drops of ether on a cloth and hold it against the air intake, thus producing a mixture that will start almost anything. A piece of warm waste held over the air intake has also been known to give surprising results.

Preventing Generator Trouble.

The winter rider often finds when his lamp is most needed that the water in the generator is frozen, but he may usually avoid such an emergency by placing a few drops of alcohol in the water. If the water is already frozen the rider may utilize his exhaust pipe to thaw it, or the troublesome generator may be held under the muffler.

More than once when using the separate generator type of lamp I have obtained water by melting some snow, thus supplying the generator and avoiding dangerous night riding without a light. However, it is a poor policy to rely entirely upon this type of lighting system for winter riding; it is far safer and just about as economical to fit a combination system.

NEW CANADIAN CLUB.

AT a recent organization meeting of the motorcyclists of Welland, Canada, the Welland Motorcycle Club was formed and the following officers were elected: C. C. Warner, president; S. D. Dunn, vice-president; E. T. Schmall, secretary-treasurer. D. F. Forbes, E. Lambert, C. C. Warner, S. D. Dunn and E. T. Schmall compose the executive committee. Members were also appointed for the publicity, touring and racing committees. The club has affiliated with the Canadian Motorcyclists Association.

LEE HUMISTON took every race in which he was entered at the Los Angeles Stadium on November 17.

YALE ADVERTISING COUNSEL.

THEODORE F. MACMANUS, advertising counsel for the Yale, occupies a unique position in the motorcycle industry, as he is the man behind the big campaign of national advertising that the Yale is pushing. MacManus is retained by the Yale in practically the same way that a lawyer is retained for legal advice. He is the head of the MacManus Co., the big advertising agency in Detroit and Toledo. This idea, although a new one in the motorcycle field, has been proved successful by experience with one or two big automobile concerns. MacManus is at present giving similar advice to the Studebaker corporation, and much of the success of the Cadillac Co., is due to Mr. MacManus's publicity work for them at an earlier period.

Mr. MacManus has been acquainted with automobile and motorcycle developments for several years, and in this way has acquired a very intimate knowledge of the sales advertising problems that arise and the best ways in which to meet them. It is the expert

knowledge born of this wide experience and the unusual ability of the man as an advertising writer that makes his experiences so valuable.

INDEPENDENT BOSCH DISPLAYS

ANNOUNCEMENT is made that the Bosch Magneto Company will not exhibit its products at either the New York or Chicago Shows, owing to the fact that the division of spaces for the annual displays did not permit of satisfactory arrangements by the company. The spaces assigned were entirely too small to accommodate the extensive Bosch exhibits and to permit the company to entertain its many visitors at the shows, so it has been decided that the products of the firm will be shown independently at the New York and Chicago headquarters of the company. The New York display will be found in the spacious quarters at 223-25 West 46th street, and in Chicago the exhibition will be at the company's branch on 24th street, near Michigan avenue. At both establishments special arrangements will be made to entertain visitors and to display the many types of Bosch ignition products, over two hundred in all.

LEWIS STROH, of Indianapolis, Ind., has completed a 15,000-mile motorcycle trip through the southern states and reports having spent only \$2.75 for repairs.

SEVERAL score Harley-Davidson riders of Denver, Col., who recently posed for a panorama photograph. The picture is forwarded by Walter Whiting, H. D. agent in the Mile-High City, who is naturally proud of his squad.

NINETEEN THIRTEEN.

ABOUT a year ago, the writer ventured the prediction that 1913 models would show practically no price reductions, but rather disclose a disposition on the part of manufacturers to give the rider more value at the same prices. The prophecy is being realized with a vengeance. And in this connection we must also admit that another prognostication, made as late as two months ago, has proven to have been quite inaccurate. Unable to understand how the builders of motorcycles could give much more for current prices, we felt quite certain that this year's improvements would be limited to refinements only. Instead, one finds set forth in 1913 announcements a delightful array of radical changes for the better. Nine out of ten of the 1913 improvements have been introduced specifically for the purpose of adding to the rider's comfort and of simplifying and rendering easier the operation of a machine. Very little that the auto owner can enjoy will be beyond the reach of the users of 1913 motorcycles. The latter will have motor power in excess of all possible requirements; two-speeds to wipe out the erstwhile twin terrors—hills and sand; wonderful spring frames and other shock absorbing devices; well-nigh perfect control systems, including ingenious devices which will rob the starting problem of all its former tribulations—in sum and substance, powerful, reliable, dependable, handsome and comfortable pieces of mechanism, beautifully and cleverly designed, stanchly built annihilators of space.

The 1913 motorcycle bids fair to prove one of the real big sensations of the coming twelfth month.

F. A. M. IS READY.

OUTLAWRY with reference to the operation of board tracks was discussed in a frank manner between the F. A. M. directors and several motordrome promoters and owners at the St. Louis session a fortnight ago. To all appearances, nothing remains of the movement which, it is now known, was seriously undertaken several months ago. It seems that the board track people have come to the conclusion that co-operation with the F. A. M. is not only good sport, but good business as well. There is less disposition to deprecate the value of F. A. M. influence, aid and protection, and promoters are anxious to sign long-term contracts with the governing body. No secret is made of the fact that a big break-away had been all but arranged, but the half-hatched plan to "go it alone" on a "strictly business basis" is now admitted to have been a stupid conception. That is, by the best element in the board track promotion field, and this element is now at the top of the

heap. There may be a dissenter or two, and among them someone determined to try to throw over the organization. The Federation's position, however, is remarkably strong at the present time, and no fear is felt of the result of any outlaw attack that may now be in the making. None is in prospect just now; still the F. A. M. is ready.

ENTIRELY UNCALLED-FOR.

CHAIRMAN THORNLEY, of the F. A. M. Competition Committee, might do well to give notice that he will in the future, decline to entertain any proposition to rush through a restrictive board track agreement. The telegraphic vote taken on a recent application was nothing short of ridiculous. As a matter of fact, it produced a mess which only a special meeting of the directors could have possibly cleared up. The members of the board have had their lesson, and they may be depended upon to insist upon something better than a snap vote upon a question of such importance. In other words, promoters will find it to their advantage to have their applications in Chairman Thornley's hands at least thirty days in advance of the date on which they contemplate starting to build. In many instances, there has been more than one application for the same city, and the directors have been called upon to judge as between two or more applicants over-night, as it were. On the face of it, this is an absurd procedure, and it is quite safe to predict that there will be no more of this unseemly haste. The directors have made it quite plain that they do not propose to have promoters force them to decide until they have had a reasonable opportunity to carefully study each situation.

THE F. A. M. DIRECTORATE.

MEETINGS of the F. A. M. Board of Directors should be held at least quarterly. The business of the organization has developed to such proportions and importance as to demand that the directors "get together" at reasonable intervals. The results of the St. Louis session were easily worth ten times the outlay required to pay the actual traveling expenses of each member of the board in attendance. Matters which had been hanging fire for a month or more under the handicap of the exigencies of correspondence were disposed of without the slightest difficulty at the St. Louis meeting. Another session should be held during either the New York or Chicago Show, preferably the latter.

THE SECOND-HAND MACHINE.

IT'S no longer young, this suggestion, but timely withal. We address ourselves to the several thousand dealers in the United States, and would warn them against the

temptation of making ridiculously high allowances for second-hand machines taken in part payment for new models. A comparatively small number of agents have reduced this exchange business to a scientific system, insuring them satisfactory profits, but it is doubtful whether any of them could explain their systems so that another would understand. They succeed, however, because they steer clear of the haphazard methods which too many dealers, in their anxiety to make sales, practice in all parts of the country. How many dealers are there who make adequate provisions for a reasonable return on their investments, in addition to a proper salary for the labor and thought they contribute to the business? The aggregate of their sales may reach comfortable proportions and still pay practically no dividends over and above the owner's actual earning capacity. We believe that the indiscriminate acceptance of junk at absurd prices is more than anything else responsible for this condition of affairs. The clever dealer makes it an almost invariable practice to at least break even on machines taken in exchange. Why shouldn't he? The old machine has a certain value which any dealer of intelligence and a little experience can estimate almost to a dollar. That figure should be the dealer's dead line. Surely the rule is simple enough, yet how few dealers seem to understand that its constant infraction is positively menacing to the success of their business?

Second-hand machines will soon appear by the thousands. Their number is not likely to be any greater than that of those who are prepared to pay reasonable prices for used machines. Please note that we say *reasonable* prices. If the dealer allows much more on the average exchange, the second-hand market will pass him by in a body, as it were, and make its purchases from the agent who can sell at value prices, because he doesn't allow more than value on machines taken in exchange.

It's all so very simple, and yet how many will refuse to be guided by the rules of the only safe and sane policy of conducting an agency? It is quite probable, however, that, having learned by rather expensive experiences in 1911 and 1912, at least several hundred dealers will shy clear of the unbusiness-like exchange "system" in the future.

HARRISBURG OUTING.

A LARGE attendance marked the recent sociability run of the Nomad Motorcycle Club, of Harrisburg, Pa. The trip was made to York by way of Middletown, Mt. Joy, Marietta and Columbia, and returning the party passed through Wellsburg, Dillsburg and Mechanicsburg.

DENVER WANTS IT.

DENVER enthusiasts want the 1913 F. A. M. meet. Although the 1912 National Assembly adjourned only four months ago, the Denver boys have already placed themselves on record as prepared to guarantee a big fund and an attractive program. The meet has never been held west of the Mississippi, and although San Francisco is practically slated for the 1915 gathering, Denver's bid for the 1913 honor will undoubtedly be given serious consideration by the directors. A number of the Middle Western cities will again be in the field, but the prospects favor either the choice of a city in the Far West or one in New England. At any event, any opposition to Denver will have to be unusually strong and well organized to defeat the worthy aspirations of the Queen City folk.

UNCLE SAM'S O. K.

AFTER a series of exhaustive tests, the Postoffice Department of the United States government announces its intention to purchase twenty-five motor three-wheelers for city use in the collection of mails. Taking it for granted that these machines will give satisfactory service, hundreds more will be put into use during the next two or three years. The fact that the government has satisfied its critical requirements is the best proof obtainable that the motorcycle delivery van has demonstrated its commercial value. The field is one of huge dimensions and great promise. As yet, its possibilities have merely been guessed at. If ever the manufacturers satisfy the demand for pleasure machines, they will still always have ahead the pleasant prospect of interesting in commercial motorcycles the thousands of business folk who appear quite ready for practical demonstrations.

OUR MISTAKE.

AN amusing "deadly parallel" appeared in our issue of November 14. In the advertising section, on one page appeared a piece of copy referring to "twelve thousand readers of MOTORCYCLE ILLUSTRATED." On the opposite page was a similar advertisement reading "thirteen thousand." The first copy was an inadvertent repetition of an advertisement which originally appeared six weeks ago. In the interval, the circulation of this paper had passed the thirteen thousand mark. It's no exaggeration to state that even we sometimes lose track of the circulation growth of MOTORCYCLE ILLUSTRATED. The odd discrepancy above referred to proves it.

OUR AFFECTIONS SECURE.

STRANGE as it may seem, some representative English manufacturers and riders who have been pioneers in developing and introducing the motorcycle are now in danger of being lulled into at least temporary forgetfulness of the motor two-wheeler by the siren song of the cyclecar. There is evidence of this tendency in the British Show which opened at Olympia on November 25. Cyclecars are everywhere, and while the list of motorcycle exhibitors is as imposing as in any previous year there are indications that something has been sacrificed in behalf of the Show debut of the cycle-type fourwheeler.

ON this side we are at a loss to catch the present English drift. We look upon the cyclecar as a snappy and quite presentable little vehicle with claims to relationship in both the motorcycle and automobile families, but there is no danger of our permitting it to curtail the affection we lavish upon the single-tracker, even though the cyclecar boom should be communicated to this country as has been predicted. We believe the motorcycle has its own field, safe from the encroachment of even the tidiest of cycle-built fourwheelers, and that the recent extraordinary expansion of this field will continue. American cyclecars may come in time, but it is our opinion that they will not cause our motorcycle manufacturers a single uneasy moment.

TIMELY POINTERS.

IN another section of this number will be found timely articles on dressing for winter motorcycle trips, and doctoring the motor for cold-weather traveling. These are phases of the sport which no all-year enthusiast can afford to overlook. Winter riding has charms all its own, but they are dependent to a great extent upon warm togs and a motor that has been tuned up a bit for the special service that is to be demanded of it.

THERE STILL IS TIME.

ANOTHER option on 800 square feet of additional space has been taken by the Chicago Motorcycle Show committee, which means that there is still hope for the latecomers. Better get on the wagon; it's out to break a few records this year.

HERE is November twenty-eighth and some of our manufacturers have placed fifty per cent. of their 1913 outputs. 'Twould take a mightily sprightly calendar to keep pace with 'em.

IN 1912 it has been the "Big 4." Nineteen-thirteen will see the "Big 5." featured in hundreds of motorcycle markets. One wonders whether five is the limit of a single cylinder's capacity for horsepower. Or will there be, some of these days, a one-lunger "Big 6"? Seems impossible, but who knows?

LOOKS as though we shall have to revise upward, as Payne, Aldrich and their fellow conspirators did the tariff, our estimates of a 1913 production of 100,000 machines. However, there's at least no danger of an over-supply.

JACK PRINCE proved himself a master of the gentle art of oratorical persuasiveness at the St. Louis meeting of the board of directors. The irrepressible track builder won his case by a mile. No wonder he's such a screaming success as a promoter.

NO DOUBT about it—1913 will be a sidecar year. What with clutches universal, two-speeds nearly so, and power to spare, the three-wheeler is sure to come into its own in America.

FIFTY to one hundred per cent. increase in production will be the rule for 1913 in plants manufacturing motorcycles, tires, parts and accessories. Can anyone imagine a better rule?

EXPORT departments are now the order of the day in the organization of American motorcycle factories, their foreign business having outgrown their respective domestic sales forces.

THE fact that the Newark board track sold for \$9,500 at auction would seem to indicate that there is still hope for motorcycle racing in the New Jersey city.

WHAT a relief to have racing and its more or less exquisite et ceteras confined to a handful of tracks during these quiet, peaceful months of winter.

"BELT or Chain?" The topic has a rather familiar sound. Where have we heard that question discussed before?

THERE is much to be said for the foresight of the youth who files an early application with Santa Claus for a 1913 motorcycle.

ANENT nineteen-thirteen's big business: "We told you so."

ENGLISH NOTES "BRITISHER"

The Cyclecar Dominant—Variable Gears — Weatherproofing—Mixed Transmissions—Automatic Carbureters — Decompressors — Larger Tires—The Humber Three-Speed Model and a Type of Collapsible Sidecar.

THE mammoth British Show evinces only two features which a shrewd prophet would not have outlined twelve months ago. One is the decompressor, a tiny detail fitting, which a casual survey of the Show might have missed altogether, and yet destined to be of no small help in popularizing motorcycling as a practical means of locomotion among the non-athletic. It enables a rotund "drummer" of sixty years to do his journeys on an 8 h. twin road racer, free from qualms about starting troubles, for with a decompressor in action the heaviest twin quits the owner's doorstep as gently as a liner leaves the quay.

Fitted to passenger outfits, it obviates the danger of backfires, and makes the pullover of a high compression 1,000cc. engine a job which an intelligent child of six can perform. It seems likely to weaken the kickstarter, so popular in England last fall; for the kickstarter was apt to jam up with mud, and owing to the necessity of throwing its sprockets out of gear, the chain sometimes got lost through disalignment. With a decompressor fitted—and they are cheap and simple and reliable—any engine is easy to start. The other innovation—and it is a big one, fraught with infinite possibilities—is the cyclecar. This 1912 Olympia Show will be remembered in the history of the industry as the birthday of the cyclecar. Over a hundred different makes are on the roads and the market, the Cyclecar Club is duly launched, and a journal specially devoted to the newcomer's interests, published its first issue on November 25.

Great Confusion of Design.

IT is impossible to give any complete notion of cyclecar design, or even to prophesy with confidence which notions are likely to survive. At the bottom of the list we find simple French vehicles, scaling only three or four hundred-weight, and selling at about the price charged by high-grade makers for a two-speed twin-cylinder motorcycle. Such designs have an aircooled engine, carried in the bows of a long, narrow tandem-seated chassis, singly sprung in front by a sliding pillar with tension and compression coil-springs threaded over it; sprung astern by semi-elliptics steered by reels and wire cables, driven by belts and expanding pulleys, which drop the belt through onto a ballbearing ring to get a free engine.

The Refined Rudge.

SUCH a design can only have a fleeting popularity in a country where precipitous hills are common, and where users expect a certain measure of refinement, and hope for prolonged wear in spite of rough usage. The English improvement on this French prototype is well exemplified by the Rudge, which has a refined chassis, with a slipper type of body, multiple disc clutch on the engine shaft, chain drive to a counter shaft, and variable pulleys transmitting the drive to a solid rear axle, beltdrive being relied upon to spare the tires in corner work. At the other extreme we find a vehicle like the Singer, which is simply a luxurious automobile in miniature, with four-cylinder water-cooled monobloc engine, shaft drive, three-speed B. N. D. steel gears, cone clutch, mechanical lubrication, gate change, differential axle, detachable wheels—vide the 5,000 dollar car specification. Between these extremes there is every possible variety.

Friction Disc Drive.

A DESIGN with possibilities is that incorporating friction disc drive, of which there are several examples. Friction disc drive has pauperized many an inventor and capitalist, when applied to heavier designs, but the prolonged successes of the 8-10 h. G. W. K. cyclecar show that it has possibilities on a chassis weighing no more than a quarter of a ton; and the simplicity and cheapness with which it provides a free engine, reverse gear, and infinite variable forward speeds, ranging from say 3 to 15 to 1, is strongly in its favor. If we must prophesy, it is probable that the new trade will soon settle down into the hands for half a dozen leading firms. The most popular type will be the ultra-light spider quad, on motorbicycle lines, with small, highly

efficient air-cooled single-cylinder engine, slipper body, and belt drive through variable pulleys to a solid axle.

Economy Will Count.

SMALLER outputs should be retained by the sounder intermediate designs, notably the pick of the tubular chassis with V water-cooled twin engines and friction drive. At the top end of the list the miniature automobile will hold its own; it offers most of the delights of full-size motoring with extreme economy of upkeep; for the tire bill of a 5-cwt. four-wheeler will be only a quarter of the same item as charged against a 15 h. one-ton automobile.

Some Motorcycle Details.

IN two respects which widely yell for improvement, British design remains tolerably stagnant, namely springing and lubrication. The original motorbicycles had rigid forks, and about 1901 spring forks began to appear. These forks have been gradually improved, and saddles have been made more efficient, but no other springing improvements have really been standardized. The weight and the want of lateral rigidity common to all spring frames have so far proved insuperable obstacles. The original motorbicycles had splash lubrication, oil being poured by hand through a plug in the crankcase every 20 miles; except that a pump has been substituted for the bottle, lubrication remains practically unaltered. The drip sight-feed is gaining ground, but can only be regarded as a makeshift. The mechanical oilers introduced up to date are not regarded with favor on this side.

Transmission the Main Interest.

HOWEVER, in respect of transmissions there are huge advances. Variable gears are absolutely standard on every single make. It may be questioned whether either of the leading types of gear will hold its ground for more than twelve months. The favorite gear is the three-speed hub, made in two patterns, each of which incorporates a multiple-disc free engine clutch: these hubs are fool-proof, light, cheap, and reliable. The solo pattern has its direct drive on middle ratio, and with a $4\frac{1}{2}$ -in. engine pulley and 18-in. beltdrum, affords gears of say, 3, $4\frac{1}{2}$ and 7 to 1;

The Humber $2\frac{3}{4}$ h. Three-Speed Model.

by adjusting the engine pulley, higher or lower series are instantly obtainable. The sidecar patterns drive direct on top, and with a 4½-in. engine pulley and 18-in. beltdrum, afford gears of 4½, 7½ and 9, reducible to 6, 9, and 12, for difficult country, by adjusting the engine pulley.

These gears have got any two-speed gear beat to the limit, by dint of the usefulness of their intermediate ratios; but they have drawbacks. They make the rear wheel awkward to remove for tube or cover changing; and they put weight in the wrong place, and make the rear half of a frame more bounceable than ever; in spite of this they are steadily pressing the two-speed gear off the market in all its forms. They will yield in turn to the three-speed countershaft gear, which puts weight in the right place (central to the wheelbase), and does not obstruct the removal of the rear wheel, while it further makes a combined or "two-step" transmission a very simple proposition. British riders retain their old prejudice against a complete rigid transmission, whether chain or shaft, but they are losing faith in the direct belt drive, because the rubber belt has ousted the leather belt completely, and the rubber belt slips like fury when it is wet, and is run off a small engine pulley.

The Combined Drive.

THE booming transmission of the moment employs a chain with a 50 per cent. reduction from the engine to a countershaft, which may or may not carry a gearbox. The chain is neatly encased in a box made either of aluminum castings or of steel pressings; if aluminum, the split is vertical, and the front half is made swiftly detachable; if steel, the split is horizontal, and the lower half may hold an oil bath. These cases are unpopular because of their bulbously ugly appearance; if scolloped, they look well, but admit dirt. Consequently it is more than possible that the primary chain item of these two-step drives will give way to an *enclosed shaft drive* from engine to countershaft. This should wear better than a chain item, and its slender case will not spoil the appearance of the machine, which is a great factor in England. There are one or two examples already on the market, and they seem to be satisfactory.

Simplified Carbureters.

THE growth of automatic and semi-automatic carbureters is due to two factors. The old school of athletic and sporting riders still cling to the two-lever carbureter, and maintain that its efficiency is unbeatable. But there is now a strong infusion of elderly utilitarian riders in our ranks, men devoid of speed proclivities, and asking only for an automatic machine. The carbureter this growing army wants is either a single-lever type, or a two-lever type, of which the air-lever is only shut for starting or very slow running. Simultaneously the cyclist likes an accelerator pedal control, so he too asks for a single-lever type; and consequently the two-lever type is fading into the background.

Some Details.

BRAKES remain as they were; the front brake is designed not to be too powerful, for fear of accidents, and is usually of the tire-rim type, operated by flexible wire from the left handlegrip. The rear brake is a pedal operated shoe on the beltrim; on chaindriven machines, a dummy beltrim is fitted for braking purposes only. Coaster hubs and bandbrakes are anathema to British riders, and some of the new chain-driven machines have

An English Sidecar Which is Collapsible, to Economize Storage Room.

toggled internal expanders, resembling the rear hub brakes of an automobile. The magneto advance is normally worked by a flexible wire, from a radial handlebar lever, though a few firms retain tank levers. Frames are rigid, with costly and luxurious saddles, and forks sprung by two pairs of hinged links, acting against compression and tension springs. The front wheel has a stand, which when out of use serves as extra stays for the front guard, which is boxed in round the tire, and has a backflap. The frame has double top tubes, with the tank fitted between them, sometimes hung on slips, sometimes bolted to flat ears brazed to the lower tube.

Motor Construction.

THE cylinder can in all cases be removed with the crankcase in position, sufficient clearance being left for it to be slid off forwards, with the connecting rod at the back of the crankcase, and the piston at the foot of its stroke. Engines remain unchanged; 85 mm. bore x 88mm. stroke, mechanical side-by-side valves, two-ring piston, roller bearings to the big-end, plain phosphor bronze bush for the gudgeon pin, and ballbearings for the crankshaft being recognized practice. There are a few overhead inlet valves about, but the automatic inlet would be shooed out of the Show.

The magneto is gradually being removed to a higher position behind the cylinder, on a platform cast integral with the crankcase; it is chain-driven, and slots in its platform allow for chain adjustment. The carbureter is mounted astern on the cylinder, with a very short inlet pipe which is dead horizontal. Pedalling gear is scrapped, a kick-starter or decompressor or handle being preferred; a few firms retain pedalling gear in lieu of kickstarters, but only as a starter, not as a propeller.

General Equipment.

BELTSHIELDS are not unknown, when the direct belt drive is retained. The carrier is made of steel tubing, with brazed joints, and carries the rear mudguard, which widens out to bear the registration numbers on its tail. Pannier toolbags are bolted to the carrier sides by bent plates, bolts and D nuts, which cannot under any circumstances shake adrift. Nickelplating is giving way to black stoved enamel; the handlebar, and some accessories, are covered with a skin of black celluloid, on

a few leading machines. Cone-adjusted wheel-bearings are the more popular. The pivot of the rear brake is usually brazed to the frame before enameling; sometimes the whole tube is treated with a patent rust-preventing process, known as Coslettizing, prior to enameling. Black is still the popular finish.

The size of the tires is being steadily increased, but few of our makers copy the wise Hendee lead of combining 28-in. wheels with a low frame, although a 28-in. wheel is more comfortable on rough roads; 26-in. remains the standard wheel diameter, but the cross section of tires is being raised. Last year 2¼-in. tires were standard; this year we see 2¾-in., 2½-in., and even 3-in. commonly fitted, usually with a butt-ended tube, and rubber-studded tread.

Prices Going Up.

MACHINES are not listed complete with horn, lamp and speedometer, such accessories being left to individual taste, though the concluding pages of most catalogs quote for fittings suited to the machine. Prices are rising, rather than falling, owing to the inclusion of free engines and variable gears. A complete roadster specification of high class costs nearly 300 dollars. There is a distinct increase in the number of small twin-cylinder machines, averaging from 2¼ to 3 h., as the prevalence of three-speed gears has made a reduced engine power able to cope with stern traveling; but the cognoscenti mostly eschew the tiny engines (with a few exceptions), as their light construction does not permit of so high a standard of efficiency or of power maintenance. The big twins of 5-8 h. are losing ground rapidly, and most riders make their choice between a 350cc. twin and a 500cc. single. These machines are far more handy and docile in ordinary use than a heavy overpowered twin, and are actually more manageable on precipitous hills and bad roads, for their low gear ratios make them quite as good climbers as a 9 h., while their lower speed and light weight are suitable for trick riding round stony hairpin bends.

F. A. M. MEMBER 19,000.

BUENAVENTURA CARBO, the American Vice and Deputy Consul at Cienfuegos, Cuba, received F. A. M. No. 19,000 on November 15.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.
5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.

6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.

7. At least one dollar will be paid for every suggestion published.

8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

Competitors in the Motorcycle Improvement Contest, and prospective contributors should note that the last improvement suggestions will be received for publication in the issue of December 26, and that the announcement of prize winners will be made in the following issue, that of January 9. Communications and drawings, to be eligible for consideration, must be in this office not later than December 20, so that they may be judged with the final suggestions to be published in the December 26 number.

PRE-HEATING DEVICE.

THERE are many advantages in pre-heating the mixture before it enters the cylinder of the motor, and in air-cooled motors the exhaust is usually by passed into a jacket surrounding the mixing chamber. A suggestion is here made in which the same effect is obtained by the fitting of a passage over the head of the cylinder, the carbureter being mounted at one end of the passage and the other communicating with the valve chamber. C is the carbureter, having a needle-valve

opening directly into the passage S; V is the valve chamber and A and E the inlet and exhaust valves respectively. The piston is shown at J, and P is the combustion chamber. The heat from the cylinder head, pre-heats the mixture as it goes through the passage. Contributed by H. G. Rhoads, Akron, Ohio.

TUBE MANIFOLD AND HANGER.

THE brace tube is suggested as being made in three parts, the middle to form the inlet manifold for a twin motor. This is shown at E and has plugs H at its ends. From each end of E are short pipes F, F, which are fitted to the valve chambers, while the carbureter is connected at G. The whole section

of the tube is connected by a pair of threaded collars to the other sections of the brace tube. The down tube C has a U-shaped cradle J in which the motor-base rests by means of four feet, two on each side. This piece is shown at D in the side view. Contributed by Derlin A. McKindless, Baltimore, Md.

SAFETY DEVICE.

TO the clutch lever is fitted a rod whose other end runs through guides along the rear fork of the motorcycle. The end of

the stand arm has an eye formed on it and the rod end passes through this eye and fits in a clip as shown. When the clutch lever is "out" the stand can be lowered, but when "in" it cannot be lowered. A padlock fitted in a hole in the clutch quadrant will lock the whole device in the position shown, and the machine can only be carried away bodily, as it cannot be taken off the stand. Contributed by John Hessler, Paulding, Ohio.

SAFETY THROTTLE.

TO prevent unauthorized use of a motorcycle, an auxiliary throttle is suggested. The inlet pipe is drilled through and the butterfly throttle A fitted therein, on a bent stem B. A spring C holds the throttle in either the open or closed position. D is the carburetor, E the inlet valve and F the cylinder. When leaving the machine, throttle A is closed, and being put in an inconspicuous place will hardly be noticed. Any attempt to go off with the machine will be fruitless, until this throttle is opened. Contributed by Edward Miller, Chicago, Ill.

RAIN AND WINDSHIELD.

A COMBINED wind and rain shield which covers the rider from the knees to the chest is the subject of a suggestion herewith. AB is a brass rod attached to the end of the

canvas shield and clamped by nut and wing nut to the fork. C, D, E, F is a frame of brass tubing, fitted to the handlebars at C and F in a similar manner. The canvas B, A, L, D, E, N, M is hooked to the various corners of the frame C, D, E, F. K is a slot in extension of clamp B and takes one end of rod AB. To remove: slacken thumb nuts at C, F, B and M and lift

off rods AB at both forks. Roll up rods AB in canvas and fix roll to DE by rubber bands. Swing frame forward till it lies across front of handlebars. Tighten up nuts at C and F. Unfold in the reverse manner. Contributed by Alfred C. Houghton, Detroit, Mich.

CLUTCH OILING.

TO obviate stopping the machine and removing a grub-screw to oil a disc-type clutch, two screw-down grease cups should be fitted, one on the clutch body at opposite sides. The cups are to contain a light grease and it is only necessary to turn the covers slightly to inject the grease between the plates. Contributed by Eugene Coughlin, New York, N. Y.

NEW PRESIDENT NAMED.

AT the last meeting of the Salt Lake City Motorcycle Club, the resignation of president E. L. Hiteman, who is moving to San Francisco, was accepted and E. L. Claspill was pronounced his successor. It was also decided that the club's permanent headquarters will be at 22 South West Temple street.

ABOUT a dozen members of the Wichita (Kan.) Motorcycle Club recently held a Sunday run to Arkansas City and Winfield.

Harry Immel, Well-known Pittsburgh Racer, Who Will Become an Agent.

AN EVENTFUL TRIP

Constant Bumped a Mail-Box Post with Sidecar, but Made Repairs and Drove Home Safely.

MR. and Mrs. J. U. Constant, of Brooklyn, N. Y., with an Indian 2-speed and Indian sidecar, rode to the Hendee factory in Springfield, Mass., recently and stopped over on their return trip, for several hours as the guest of Mr. and Mrs. Oscar Hedstrom, at Portland. From Portland the Brooklyn speedster and his wife proceeded to their camp at Tylerville, Conn., which they reached at dusk. In the gathering darkness Constant did not see a wayside mail box, which had been placed just opposite the gate through which the camp is approached, and the sidecar struck the post head-on. The impact pulled the front wheel around and bent the forks and frame, but neither the rider or sidecar occupant was injured.

On the following morning Constant straightened the forks of the machine, but was obliged to give it such rough treatment that the fork was cracked at the crown. The start was made from Tylerville at 9 a. m. and between New Haven and Bridgeport the left side of the fork broke. Constant had sufficient confidence in the outfit, however, to proceed without repairs and he brought the sidecar through safely.

THRILLS ON DALLAS BOWL

THINGS are happening down in Dallas these days. Not long ago Richards and Mike Cafarello were coming down off the big bowl that was recently opened there, when Cafarello went down near the running board. Richards, who was still cutting out a terrific pace, struck the fallen racer and both wheels of his machine passed over Cafarello's neck. Officials rushed out, expecting that Mike had received his quietus, but he recovered consciousness inside five minutes and asked for a cigarette and a bottle of soda pop.

A COMBINATION CAP.

ONE of the latest articles of clothing for motorcyclists is a novelty cap with which a pair of goggles is combined. When the goggles are required, they drop down over the eyes comfortably, and when the rider wishes to dispense with them the cap is simply turned around until the goggles are in the back and they are then held up by a neat strap.

HELD RUN IN RAIN

DESPITE a heavy rain, members of the San Jose (Cal.) Motorcycle Club recently participated in a Sunday run to Modesto. For three Sundays in succession rain had interrupted the intended run and the riders finally decided to make it rain or shine.

IMPERIAL OUTING

Brooklyn Squad Enjoys Trip Into Wilds of Staten Island—Annual Smoker December 7.

BROOKLYN, N. Y.—The Imperial M. C. of this city, held its Fall run to Eltingville, Staten Island, on Sunday, November 10. A number of feminine enthusiasts accompanied the boys on their outing and assisted materially in making the program a success. Most of the fair riders occupied tandem seats and several made the run in sidecars. The riders left the clubhouse in a body, and after a leisurely run to Bay Ridge the trip to St. George was made by ferry. From St. George to Eltingville was an easy jaunt. After a duck dinner the club took up the homeward run, and aside from a puncture or two the trip was made without incident.

Those who participated in the outing were J. Behm and Miss F. Smith, Harry Wiggins, William Heide, Charles Miller, J. Fredericks and Miss D. Smith, J. Kraemer and Miss H. Lee, George Eckert, Henry Juenger and wife, William Pflieger and Miss J. Pflieger, J. K.

Meeks and Wife, C. Heide, William Marquiss and J. Bloch.

The Imperial club will hold its annual smoker in Rocco's Cleveland Hall, Brooklyn, on December 7, and arrangements have been about completed for an enjoyable program. William Heide heads a capable committee of arrangements, and the fact that the proceeds are to be devoted to furnishing the new quarters of the club has moved the committeemen to unusual activity. The present staff of the club is made up as follows: F. W. Hammond, president; J. L. Bien, secretary; John Golz, treasurer; Joseph Oswald, vice-president; William Heide, road captain. The committee in charge of plans for the smoker is made up as follows: William Heide, Albert Brown, William Marquiss and Joseph Oswald.

NEW MARYLAND ROAD.

A NEW stretch of road between Laurel and Beltsville, Md., five miles long, has been completed and has cut the distance from Washington to Laurel to about 20 miles. The road is now macadamized as far as Laurel, and it can easily be covered by motorcycle in 40 minutes.

QUESTIONS and ANSWERS

AT least half a dozen interesting letters, submitted in answer to the question: "Which is the most desirable location for the clutch on a belt-driven machine?" could not be considered by the editor of this department, because of the fact that they did not adhere to the query. Several of them went into the control problem and others romped off into equally inviting fields; they may be given publicity later under another head. The consensus of opinion in the letters judged appeared to be that the most desirable clutch location on a belt-driven machine is in the rear wheel.

The first prize went to Harry C. Sundgard, 4535 Mulberry street, Frankford (Philadelphia), Pa., and F. W. Hammil, of 3715 East Seventh street, Kansas City, Mo., was awarded the second prize. Honorable mention is given the answer of N. H. Bedard, of Stockton, Mass. It should be kept in mind that the awards are based simply upon the best letters received and that the editor of this department does not stand responsible for the opinions advanced.

The series of contests now being conducted in this department will close with the issue of December 26, and announcement of the final winners will be made in the next issue, that of January 9. Contributors should submit answers to each question as soon as possible after its first appearance so that the work of judging and awarding prizes may be facilitated. All answers, and communications referring to the contests, should be addressed to: "Editor Questions and Answers, Motorcycle Illustrated, 51 Chambers street, New York."

Below are given question No. 10, that for which answers are now being received, and the new question, No. 11. Prize winners for No. 10 will be announced in the next issue.

Question No. 10. Which is the better method of fitting valves, grinding or trueing?

Question No. 11. Why are the cylinders of a twin motor fitted at an angle?

FRANK

MERRITT

LOCATING THE CLUTCH.

(Question No. 9.)

IN the answers to contest No. 9—"Which is the most desirable location for the clutch on a belt-driven machine?"—that of Harry C. Sundgard, of 4535 Mulberry street, Frankford (Phila.) Pa., has been awarded the first prize, while the second goes to F. W. Hammil, 3715 East 7th street, Kansas City, Mo. Sundgard's answer is as follows:

"There are two positions for the clutch on a belt-driven machine, viz., either in the engine pulley or in the rear wheel, and the final choice depends on the point of view of the manufacturer or the user.

"From the manufacturer's point of view the engine pulley location is the best on account of its lower cost and freedom from complicated parts. The rear wheel location demands the use of a separate wheel to carry the belt rim, the clutch being built into the hub of this extra wheel, which must also run on bearings of its own. All this costs money and it is easy to see why the first position is the one chosen by the greater part of the manufacturers.

"The user's choice hinges on the convenience of the device and its ability to stand up. The engine pulley clutch is naturally restricted to the size of the pulley. There can be very little difference in the size of this clutch, whether it is called upon to transmit four horsepower or seven. Again, the small clutch will give a quicker and, therefore, a more harsh engagement and must be 'urged' to keep

from stalling the engine in starting. On the other hand, the rear wheel clutch may be as large as the wheel itself if necessary and surface can be enlarged to meet the demands of increased horsepower. Also the larger clutch will have an easier engagement and make a much better showing in starting. This point is particularly noticeable on tandem or sidecar mounts. Finally the large clutch will stand up better than the small one, owing to its large surface. It would seem then that the rear wheel clutch should be the user's choice."

Second Prize Winner.

Hammil submitted the following answer:

"In the belt-driven type of motorcycle there are two points at which the clutch can be placed; i. e., on the motor-shaft, or on the rear wheel (as used on the Excelsior and Harley-Davidson, respectively).

"Careful consideration of these two points and their relative advantages indicates to the writer that the rear wheel position is the better, for reasons following: With clutch placed on the motor-shaft, the releasing of the clutch severs the connections between the pulley-shaft and the rim of the pulley, and the belt, small pulley and rear wheel are all stationary. In engaging the clutch the engine has to overcome not only the inertia of the entire machine, but the inertia of the small pulley and the belt. Where the clutch is in the rear wheel, there is only the inertia of the machine to overcome, the engine pulley and belt being already in motion, and the power of the engine is more easily transmitted to the rear wheel. Also, as both pulleys are

always in motion, there can be no slipping and consequently burning of the belt and lagging, as is liable to happen when the small engine pulley engages with the clutch placed in it.

"Another point in favor of the rear wheel clutch is the greatly increased clutch area, allowing of a more gradual engaging of the clutch, and renders a stalled engine unlikely."

Honorable mention is given to N. H. Bedard, of Stockton, Kan., whose contribution follows:

"The most desirable location for a clutch on a belt-driven motorcycle should be a comparatively easy question to answer. It should be decided the same as a rider would decide upon which is the best motorcycle, the best postage stamp or the best ten dollar bill. There are seven or eight strictly first-class motorcycles on the American market and the rider who would venture to say that any one was the best would be stating a fact so far as his own personal opinion was concerned, but it would not be a fact in the opinion of a very large percentage of the riders.

"Likewise, there are two excellent locations for the free engine clutch, one is on the engine shaft and the other in the rear wheel. Both are giving perfect service and each has its advantages over the other. It would be unfair to make a general statement that one was more desirable than the other, because that would be a personal opinion, and would be contrary to the ideas of thousands of good, sound thinking riders. Both of these locations are good; in fact, they are ideal. and it

is purely a matter of choice of the individual rider to determine which is the more desirable in his case.

"If this question should include the two-speed in connection with the clutch it would then be a very one-sided question and an easy one to answer in favor of the rear wheel location. It is to be regretted that the American manufacturers have given so little attention to the development of the practicable two-speed and the improvement of the present belt transmissions, both of which admit great possibilities."

STORAGE BATTERIES.

H. DE LANDER.—Storage batteries suitable for your purpose are made by the Pennsylvania Storage Battery Co., 221 North 23d street, Philadelphia, Pa., and the Willard Storage Battery Co., Marquette road, Cleveland, Ohio. For information on electric lighting, we refer you to an article by Wm. Hetherington, Jr., page 44, issue of October 3.

F. N. MOTORCYCLES.

V. DEMIANOFF.—The F. N. motorcycles are made by the Fabrique Nationale d'Armes de Guerre, Herstal-lez-Liège, Belgium. The American F. N. Company, of Newtonville Station, Boston, Mass., are the American agents.

PORTLAND'S POOR STREETS.

MOTORCYCLISTS living in the suburbs of Portland, Ore., have some bad roads to contend with as is proved by the accompanying picture of Chesley Soules, a messenger who uses a Thor 4 for business purposes. Soules rides his machine all the year round, and averages from 50 to 90 miles a day. He has ridden seven machines, all different makes, since taking to the motorcycle and is now convinced that the Thor will meet his requirements. Ten other passengers in

the employ of the City Messenger and Delivery Company, connected with the Postal Telegraph Company, also ride Thor machines.

SIDECAR QUERIES.

EARLE P. Chamberlain.—(1) We doubt whether it would pay you to use the single machine with clutch only for sidecar work in the section in which you purpose driving it. It would carry you and passenger up ordinary grades with a little clutch manipulation or none at all, unless sand was encountered, but on steep hills the passenger would probably have to walk. (2) If not properly attached the strain on the motorcycle will be great, and breakage may result; line up the sidecar as given in the "Tips and Topics" section, etc., in these columns recently. Most frames are not built for sidecar attachment, but stand up finely, showing the high grade of material and good design in them. (3) It varies from 30 to 36 inches. (4) If properly attached, a side-car outfit can be easily controlled on muddy or rutty roads, after the trick has been learned. There is often less tendency to side-slip than with the machine alone. (5) A noticeable difference, but not one that is serious. When there is no load, steering is more difficult, but a little practice will enable the rider to unconsciously drive allowing for the difference in behavior between the loaded and empty car. (6) Use a 5¼ or 5½ to 1 gear rather than a 6 to 1. The latter may cause the motor to overheat.

KEWANEE TO HELENA, ARK.

W. M. HOFFMAN.—From Kewanee go to Galesburg via Galva and Wataga, 37.7 miles; good roads, with a little gravel. From Galesburg go next to Peoria, via Knoxville, Gilson, Maquon, Middle Grove and Framington, 53.6 miles; fair country roads. From Peoria go on through Mackinaw, Lilly, Danvers, Bloomington, Gillum, Farmer City, Mansfield, Mahomet to Champaign, 98 miles over country roads. From Champaign go to Indianapolis via route 206 (Spring Touring Number) reversed, 137.7 miles. From Indianapolis take route 211 to Louisville, Ky., 125 miles. From Louisville take route 140 to Mammoth Cave, then route 313 reversed to Nashville, Tenn.

From Nashville go to Sheffield, Ala., via route 314, distance 119.7 miles and rough and heavy roads. From Sheffield, Ala., take route 311 reversed to Memphis, Tenn. The distance is 161.7 miles and the roads rough. All through this section rough and poor roads are encountered. From Memphis go to Lynchburg, Miss., then to Walls Station, Glover, Lake Cormorant, Clacks, Robinsonville, Hollywood, Tunica, Trotters Landing, and there take ferry to Helena, Ark. The distance is 62.6 miles and the roads very indifferent.

THREE-SPEED GEARS.

CENTRAL AUTO SUPPLY CO.—The three-speed gear mentioned in our issue of October 31 is the Armstrong, made by the Armstrong Three-Speed Gear Works, Icknield street, Birmingham, England. It is not as yet made for larger motors than four horsepower.

ADDRESSES WANTED.

THE Questions and Answers Editor desires the addresses of R. C. Newman, of Chicago, Ill.; also that of "E. L. B., Blank, Pa." It is requested that contributors use their home or business address on all letters sent to this and other departments. Many of those who contribute neglect this.

AN ALTOONA BOOSTER.

W. UNGER, the subject of the accompanying photograph, is employed by the Altoona (Pa.) Water Department and on many

occasions he is called upon to make emergency trips to outlying points. Under these conditions a rapid and economical means of "getting on the job" was necessary and Unger solves the problem by using a 6 h. Flying Merkel machine. Some of Unger's hurry trips are made at night, but he has never been obliged to leave his motorcycle behind, and it follows naturally that he is a booster of the first grade.

LEVEL TOO HIGH.

G. R. EWALT.—The level of the gasoline in the float chamber is too high, we think, and you would do well to change it. Bend down the float lever to change the level, so that the float will not stand so high when the float valve seats. It may possibly be that the valve needs regrinding also. Try new adjustments immediately after making the change of level and clean out the gasoline passage to the float chamber. See the Motorcycle Manual.

B. & C. TWO-SPEED.

S. J. N.—Write Bushnell & Cannon, 1268 East 80th street, Cleveland, Ohio, for information on the B. & C. two-speed gear.

WELLS IS DELEGATE.

W. H. WELLS, manager of the London (Eng.) branch of The Hendee Manufacturing Co., has been appointed a delegate to represent the Federation of American Motorcyclists at the conference scheduled during the week of the Olympia motorcycle show, to consider the advisability of reviving the defunct International Motorcycle Federation. Mr. Wells attended the F. A. M. convention at Columbus, O., last summer as the ambassador of the Auto-Cycle Union, of Great Britain, the national motorcycle governing body of that country.

MR. AND MRS. C. C. BARNHART, of Colorado Springs, recently completed a motorcycle trip from their home to Erie, Kan.

AMONG THE CLUBS

MOTORCYCLE COURIERS

Members of Brooklyn Club Assisted Mercury A. C. by Collecting Bulletins on Marathon Runners.

BROOKLYN, N. Y.—Motorcycle couriers were used in connection with the annual road race of the Mercury Athletic Club, of Yonkers, on Thanksgiving Day. The course is laid out so that the runners travel 16 miles through the countryside and the remainder of the race is run on the Empire City track. In order to keep in touch with the contestants so that their positions might be announced from time to time at the track, the club called the motorcyclists into action and solved the problem satisfactorily. In addition to acting as couriers the motorcyclists were supplied with first-aid appliances so that they could assist runners who collapsed or were otherwise in need of help.

The band of motorcycle messengers was in charge of William Hetherington, Jr., and Clarence D. Morgan, of the Linden M. C., of Brooklyn. At the close of the race the motorcyclists were the guests of the Mercury club committee at a dinner.

WASHINGTON NOTES.

WASHINGTON, D. C.—The National Capital Motorcycle Club is out after high honors. It aspires to lead the inaugural parade when Woodrow Wilson assumes the office of President on March 4. Steps have already been taken to interest influential local

men in the plan, as well as the police authorities. H. B. Cohen, treasurer of the club, will go to New York City in a short time to call on the officers of the National Democratic Committee, especially Chairman McCombs, and lay the plan before them.

THE National Capital Motorcycle Club, through a committee named for the purpose, had a meeting a few days ago with the Board of Examiners for the municipality of Washington, to take up the question of permitting motorcycles with passenger carriers attached to operate in the city. A sample machine, fitted with the additional seat, was submitted for inspection. It was argued by the committee that this machine was absolutely safe and that no real objection to its use could be made. At present a machine with a carrier attachment is not permitted. The Board of Examiners promised to consider the matter carefully.

ANNUAL FEAST.

BALTIMORE, Md.—The Maryland M. C. riders mounted their machines on Sunday, November 17, and went down to a nearby shore where their annual oyster roast was served.

Nelson Johnson has so increased his lead in the race for the diamond medal for attendance at club runs that he is practically assured of winning it.

MORE than thirty motorcyclists of South Bend, Elkhart and LaPorte, Ind., participated in a run to Gary recently, where a turkey dinner was served.

INVINCIBLE OFFICERS

Prominent Brooklyn Squad Names New Staff and Lays Plans for 1913—Series of Winter Programs.

AT the last meeting of the Invincible M. C., of Brooklyn, N. Y., the following officers were elected: M. M. Aiken, president; L. N. Vine, vice-president; W. H. Washburn, secretary; D. R. Thompson, treasurer; J. C. Fawcett, captain; O. P. Warlick, F. H. Chase, Robert Graves, James French and H. E. Stout, members of the Board of Governors.

Plans for the 1913 season were discussed and the club announced its intention to participate even more actively in runs and competitive events during 1913 than it has for 1912, despite the fact that the last summer was a busy one for the squad. Prizes are to be offered for regular attendance at club runs during 1913, and there will be numerous other features to keep the boys keyed up to a high pitch of enthusiasm. A series of winter entertainments is now about to be started.

MARYLAND CLUB PROTESTS.

BALTIMORE, Md.—The Maryland M. C. has taken cognizance of the growing fad of roller skating in this city. At its last meeting the members sent a letter to the Police Board calling attention to the fact that such great numbers of children throng the main thoroughfares during the afternoon and evening that it is dangerous for the motorcyclists to venture forth on a spin. The suggestion is made that some side streets be set aside for roller skating.

NEW JERSEY RUN.

A. AND P. BOSHEN, S. Eberhardt, L. Benedict, G. Riechey, Fred Cordes, W. Allen, Howard Hill, C. McMyrtle and B. Mathewson, of the New Jersey M. C., participated in a Sunday run to Whitehouse, N. J., on November 17. A chicken dinner was enjoyed and it was unanimously agreed to hold a similar run New Year's Day.

PENSACOLA ACTIVITY.

WORD comes from the Pensacola (Fla.) Motorcycle Club, which was recently organized with 25 members, that the outlook in that city is very promising. E. C. Hinman, Indian agent, has contracted for fifty 1913 models and already has buyers for ten. Practically every machine on the market is represented in this field.

A NORFOLK OUTING.

TWENTY members of the Twin City Motorcycle Club, of Norfolk, Va., recently participated in a sociability run to Elizabeth City, N. C.

A Representative Turn-Out of Members of the Colonial Touring Club, of New York, at Grant's Tomb, Watching the Recent Battleship Review.

Colonial Touring Club Riders Escorting Sidecar Crew on a Recent Outing.

FROM THE F. A. M. FORGE.

L. W. LUDDEN, of 11 North Main street, Brockton, was recently appointed State F. A. M. Commissioner for Massachusetts. Local F. A. M. commissioner appointments in Ohio have been made as follows: R. S. McConnell, 3 Wick Building, Cleveland, for Cuyahoga County; William J. O'Shea, 145 Michigan street, Toledo, for Lucas County; Walter Robb, c/o George W. Mills, Canal Dover, for Tuscarawas County, and E. A. Falknor, of Kessler's Station, for West Milton and vicinity. Allen B. Lewis, of Kittery Depot, Me., is also a local appointee.

The repair shop of Clark Sturtz, 33 South Fifth street, Zanesville, Ohio, recently received the sign of the F. A. M.

A "GET-TOGETHER" SESSION.

A GET-TOGETHER session precedent to the formal organization of the Riverside Motorcycle Club of Greater New York will be held in the club rooms at the Riverside Motorcycle garage, 533 W. 110th street, New York City, Saturday evening, December 28th. A dinner, with accessories, will be served, and an otherwise interesting program is being arranged. Every motorcycle dealer and rider in Greater New York is invited to attend, and it is hoped to make this gathering one of the largest of its kind ever held in this city.

SOUTHERN APPOINTMENTS.

T. E. SPOTTSWOOD, JR., of 461 Dauphin street, Mobile, Ala., has been appointed local F. A. M. commissioner for Mobile County, and T. L. Chase, of Hurley, N. M., has been appointed local commissioner for his district.

SOCIAL meetings to be held every other Wednesday evening in the quarters of the National Capital M. C., of Washington, have been started and are proving very successful. Refreshments are served and there is usually a smoker. The National Capital Club now has a membership of about 100.

A WEEK'S REGISTRATIONS.

THE following repair shops were registered with the F. A. M. during the week ending November 16: Gartin Cycle & Auto Com-

pany (B. A. Gartin), Third and Ruby streets, Ellensburg, Wash.; The Best Motor & Cycle Company (John Hohl), 37 West Jefferson street, Phoenix, Ariz.; Walthour Motorcycle Company, Inc. (R. E. Walthour), 1714 Third avenue, Birmingham, Ala.; and the Motorcycle Equipment & Repair Company, conducted by S. M. Saunders, C. D. Bohannon and Richard Dymond, at 727 Common street, New Orleans, La.

CLUB'S RAPID GROWTH.

PRESIDENT SHANNON, of the Atlantic City (N. J.) Motorcycle club, reports a gain in membership of fifty per cent. during the last year. Members of the club will participate in a run to Weymouth, N. J., on December 1.

ARROW CLUB OFFICERS.

AT the first annual meeting of the Arrow Motorcycle Club, of Jersey City, N. J., the following officers were elected: Leo Herzig, president; Ernest Meier, vice-president; George Strohsahl, secretary and treasurer; Paul Klaar, sergeant-at-arms, and Edward Bissinger, road-captain.

ECONOMY WITH THE TANDEM.

R. L. MILLER, of West Lafayette, Ind., states that a short time ago, he covered eighty-four miles on one gallon of gasoline, with a passenger on the tandem seat of his Yale twin. At another time, Miller states, the two made a trip of fifty-five miles over roads that were muddy, and only five pints of gasoline were used.

A RECENT hill-climbing contest held by the Springfield (Ohio) Motorcycle Club drew a large crowd and proved unusually interesting.

ROY SULLIVAN, of Charleston, S. C., won the motorcycle race held in connection with the Orangeburg (S. C.) Fair.

F. G. KEEGAN, of Globe, Ariz., in order to win a wager, is riding his motorcycle from his home to Reno, Nev.

A NUMBER of motorcyclists of Altoona, Pa., recently participated in a Sunday run to Roaring Spring.

PRINCE'S ENDORSEMENT

President Patterson Forwards Letter Telling Veteran Track Builder He Has O. K. of Federation.

IN keeping with the action of the F. A. M. Board of Directors at the recent special meeting in St. Louis, President Patterson has forwarded a letter to Jack Prince, the veteran track builder, informing him officially of the endorsement given him by the directorate. Prince had reason to believe that stories were being circulated in some quarters to the effect that he was in bad odor with the F. A. M., and he appeared at the St. Louis meeting to request that the F. A. M. officials make some sort of an announcement of his satisfactory standing in the national body. The board of directors assured him of their belief in his personal integrity and wished him luck. Later President Patterson sent him a copy of the following letter:

"It gives me great pleasure to advise you that at the meeting of the Board of Directors, held at St. Louis, on the ninth day of November, nineteen hundred and twelve, at this hotel, it was the unanimous sentiment of the Board of Directors that you are a reliable and competent builder of motorcycle tracks. You are a member of the F. A. M. in good standing and have been affiliated with us for many years. During all this time your dealings have been satisfactory, and you are entitled to our endorsement and best wishes. Nor is there any objection to your aiding in opening such tracks and giving the promoters the benefit of your long experience.

"This letter is written in accordance with the unanimous expression of the Board, and you are at liberty to make it public."

HILL-CLIMBING CONTEST.

A large crowd witnessed the recent hill-climbing contest under the auspices of the Springfield (Mass.) Motorcycle Club at the Snyder Hill, west of the city. There were 16 starters, all members of the local club, and 14 of them finished. Each of the riders covered a distance of about six-tenths of a mile from a standing start.

The following is the result of the climb: Wilkins, "5-35" Harley-Davidson, time 1:02; Grisso, 7 h. Harley-Davidson, time, 1:04; Horner, 5 h. Emblem, time, 1:05; Rhoades, 5 h. Indian, time, 1:07; Pence, 7 h. Excelsior, time, 1:09; Lubbers, 5 h. Indian, time, 1:10; Clark, 7 h. Indian, time, 1:10; Zeigler, 4 h. Harley-Davidson, time, 1:13; Scofield, 7 h. Indian, time, 1:14; Strong, 5 h. Emblem, time, 1:20; Hicks, 4 h. Indian, time, 1:22; Vull, 4 h. Emblem, time, 1:38; Dase, 4 h. Thor, time, 1:40; Hadley, 4 h. M. M., time, 2:03.

ROAD RACE WINNERS

LEO POWERS, riding a 4 h. single Excelsior, won the annual road race of the Des Moines M. C., and Phil Streit, riding a 7 h. twin Excelsior, took second honors.

CAMPLEJOHN THE VICTOR.

BERT CAMPLEJOHN was the winner of the recent road race of the Jacksonville (Fla.) Motorcycle Club, to Fernandina. This was the first event of its kind held by the southern club.

AT the last meeting of the Reading (Pa.) M. C. it was announced that the club's annual banquet will be held on December 6.

M & M ECONOMIZER.

ONE of the newest products to interest the thoughtful motorcyclist is the M & M Economizer, a device manufactured by the Moller Brothers Controller & Economizer Company, 700 Betz Building, Philadelphia, Pa. The Economizer is a fitting with one ground valve seat and six portholes, and is intended to admit auxiliary air above the carbureter, thus permitting of maximum efficiency from the fuel and more flexible running of the motor. The amount of air to be admitted is controlled by hand, and the gas coming from the carbureter is broken up and sprayed by the incoming air so that when it reaches the cylinder it is vaporized to the highest possible degree. In other words, the M & M Economizer is an adjunct to the carbureter, completing the work of that instrument.

The makers guarantee that the Economizer will increase the speed and pulling power of a motor 20 per cent; that it will mean a saving of 40 to 50 per cent. in gasoline and that it will greatly reduce carbonization trouble. The device acts as a safety valve in case of a back-fire, and it may also be used for priming purposes. The basis of the claim that carbon will not collect readily is apparent because of the fact that with the Economizer in service the motor is always running on the thinnest mixture that will deliver the power. The M & M device is attached by the aid of a 1/4-inch standard pipe tap, and is extremely simple both in fitting and operation.

MERZ SELLS THE YALE.

INDIANAPOLIS, Ind., Nov. 22.—A new agency in the ranks at Indianapolis is the Yale. John E. Merz, the live wire who is a leader in the new Indianapolis Motorcycle Club, has acquired the Yale agency for this city for the coming season and is confident that the "Big Y" will be strongly represented among Indianapolis riders in the future.

FARMERS WANT THEM**Demand for Motorcycle in Kansas Is Growing Rapidly and Most of the New Machines Are Going Into Rural Districts.**

THREE contracts, taken by T. A. Miller, of the sales department of the Harley-Davidson Motor Company, and signed by the Drouhard Brothers, of Kansas, call for the delivery of 310 machines, practically all of which will be sold to farmers. The Drouhard firm in Danville, Kan., a small town with a population of only 200, has contracted for 150 machines. The territory of this particular company is limited to five rural counties. One hundred machines will go to the Drouhard Motor Company, at Wichita, and 60 to Gene Drouhard, of Pratt.

Sanders Brothers, of 915 Race street, Cincinnati, and George Schroeder, of Davenport, Ia., will continue to handle Harley-Davidson products in their respective districts. The Alliance Motor Company, of Alliance, Ohio, has been given Stark County as territory. Louis E. Fluke, proprietor of the Harley-Davidson Sales Company, of Dayton, Bauman & Hines, of Richmond, Va., Frank J. Overstreet, of Kiowa, Kan., E. R. Allen, of Cherokee, Okla., and L. R. Heitz, of Muscatine, Ia., are also on the list of dealers figuring in recent contracts.

FORSTER NOW WITH MIAMI.

CAMERON FORSTER, who has had considerable experience on the road, has joined the staff of the Miami Cycle & Mfg. Co., Middletown, Ohio. He will be assistant sales manager of the Racycle and Hudson departments.

HOWARD A. FRENCH & CO., Indian agents in and around Washington, have ordered 100 Indians for 1913, of which fifteen have already been sold.

SPRING FOOTBOARDS.

NOVEL footboards and a somewhat original springing system, feature the machine shown in the diagram. It is the invention of an Englishman, who argues that the small side wheels would be welcomed by inexperienced riders, by women and elderly enthusiasts, as they could be pushed down to give additional bearings on the ground in an emergency, such as a side-slip. The drawing appeared in a recent issue of *Popular Mechanics*.

**QUEEN CITY PATENTS.**

THE Queen City Iron & Wire Works Company, of Denver, Col., which has been making luggage-carriers and tandem attachments for motorcycles in a small way for the last four years, has now perfected and placed on the market two rear seats which provide both luggage and tandem accommodations. Four applications for patents have been made and two have already been allowed. The company is convinced that it has a rapid seller, and is preparing to supply a wide demand. Seat No. 1 embraces many desirable features, such as enclosed coil springs, both up and down and forward and back, so that every precaution is taken to guard against the transmitting of road shocks. The seat also has an adjustable back-rest, which can be raised and lowered while the machine is in motion. It has folding foot-rests which are adjustable to suit the user.

Seat No. 2 is to be marketed at a lower price. It also has enclosed coil springs, which allow it about six inches of shock-absorbing action, and is on the whole a very comfortable seat. It also makes a first-class convertible luggage-carrier, and is produced to fit any standard motorcycle.

NEW MERKEL BOOMERS.

IN a recent bulletin from the Miami Cycle & Mfg. Company, the following new agencies are reported as having been closed during one week: The Edwards Cycle Company, for Minnesota; The Dominion Cycle Company, for Manitoba, Canada, and the Western Cycle & Motor Company, for Saskatchewan, Canada. The company will be represented in Nebraska and the western counties of Iowa, by the Nebraska Cycle Company. Norman E. Heil was also on the list, for Paterson, N. J. In New York State the Utica Cycle Company, of Utica; W. J. Caldwell, of Newburgh; The W. A. Doubleday Company, of Syracuse, and Neff & Malone, of Rochester, will handle Merkel machines in their respective cities.

AN OKLAHOMA AGENCY.

ANNOUNCEMENT is made by the Pope Motor & Cycle Company, of Oklahoma City, Okla., that new quarters have been opened where it will handle a full line of supplies together with the Pope line for 1913.

STURDY ENGLISH VAN.

FROM William L. White, 1129 Comox street, Vancouver, B. C., comes the interesting photograph reproduced herewith. It shows a striking view of the Omnium Motor Carrier, for which Mr. White is agent in western Canada. The agent states that the Omnium outfit has given excellent service and that there is

a rapidly growing demand for it, although it has been on the market only about a year. The Vancouver enthusiast was moved to send in the photograph by a perusal of D. R. Hobart's serial article on "The Successful Delivery Van," the final instalment of which appears in the last issue. The price of the standard Omnium is \$515, f. o. b. London, Eng.

JEFFERY-DEWITT EXTENSION.

THE Jeffery-Dewitt Company, of Detroit, manufacturers of the Reliance brand of spark plugs and the new J-D Visible plug, has been forced by increasing business to occupy new quarters in addition to its large original factory. Accordingly, a new site on the East Grand Boulevard, the greatest motor way of Detroit, has been chosen, and the entire assembling and shipping will be carried on, hereafter, at this plant, known as No. 2. The new building allows 6,000 additional feet of floor space.

MERKEL AGENCIES.

AS evidence that the 1913 Flying Merkel "looks good" to the dealer, the Miami folks point with proverbial pride to the manner in which they are lining up new agencies. Last week's harvest included the following: Norwich, Conn., Stebbins & Geynet; Hartford, Conn., W. T. Hayes; Chicago, Ill., Fred Huyck; Kewanee, Ill., Gilfillan Bros.; Evansville, Ind., Koch Outfitting Co.; Iowa City, Iowa, Paul W. Smith; Kiowa, Kansas, Benton & Ives; Wakefield, Kansas, H. A. Avery; Springfield, Mass., F. N. Coleman; Paterson, N. J., H. E. Heil; Naponach, N. Y., H. W. Justus; Hamburg, N. Y., John Seaten; Newburgh, N. Y.; W. J. Callwell; Syracuse, N. Y., W. A. Doubleday; Utica, N. Y., The Utica Cycle Co.; Brooklyn, N. Y., John Pflieger; Sidney, Ohio, Knupp Bros. Garage, Erie, Pa.

SPEAR'S EVENTFUL TRIP.

WILLIAM R. SPEAR, traveling representative of the R-S, has just returned from a very successful trip through New York State. Starting in October he visited practically every city and town in the State, and ran over all kinds of roads, not the least interesting of which were met with between Auburn and Seneca Falls, and near Watkins Glen. Over 1,600 miles were covered, with only two punctures, due to broken bottles. The following agents among others for the R-S product have been appointed: Saratoga Springs, C. J. Church & Son; Binghamton, W. A. Merrill; Cortland, Daymor & Mead; Hornell, C. E. Burdett; Salamanca, Niles Razor Works; Utica, Otto L. Endres; Rome, Fred Strowbridge; Ilion, Robert Thompson

UNCLE SAM WANTS BIDS**Postal Authorities Will Receive Rental Propositions Covering Twenty-five Motorcycles for Regular Service.**

WASHINGTON, D. C.—The recent motorcycle tests made by Postmaster Merritt, under the direction of Dr. C. P. Grandfield, first assistant postmaster-general, in connection with the city mail delivery and collection service, proved so satisfactory that Dr. Grandfield has ordered sealed proposals to be received until 2 p. m., December 12, 1912, for the rental of "25 motor vehicles, with three wheels, to be used by letter carriers in the delivery and collection of mail during the period from February 1, 1913, to June 30, 1916."

In discussing the recent tests Dr. Grandfield said that he had satisfied himself that there is a very wide field to be filled by motorcycles in the postal service, and that he is anxious to give them a thorough test. The plan of renting twenty-five vehicles, equipped according to special specifications furnished, was decided upon. It is possible that during the contract term the number of vehicles to be rented may be materially increased. A number of cities throughout the country will be designated in which the motorcycles will be used, not less than five being sent to any one city. This would indicate that the machines will be tried out in five cities at first.

Two new styles of letter boxes have been adopted by the department for use in connection with the collection of mail by motorcycles. Both open in front, instead of at the end. From one of them the mail is swept into the receptacle on the vehicle with the hand; in other words, scooped up and out. In the other the mail is dumped out into the motorcycle van by the tilting of the street receptacle. The specifications, among other things, require that contractors shall provide for instructing the carriers in the operation of the vehicles, and that contractors shall pay all expenses of operation, maintenance and repair, including licenses, fees or other charges required by laws and ordinances.

A blank form of proposal will be furnished on application to prospective bidders. The machines must be equipped with a suitable weatherproof box, of sufficient capacity to

hold 400 pounds of mail, with a door on each side into which the mail may be dumped from drop-bottom street letter boxes without the carriers dismounting from the vehicles.

TOLEDO FIRM INCORPORATES.

THE Toledo Sporting Goods Co., 1006 Monroe avenue, Toledo, O., considerably enlarged its scope recently when it became a corporation with \$10,000 capital. A. D. Rivers, who has always been the leading spirit in the concern, is president, and Charles R. Miller, for many years superintendent of the Miami Cycle & Mfg. Co., at Middletown, O., is secretary and treasurer. The company will sell Flying Merkel motorcycles in Toledo and northwestern Ohio.

AGENT FOR THREE STATES.

AN announcement of considerable importance was made this week, to the effect that Hans Johnson, of Dallas, Texas, has arranged to sell Flying Merkel motorcycles in Texas, Louisiana and Oklahoma. Johnson already handles the Miami line of bicycles in this territory, but heretofore he has not stocked motorcycles.

A HENDEE WARNING

OWING to the fact that some designers have shown a tendency to follow the lines of the Indian cradle spring fork too closely, the Hendee Manufacturing Company, through its patent attorneys, has given notice that patents are pending on the cradle spring fork construction and that infringers will be prosecuted vigorously.

HAZLETON HANDLES YALE.

E. P. HAZLETON has taken the 1913 agency in Washington for the Yale. He has long been in the bicycle business here and has sold motorcycles as a side issue, but he expects to give much attention to the latter machine from now on.

IN NEW QUARTERS.

THE Bidwell-Conklin Company, formerly located at 2142 Broadway, New York City, has moved to new and more spacious quarters at 277 Lenox avenue.

At the Left is Shown the Nilmelior Alterno Magneto, Specially Designed for 90-Degree Twin Motors, and Used on English Cyclecars; at the Right, the Detachable Front Mudguard on the New English Hudson.

NEWARK TRACK SOLD FOR \$9,500

NEWARK, N. J., November 25.—When the Vailsburg board track was offered at public auction this afternoon to satisfy a claim of the contractors who built it William Girth, of Vailsburg, became the owner, his bid being \$9,500. The track was erected by Zacker & Kurhl, Newark contractors, and their claim amounted to \$10,695.20.

Otto Zacker, of the contracting firm, opened the bidding with an offer of \$5,000; Mr. Cross, one of the owners of the motordrome, made

a bid of \$6,000 and Girth increased it to \$9,500. The purchase price covers the six racing machines used on the track last summer, as well as other incidental fittings.

There is much speculation as to what the new owner intends to do with the track, and it is strongly hinted that arrangements will be made to hold motorcycle races next year with certain restrictions, to be approved by the authorities. Paul Derkum, erstwhile manager of the track, is in Los Angeles.

YALE BOOSTERS MEET.

AT a meeting of the sales force of the Consolidated Manufacturing Company, held Friday, November 22, the present national advertising campaign of the company came in for attention, and the reports submitted relative to results already achieved were highly encouraging. The object was to ascertain the practical effects of the campaign and to lay plans for its continuance, in even a broader sense. Those present at the meeting were: D. J. Welsh, general manager; Robert Hinds, sales manager; Eastern Sales Manager F. C. Cornish; Baird, Capron and Squier of the "Flying Squad"; James A. Campbell, of the traveling force, and L. F. McManus, advertising counsel. The Flying Squad riders, who have been in close contact with the agents, were enthusiastic over the outlook.

ON EUROPEAN TRIP.

CHARLES GUSTAFSON, SR., chief of the experimental department of The Hendee Manufacturing Co., sailed from New York for Europe on the American liner *St. Paul*, Saturday, November 16. He will visit the Olympia motorcycle show which opened in London November 25, and during his stay in Great Britain he will be the guest of W. H. Wells, manager of the Indian London branch. Later Mr. Gustafson will renew acquaintance with his birthplace in Sweden, which he has not visited in 18 years. He will return to America in ample season for the New York motorcycle show.

SATISFACTORY SERVICE

AMONG the motor fitments to give a good account of themselves in the recent Angel City Motorcycle Club endurance run, from Los Angeles, Cal., over a 1,124-mile course, were Hagstrom spark plugs, which are reported by Clarence Biggs, James Leonette, S. T. Clark and N. H. Redfield as having given them highly satisfactory service.

READING-STANDARD AGENT

F. H. VAN DUSEN, of Port Richmond, Staten Island, N. Y., recently contracted for the agency for the Reading-Standard in this locality.

CHICAGO M. C. PLANS ROAD CLASSIC

MOVEMENT for a national road race for motorcycles, similar to the Elgin national road race for automobiles, has been taken up by the Chicago Motorcycle Club and expressions of sentiment are being obtained from manufacturers and well-known riders, with a view to ascertaining how the event would be received. It is the belief of the club officials that such an event would awaken

new enthusiasm in the motorcycle field throughout the States. The Chicago Club desires to hold the program on July 4, 1913, and to run three events, one of 175 miles for 4 h. machines, one of 200 miles for 5 h. machines, and one of 250 miles for 7 h. machines. The idea is that these races would be run at the same time, the starts being made at half-minute intervals.

THE ATLAS GROWTH.

SO rapid has been the growth of 1913 business that the Atlas Specialty Manufacturing Company, of Chicago, has found it necessary to increase its floor space by 35,000 square feet. The company has also installed considerable new machinery, and is now prepared to meet all demands for its products. Orders for 1913 have set a new mark during the last three weeks.

FLYING MERKEL AGENTS.

A NUMBER of important changes and additions in its rapidly growing list of 1913 Flying Merkel agents were announced by the Miami Cycle & Mfg. Co., of Middletown, Ohio, this week. Harwood & Minton is the name of a new firm just formed in Nashville, Tenn., that will go after business on a large scale, and handle Flying Merkel motorcycles and bicycles and other Miami products. Thurman Constable, well known in the middle west as a successful dirt track rider, will sell the Flying Merkel in Union City and vicinity, and will also ride the "Yellow Pup" at dirt track meets.

The Nebraska Cycle Co., a large and prosperous concern of Omaha, Neb., will distribute Flying Merkel motorcycles and other Miami products in the State of Nebraska and in adjoining Iowa counties. Another newcomer is M. T. Gerrity, who will open a store and repair shop at Elmira, N. Y. He will handle Flying Merkel motorcycles and bicycles exclusively, and has already specified delivery for half a carload of machines.

MORE YALE CONTRACTS.

CONTRACTS have continued to flow into the Yale headquarters during the last week. A few of the last to be filed are from L. E. Phillips, Byhalia, O.; Osgood & Drackley, Boone, Ia.; R. W. Bechtel, Plain City, O.; L. M. Robertson, Ames, Ia.; the Syracuse Motor Co., Syracuse, N. Y. Another contract that carried with it an order for a large number of machines was that of the Buettner-Helm Company, East St. Louis, Ill.

TOURIST TROPHY WINNER

"WE have with us today" the first reproduction published in America of the winner of the English Tourist Trophy race, the English classic. The gentleman with the cigarette is M. F. A. Applebee, who piloted the Scott two-cycle to victory last July. Mr. Applebee ascribes his victory to a large extent to the perfect transmission service afforded by his Renold chains. His average time in covering the mountainous course of 187 miles was 48.69 miles per hour. The winners of the Junior T. T. and the Scottish trials were also equipped with Renold chains, for which Peter A. Frasse & Co., of 417 Canal street, New York, are the United States distributors.

SIEMENS BROTHERS & CO., LTD., the English manufacturers, have brought out a rather ingenious electric lamp for illuminating a route card or map in night riding. The case in which the dry cell for supplying the current is carried is fastened around the rider's waist.

THIS IS THE TIME TO BUY

Motorcycles and Automobiles

AT 1/4 to 1/3 THE PRICE WHEN NEW

We specialize in selling standard makes of motorcycles and automobiles in slightly used condition.

Large assortment of used motorcycles, single, two and four cylinders; chain, belt or shaft driven—Indian, Pierce, R-S, Excelsior, Curtiss, F. N., N. S. U., M. M., Harley-Davidson, Thor, New Era, Merkel and other high-grade makes from \$35 up.

Practically all styles and makes of automobiles at \$100 up.
We guarantee each purchase to be in perfect running condition.

Agents wanted everywhere.

ANNOUNCEMENT

A Motorcycle Coaster Brake That Is Strong Enough to Hold an Automobile

For some time past the motorcycle trade has felt the need of a coaster and braking device of sufficient power, strength and efficiency to give the rider control of high-powered machines.

The 1913 New Departure will do this and then some. It doesn't require much effort by the average rider to exert a back-peddalling pressure of 75 pounds. In this new model such a pressure will give A BRAKING FORCE OF

MODEL L

1913 New Departure Motorcycle
Coaster Brake for Belt Drive Machines

ONE AND ONE HALF TONS in the rear hub—a power sufficient to stop an automobile.

The action is positive. There is no possibility of locking. The mechanism is heavy—stronger than necessary.

Every motorcycle expert who has seen it says it is the ideal brake—just what rider and manufacturer have been waiting for. Fully described in new catalog, send for your copy today.

When You Do Get A
Sidecar Get The
BAXTER

The powerful 1913 motorcycles will make it possible for every rider to attach a sidecar to his machine, whether single or twin. When you buy a BAXTER SIDECAR you are assured that it is

**THE STRONGEST
THE LIGHTEST
THE MOST COMFORTABLE
SIDECAR IN THE WORLD**

Its chassis of seamless steel tubing, double truss frame construction and rigid mudguard give it enormous stability.

Yet so scientifically is the weight distributed that it has the lightest frame on the market. Then, too, the hub spindles, the most vulnerable points on a sidecar, are turned from solid Bessemer steel.

Comfort is assured by its tension spring absolutely absorbing all shocks, its deeply upholstered basket of India rattan and its racy English shape.

We make sidecars to specification. All parts quick detachable and can be furnished separately.

WRITE FOR OUR CATALOG.

BAXTER SIDECAR CO.
119 Broadway, Cambridge, Mass.

KOKOMO TIRES

KOKOMO TIRES represent the highest achievement in tire construction. Sixteen years of tire manufacturing experience are back of them, and the best, and only the best, of material and workmanship goes into their make up. The result, proven by many tests, is that Kokomo tires are

WHY DeLuxe MOTORCYCLE MOTORS EXCEL

BECAUSE OF THEIR

Simplified Design and Reduced Number of Parts

The solid type of construction as applied to the crank case and the crank shaft and the many other improvements bring about a very material reduction in the number of parts in our motors compared with other makes. This reduced number of parts, of course, means proportionately lessened possibilities for trouble.

Watch this space for more details of DeLuxe Motors.

Star Electric Co., 18 No. May St., Chicago, Ill.

Brown Scientific Non - Deflating Pneumatic Tube

AN AIR FILLED MOTORCYCLE TUBE POSSESSING VERY UNUSUAL FEATURES:

First: It withstands a tread puncture without deflating the tube.

Second: The higher the pressure the tighter the puncture closes.

Third: It eliminates the risk of destroying casings by reason of punctures.

Fourth: The danger of loss of control of machine is removed.

Fifth: It assures you of not being obliged to repair a puncture on the road and gets you "there and back" on full tires.

AIR FILLED ONLY

Punctures are self-closing by reason of a scientific but simple principle of construction.

**NO "DOPE," GUM, PASTE OR OTHER
STUFFING MATERIALS.**

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim. Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS

Clark Motorcycle Starter

A NEAT and compact attachment for the carbureter, that starts the engine without excessive pedaling, reduces carbureter trouble fifty per cent and cuts down the gasoline bill. A gasoline engine requires a richer mixture to start on than is needed after it is warmed up. Without the Clark Starter, it is necessary to open the needle valve more than is required to give efficient results after the engine is warmed up.

[Price, 75c. each]

Clark Acetylene Tank Brackets

Model "A" designed specially for Excelsior Motorcycles, fastens to the handle bar in a rigid position and does not allow the slightest movement or vibration of tank.

In setting tank into the brackets, an eccentric arm is pressed down and holds tank solid. No screws or bolts to tighten or loosen. Tank can be removed in a second by releasing eccentric arm. The tank in this position does not interfere with any other attachment on the machine. Furnished complete with steel bands and necessary bolts for attaching. State Model of Motorcycle when ordering.

PRICE—\$1.00 per plug

Our guarantee—"Your money back or a new plug, unless you are absolutely satisfied."

JEFFERY-DEWITT COMPANY

55 Butler Ave.

Detroit, Mich.

Made for Motorcycle Service Only

No need any longer to use the inferior mica plug or a makeshift porcelain. This new Motorcycle Standard Spark Plug, built by the greatest manufacturer of spark plugs in the world, gives motorcycle riders a plug with a porcelain insulator that is faultless, defies heat and insures perfect ignition.

Motorcycle Standard Spark Plug

Leading motorcycle engineers of the country have pronounced this plug right in principle and construction. The length over all is 2 1/4"—just the right size for the limited dimensions available for a spark plug in the motorcycle motor. The porcelain is made in our own potteries. Heat cannot crack it. The bushings are case hardened. The terminal nut will take ordinary wire, ring, or special "Indian" terminal.

1913 Agencies Open

Our factory facilities have been increased so that now we can care for many times the business we had in 1912. Those dealers, as our competitors, who were disappointed in the machines they sold should look into the merits of

The P. E. M.

The 1913 Models are marvels of mechanical perfection—and any dealer will be proud to sell them. In this small space we can't tell of the features of these new machines, but if you are interested write today for specifications and dealers' special proposition for 1913.

WAVERLEY MFG. CO., Waverley Pl., JEFFERSON, WIS.

INSURE A GOOD COMPRESSION—ALWAYS

It is important, if you want all the power your motor generates, to keep your valves in condition. An occasional grinding keeps your compression at its most effective point. For cleaning and grinding your valves the

Simplex Exhaust Valve Remover

is the only tool that can be made to readily fit all machines. It is the most convenient little appliance on the market—a repair shop necessity.

PRICE 50c.

Liberal discounts to jobbers and dealers. We also make the famous Simplex Side Cars and the Simplex Magneto Cut-out. Write for our booklet.

The Neverout Gas Lighting Outfit

TRADE MARK

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

For sale by leading dealers. Made only by

FOR SALE.—1912 Indian twin with Simplex tandem and No. 5 Cavalry saddle; run 400 miles; must sell at once as I am going to California; \$200; George Fruit, Oregon, Ill.

MOTORCYCLES CHEAP.—Every machine in stock must be sold this month; need room for 1913 models. Write for list No. A 26. American Motor Co., 2724 Michigan avenue, Chicago, Ill.

WILL EXCHANGE.—Model A Maxwell Runabout, new tires, perfect condition, for Indian twin, 7 h., and \$25 cash. J. Eblen, 70 Peachtree street, Atlanta, Ga.

WANTED TO BUY 1912 motorcycle; give description and price. E. Patterson, 3976 Winshire street, Pittsburgh, Pa.

FOR SALE.—Stewart (motorcycle) speedometer, head and tail lamp, Prest-O-Lite tank. Everything like new. Write Aaron Ehresman, Gridley, Ill.

FOR SALE.—1911 Excelsior twin, Eclipse clutch, Herz magneto, luggage carrier, guaranteed perfect shape; \$90 cash. Eblen, 25 Whitehall Terrace, Atlanta, Ga.

FOR SALE.—1912 red, 7 h. two speed Indian; excellent condition; \$225. "Jot," 888 State street, Springfield, Mass.

MOTORCYCLE ENGINE from 4 to 7 h.; must be in good condition. Apply C. Caldwell, Lacombe, Alta., Canada.

ROYAL III. with new V-belt, band brake and tank; \$35 cash. Gleason, 16 Bellevue street, Worcester, Mass.

FOR SALE.—1912 Flying Merkel, 6 h., chain drive, twin-cylinder motorcycle. This is a brand new machine, never been out of store. First check for \$205 takes it. P. B. Retan & Son, Elmira, N. Y.

ANNUAL CLEARANCE SALE.—To close out used wheels I offer the following bargains: 1912 Harley-Davidson, \$235 model, with Presto tank and lamp, \$175; 1912 Harley-Davidson twin, \$285, \$200; 1912 Minneapolis, \$285, \$175; New Era, \$125; Curtiss, \$55; Reading-Standard, \$50. Full description upon application. Shipped on approval. Newport Motorcycle Agency, 3719 Thames street, Newport, R. I.

AGENTS WANTED

Motorcycle and bicycle agencies can make big money during dull season selling our gasoline lighting systems for stores, houses, streets, etc. Write for free catalogue.

Continental- Erie Tires

**"They're
Built
to Last"**

LIFE!

THE tire that gives the longest **efficient** service is the tire for **you**. Continental-Erie tires are made in but one tread—the studded—and the attention which would otherwise be divided among different molds is concentrated on the perfection of the studded tread. Years of experience have taught us the superiority of the studded tread for hard service. The studs grip the road and only when they're entirely worn off does the actual wear on the tire begin.

Add carefully selected, high grade materials and conscientious, concentrated manufacturing methods to the undoubted advantages of the studded tread, and you have the **ideal tire** in point of **efficient service**—the Continental-Erie.

CONTINENTAL RUBBER WORKS - - Erie, Pa.

BICYCLE No. 2
Combined Lamp and Generator

When writing to advertisers, please mention **MOTORCYCLE ILLUSTRATED**.

Are You "Afraid to Come Home in the Dark?"

Do you therefore stay close at home, or else creep in slowly, in fear and trembling?

If so, you are missing most of the joy of motorcycling. A **RELIABLE** source of light, with a lamp large enough, will make night riding pleasant and **SAFE**.

A gas generator won't fill the bill, because it is not reliable, and is also a troublesome nuisance. Neither will small generator lamps meet your requirements.

Prest-O-Lite is your **ONLY** source of satisfaction—the **ONLY** practical lighting system for motorcycles.

Floods the road far ahead with brilliant light, **STEADY**, unflickering under all conditions. Turned on and off like a gas jet.

Prest-O-Lite Owners

Paul C. Stallpomp, 205 West First St., Delphos, Ohio, finds his Prest-O-Lite Motorcycle makes night riding pleasant and safe. It is the light that never fails.

Prest-O-Lite

Shows up the bumps, ruts, puddles, etc., as no other lighting system can do.

Wherever you may be exchange service may be had from one of our 20,000 dealers (motorcycle and automobile). We will arrange for prompt service for anyone, anywhere.

Expensive? Not at All!

Any experienced rider will tell you that Prest-O-Lite service costs no more—usually

costs less—than the carbide a generator consumes.

And the money you invest in the tank itself is not **SPENT**, because a genuine Prest-O-Lite Tank never gets to be second-hand, is always in demand, and is always a **READY CASH ASSET**.

No rider can afford to be without this combined **CONVENIENCE**, **PLEASURE** and **INSURANCE**. One accident due to poor light might cost you more than a year of Prest-O-Lite service.

Price \$10

(Equipped with Gauge)

Dimensions: Length, 13¼ inches; diameter, 4 inches; weight, 8¾ pounds. 40 hours of light. Easily attached to any motorcycle.

Don't Let Anyone Cheat You With an Imitation

The genuine Prest-O-Lite, when empty, can be immediately exchanged for a full one **ANYWHERE** and **ALWAYS**. Imitations cannot.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite gets the best of you. Don't let him!

We will not be responsible for short measure or poor gas in tanks not filled by us.

The Prest-O-Lite Co. 246 E. South St. INDIANAPOLIS, IND.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Mr. Dealer: It requires only a little effort for you to increase your Prest-O-Lite business. The plain **FACTS** about Prest-O-Lite, told to your customers, will make sales.

And don't get your customers into the habit of going elsewhere for Prest-O-Lite exchanges if you want to retain their trade on other things.

When writing to advertisers, please mention **MOTORCYCLE ILLUSTRATED**.

Ride The New 1913 Jefferson Twin

***Ride the Jefferson Twin if you want speed
Ride the Jefferson Twin if you want comfort
Ride the Jefferson Twin if you want power
Ride the Jefferson Twin if you want reliability***

THE Jefferson VII or Twin is years ahead of its contemporaries in all the above points. Why—because the quality is built into the machine—they are made for service—long and hard, rather than to sell.

The Jefferson VII is merely an evolution from the Jefferson IV or single, which, under the name of P. E. M. last season made such a wonderful record of success both on road and track. As good as the 1912 model was, we were able to make a few improvements which place the two 1913 models far ahead of any competitor at any price.

We can give you a few of the specifications of these two “benzine bikes” which tell the mechanical perfection of these machines, but all we could say—all we could write—all that we could picture, would be futile. We simply can’t describe the wonderful comfort of the original cradle frame, hung on 4 automobile springs—nor the intoxicating speed—it’s there—and without vibration of the motor either; nor the power, nor the reliability—except to say that every Jefferson that leaves our factory has stood the test. Words fail—you simply **must see; must ride** a Jefferson—and then you’ll know.

Let us try to tell you a little about the two Jeffersons—IV and VII.

FOR SPEED—In 1912 the Jefferson IV (then the P. E. M.) entered 47 races—and won 37 firsts and 10 seconds, and 6 of these firsts were against twins. (Write to us for our book—“A Record of our Record”—it tells all about these events.)

FOR COMFORT—The frame is hung at both front and rear hubs on Automobile leaf springs. This kind of spring has no “kick back” like the spirals. As the original cradle frame with leaf springs, being covered with patents, there is none so smooth on rider and engine and none so lacking in side swing as the Jefferson.

FOR POWER—The Waverley Engine—with its high compression chamber—overhead me-

chanical valves—large parts and Bosch Armored Magneto, gives a power above its rating—and without vibration or racking because of its very even balancing.

FOR RELIABILITY—Every engine is “block tested” then mounted in the frame—the machine assembled and then road tested till it passes our very rigid requirements for smoothness—power—control—elasticity—comfort—and then, and not until then, is it crated.

FOR PRICE—In spite of the fact that the Jefferson is so much better its price is lower than many less desirable competitors. The Jefferson IV, or single, sells for \$225.00. And take our word for it—the quality was put in before the price was put on.

The Jefferson VII, or twin, sells for \$275.00.

DETAILED SPECIFICATIONS

JEFFERSON IV

FRAME—Loop or cradle—extra large tubing—reinforced at brazings with sleeves instead of slugs. Hung on 4 Automobile leaf springs—one each side each hub. At rear allows back wheel to move vertically; absorbs all shocks and jars.

THE CUSHIONED FORK is similarly constructed. Springs are vanadium steel—very elastic and unbreakable. Fork in bridge truss giving rigidity and strength.

MOTOR—Rated Four Horse Power, Single-Cylinder— $3\frac{3}{8}$ " bore—3 $\frac{13}{32}$ " stroke. One-piece cylinder head—with large parts—mechanically operated overhead valves, giving quick firing and high power.

CARBURETER—Heitger Automatic—glass bowl.

LUBRICATION—New positive, mechanical, to crank case.

IGNITION—Bosch Armored Magneto, Gear Driven.

These give a few of the major advantages of the Jefferson. Write for booklet telling more about them—you will be interested.

DEALERS—We have a liberal proposition to dealers in unassigned territory. Any man who wants to handle a winning line should secure the “Jeffersons.”

JEFFERSON VII

FRAME—Same as IV, except tubing of loop is slightly larger.

FORK—Same as in IV.

MOTOR—Rated Seven Horse Power, Two-Cylinder— $3\frac{3}{8}$ " bore. One-piece cylinder head—large parts—mechanically operated overhead valves, giving quick firing and high power.

CARBURETER—Same as IV.

LUBRICATION—Same as IV.

IGNITION—Same as IV.

***Four Models—Four Prices—One Quality
of Material and Workmanship***

The Pope Line for 1913 is thoroughly up-to-date and thoroughly cosmopolitan. There is a model for every present or prospective type of rider and for every individual taste or personal preference. The prices are right—the machines of the very highest quality—and the range is wide.

Analyze the demand as you know it, and see how completely the various models in the Pope Line listed above, meet it. Four Distinct Models, Four Prices, ONE QUALITY.

OVERHEAD VALVES—make for High Compression, Quick Ignition, Positive Exhaust, and Direct Downward Thrust of the piston. This is the same principle applied so successfully in the design and operation of Pope-Hartford automobile engines, which are probably unequalled by any other motors of their size for power and efficiency. Similarly the Pope type of valve-in-the-head motorcycle engine develops the maximum of power for its dimensions.

TIRE PROTECTION WITH A GUARANTEE

No longer is it necessary for motorcyclists to worry about PUNCTURES, BLOW-OUTS, GLASS CUTS, SKIDDING and unnecessary tire expense, which heretofore has MARRED the pleasure of all motoring—"BRICTSON" DETACHABLE TREADS will eliminate all this.

10,000 Mile Guarantee

SEND FOR COPY OF SAME

Yes, we will give you a 10,000 mile written guarantee with every "BRICTSON" MOTORCYCLE TREAD on a daily mileage basis of twenty-five miles per

day. Can you get this kind of a guarantee on your rubber tires? Figure this guarantee out and you will see that it covers a period of 400 days.

Design and Construction

Made of select, specially prepared chrome tanned leather, soft and pliable, which gives with the "BRICTSON" the full benefit of the pneumatic tire. Studded on the surface with small neat-looking steel studs, designed to give perfect traction as well as a perfect "non-skid." There are layers of the best tire fabric between the layers of leather, which add strength and keep the tread from stretching. In addition to all these important features, the "BRICTSON" is lined perfectly smooth on the inside so there are no rivets or studs in contact with the rubber casing, making it impossible for the tread to injure the casing in any way.

The "BRICTSON" is the only scientifically constructed tread in that it CANNOT slip or slide on the rubber casing in ANY direction, owing to the patented, scientific method of fastening. It is held in position on the rubber casing by equal tension from all points of the circle, and for this reason may be adjusted to PERFECTLY fit the casing over which it is applied, which CANNOT be accomplished with any other method of fastening, and also envelops the entire casing, excluding sand, stones, mud, or even water from coming in contact with the rubber casing.

The "BRICTSON" is the ONLY TREAD THAT HAS PERFECT TENSION ADJUSTMENT FROM ALL POINTS OF THE CIRCLE, which other tread manufacturers have tried to imitate with metal contrivances that only detract from the appearance of the tread, add weight, and destroy the pneumatic feature, but still do not accomplish the desired result.

The "Bricton" Exclusive Patented Way of Fastening

The "BRICTSON" has no HOOPS, HOOKS, BUCKLES, SPRINGS, or any other unnecessary metal contrivances to add weight, break or eat into the rubber casing; neither is it cemented, laced, vulcanized, riveted or fastened to the rubber casing in any way—NATURAL INFLATION OF THE TIRE DOES THE TRICK—Simply clamped between the head of casing and rim—strictly Quick Detachable.

PRICES: One-half the price of a rubber casing and guaranteed three times as long. Compare the following prices:

26 x 2 1/4	\$6.05	28 x 2 1/2	\$7.43	29 x 2 3/4	\$8.15
26 x 2 1/2	6.60	28 x 2 3/4	7.70	29 x 3	8.25
28 x 2 1/4	7.15	28 x 3	7.98		

Other sizes on application.

Ask Your Dealer for "Bricton" Detachable Treads

Ask the best dealer in your town to show you the famous "BRICTSON" Guaranteed Detachable Tread. If for any reason he cannot supply you, fill out the attached ORDER BLANK, pin your check to same, mail it, and I will ship you the treads on TEN DAYS' FREE TRIAL, and if you don't find them perfectly satisfactory within 10 days from receipt of treads, return them and I will cheerfully refund your money. R-S**R-S****R-S Twin—Chain Drive - - \$275**

There Is No Other Free Engine Clutch as Good as the One on the R-S

We say this advisedly—and on this point all dealers and manufacturers agree. There is **one** very good reason for this: the “R.-S.” Cone Clutch is fully patented.

We have not been so fortunate—or farsighted enough—with other hitherto exclusive “R.-S.” details of construction.

When mechanical valves were introduced into this country, the “R.-S.” was the first to adopt them. Now every 1913 motorcycle is so equipped. Footrests were practically unknown in this country until their fitment on the “R.-S.” Now two or three manufacturers are proudly boasting of these desirable adjuncts to their machines.

But—

the “R-S” Cork Insert Cone Clutch—double-oiling system, double brakes, the “R.S” shock-absorbing spring seat posts, adjustable to weight of rider, and last but by no means least, the inimitable

“R-S” long stroke motor with integral cams and gears, imported ball bearings, and perfect cooling system, still gives the “R-S” the undeniable right to the title of

1913 HENDERSON

8 H. P., \$325

HENDERSON MOTORCYCLE COMPANY, 1158 Cass Avenue, DETROIT, MICH.

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

Read this and you'll know will roll on and

The 1913 Henderson, 8 H. P., 4 cylinders, \$325
free engine, chain drive

Two months ago we had just completed our first experimental machines for 1913.

No one outside the factory knew a thing about our plans for the coming year.

Yet we had on our books at that time, orders for more than half the 1913 output, and deposits to cover.

That is how the motorcycle trade regards the Henderson, after one year of the greatest success this industry has recorded.

And back of the trade, justifying a confidence that impels the payment of cash for something not yet produced, stands the motorcycle-buying public, eager for the Henderson.

This machine is a year old.

And it begins its second year with prospects that are bright for the live dealer and the discerning buyer.

The year that has just closed for us stands as the most remarkable first year any motorcycle manufacturer has had.

Because we built and sold more machines than any other motorcycle manufacturer has done in his first year.

The reason for the Henderson popularity is that it confers advantages of flexibility, smooth, silent, vibrationless running and comfort that are utterly impossible with the motorcycle of any but the four-cylinder type.

HENDERSON MOTORCYCLE COMPANY, 1158 Cass Avenue, DETROIT, MICH.

why Henderson popularity on during 1913

Left side of motor

Right side of motor

SPECIFICATIONS

Motor—Four cylinder, $2\frac{5}{8}$ " bore, 3" stroke, 65 cubic inch displacement, L head.

Starting Crank—Folding design, Henderson patent.

Carbureter—Schebler.

Valves—Mechanically operated.

Ignition—Bosch magneto, D U 4. 60-degree range, fat, hot spark.

Muffler—Sealed joints; silent, no back pressure; nicked and polished.

Lubrication—Splash system with sight feed.

Control—Double grip.

Handle bars—U-shaped, with brace.

Transmission—Chain drive, free engine.

Clutch—Eclipse.

Tank—Square type, divided for 3 gallons gasoline, 2 quarts oil.

Frame—Cradle type, $1\frac{1}{4}$ ", 13 gauge tubing.

Fork—Triple stem, with 2 large springs.

Wheelbase—65", easy riding.

Wheels—28", standard.

Tires—28 x 3", front and rear—large and easy riding.

Brake—External band, Henderson design. Extremely powerful and simple.

Foot-board—Aluminum, roomy, with rubber foot-pads.

Tool bag—Round metal—with complete set of tools.

Finish—Enameled royal blue and aluminum, with striping; highly nicked motor.

Stand—Henderson special, one piece.

Saddle—Special Henderson-Persons.

Price—\$325, F. O. B. Detroit.

Tandem—\$25, complete.

HENDERSON MOTORCYCLE COMPANY, 1158 Cass Avenue, DETROIT, MICH.

See how the tandem seat is exactly over the axle

Tandem attachment complete, with grips, \$25
foot rests, skirt guard, etc.

The center of the tandem saddle of the Henderson is directly above the rear wheel axle.

You know what that means—and you know how eagerly the riders will take to it.

This construction means the elimination of back-lash, because there is no overhang; the machine is always in balance; it rides easier for two, both for the driver and the passenger.

You can see, too, that the Henderson tandem is neither a makeshift nor an after-thought; but simply a removable part of the machine.

The main saddle is slightly lower, owing to an improvement in the shape of the frame.

Yet these are incidental in the Henderson's list of superiorities—most of them proved by a year's successful use:

The four-cylinder engine, increased to 8 H. P.; the triple stem fork of amazing strength and riding ease; the simple, easily adjusted, powerful band brake; the tires, big and easy riding, 28 x 3 inches.

So this is the 1913 Henderson—the motorcycle that will make the Henderson popularity roll onward and onward.

If you want a live proposition, write or wire; your territory may not be closed.

HENDERSON MOTOR CYCLE COMPANY, 1158 Cass Avenue, DETROIT, MICH.

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

*That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover **rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing.** The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.*

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

EFFICIENCY

EFFICIENCY means the ability to "make good." Efficient transmission is, therefore, transmission which makes good—which comes as nearly as possible to perfection in service.

It is not the efficiency of a transmission when new that counts, but the general efficiency of the transmission during its useful life. The longer the useful life, the longer will the efficiency be retained. When first applied to a motorcycle, the transmission may be **high** in efficiency, but if wear is rapid, misalignment frequent and its effect destructive to the various parts of the transmission, the transmission itself is inferior to one which has a **lower** initial transmissive efficiency, but which retains this efficiency during its entire life. Furthermore, if such a transmission besides giving more continuous efficient service, retains its life for a longer period, or is more lasting, it is assuredly to be preferred to one whose **initial** efficiency **only** is higher. A "V" belt drive's efficiency when new is 95% of the power given off by the motor and its percentage of reduced efficiency during, say, a life of 3,000 to 4,000 miles will not exceed 7% to 8%. The initial efficiency of a flat belt is slightly lower and the reduction depends on the treatment given the belt by the rider.

The **initial** efficiency of single chain drives is 97%. This high figure, however, is quickly reduced by the wear of the chains and sprockets due to misalignment and other causes. Chains in poor condition will sometimes deliver only 80% of the power, and very few chains in any case will be efficient for more than 2,500 miles. Then, too, of great importance is the general efficiency of the motorcycle as affected by the transmission. It is obvious that the transmission which longest keeps the machine in good condition, and that produces the greatest degree of satisfactory service with the least general and specific upkeep, is the most efficient form of transmission.

Belt Transmission causes less trouble and expense than other forms in that it is not seriously affected by a misalignment, which causes other transmissions to wear appreciably and frequently results in costly replacements.

Belt Transmission insures minimum wear of the power plant and frame, as its

flexibility absorbs all road shocks, which, by a more positive form of transmission, are communicated to the entire machine.

Belt Transmission causes less wear to bearings and gears than any other drive, because of its slippage under abnormal loads, such as quick starting, etc., in contrast to a more positive method of transmission.

Belt Transmission assures a high degree of comfort, on account of its smooth action when starting, and its elimination of overload shocks when accelerating or diminishing speed.

Belt Transmission is more cleanly than other transmissions, requiring less frequent lubrication, and the use of a lubricant more easily and neatly applied.

Belt Transmission is the least complicated, hence the least liable to get out of order.

Belt Transmission is more silent than other transmissions, as no metal touches the pulleys—in revolution leather touches metal, not metal to metal. Furthermore, the belt in its makeup has no small metal parts to loosen, rattle and clank.

More Economical and less troublesome; **Less Wear** on motor bearings and gears; **Greater Comfort**; **More Cleanly**; **Less Complicated** and less liable to get out of order; **More Silent**. All are points of superiority possessed by the belt drive over other transmissions, and their total produces that most desirable and comprehensive quality, **Efficiency**.

SPARTAN BELTS

resemble other belts in appearance, but in actual transmission efficiency they are as different in point of superiority as pure gold is different from gold-plate. You can be sure of obtaining the genuine SPARTAN by making certain that that name is stamped on the belt. "Spartan belts" is only another name for transmission efficiency. 90% of all belt drive motorcycles use Spartan equipment.

Yale Superiority, Backed by Big Yale Adve

YALE agents for 1913 have, from the start, a big advantage over their competitors, for Yale motorcycles give the buyer more real service—more value for every dollar he spends, more ability to answer every requirement—than any other machine that can be found. Men of experience and judgment, who make a careful study of all developments in motorcycle design, know that this is true, and the new people, who have previously paid no attention to the motorcycle, but are being aroused to its value by the remarkable national campaign of the Yale, quickly realize it, for superiority is so pronounced and positive that comparison with other machines, or a simple explanation by the agent, without need of confusing technical phrases, clinches the argument decisively in favor of the "Big Y."

Twin Problems

Take the Yale twin motor for instance: A motorcycle moves horizontally through the air; therefore, since the air currents are intended to carry the heat away from the cylinder walls, the logical thing is to have the cylinder flanges horizontal, in line with

Showing how air currents pass straight through between horizontal flanges of Yale two-cylinder motor, carrying away heat from both cylinders and giving perfect cooling.

the direction of these currents. With the flanges placed thus on the Yale twin, the air sweeps freely across both cylinders, cooling them perfectly even under long, continued hard pulls when most other machines overheat and stall.

All other twins still have the flanges at right angles to the center-line of the cylinder, the same as on a single. The front cylinder cools well enough, but the air currents, deflected by the slanting surfaces of the front-cylinder flanges, shoot over the rear cylinder, leaving it in a dead air pocket

ising, Means Supremacy for Yale Agents

Showing how air currents are deflected by front cylinder flanges on other twin motors, forming a dead pocket behind, so that heat is not carried away from rear cylinder, causing it to overheat.

that lets the heat hang close and radiate very slowly. As a result, the rear cylinder of every motor, but the Yale, is always more or less overheated, eating up power and forming a constant drag on the engine.

Success Certain for Yale Agent

With such features to point out, the Yale dealer cannot fail to convince a hesitating buyer that the "Big Y" is the best invest-

ment. The facts are too plain to be missed, and a moment's comparison, even by a beginner, shows the superiority of the Yale.

And we are guaranteeing that more buyers will come to the dealer than ever before!

Our big \$125,000 national campaign eclipses in magnitude everything that has ever been attempted for the dealer's benefit. While others are holding out **promises** of "helps" for their agents, we are **acting** for ours. Results—substantial, solid results in good hard dollars—are already being reaped by hundreds of Yale agents from the start that has been made in our campaign. These results will increase steadily, for our campaign will continue without interruption, as we are going to keep right on helping make sales for Yale agents even after our entire output is contracted for.

Our entire 1913 output will soon be contracted for. After that, no more agencies will be given! We are accepting only the livest wire in each territory. Are you the man? Speak quick, for only a little time is left.

Consolidated Mfg. Co., 1730 Fernwood Ave.

OFFICIAL F. A. M. UNIFORMS ADOPTED

Three Grades of Material, All of Dark Olive Color, Approved By Committee—Norfolk Jacket Bearing F. A. M. Emblem in Blue and Gold Will Be Standard.

AFTER careful study of the requirements of motorcyclists, in both summer and winter riding, and consideration of various grades of material submitted by leading manufacturers of motorcycle clothing, the F. A. M. Uniform Committee has arrived at a decision and a full report has just been forwarded to President Patterson by Chairman J. Leo Sauer. Three materials have been adopted, two for summer wear and one for use in cold weather riding, but the color and style remain the same throughout, the shade being a dark olive. The specifications call for a Norfolk jacket and full-size trousers with special reinforcing. On either side of the coat collar will be the F. A. M. emblem worked in yellow silk on a blue ground.

The way has now been cleared for manufacturers to submit sample suits, and when these have been passed upon satisfactorily a certificate will be issued by the Uniform Committee authorizing the maker to advertise his suits as official F. A. M. garments. The report of the committee is in full as follows:

"In compliance with the provisions of a resolution adopted at the Columbus National Assembly of the F. A. M. and the subsequent appointment of Mr. A. B. Coffman and myself as a special committee of two to determine upon an official F. A. M. uniform, I beg to submit our official report as follows:

"It has been decided to adopt three different materials, two for summer use and one for winter wear, these materials to go into uniforms all of which shall be of the same shade, namely, a dark olive, and all of the same style. The summer uniforms will be manufactured of either a genuine Roseberry or a material known as Shelter Tent. The winter suits are to be made of Fustian, a material similar to corduroy and selected for the fact that it is not only neat in appearance, durable and warm, but also can be had at a moderate price. A choice is offered as between two summer materials for the reason that the genuine Roseberry may be more expensive than some of the members may care to buy. Those who desire a more moderate priced garment will find the Shelter Tent uniform both neat in appearance and of good wearing quality. It is also waterproof.

"Before offering F. A. M. uniforms for sale, manufacturers of the same will be required to submit a sample garment of the suit or suits they intend to manufacture as F. A. M. uniforms to the chairman of the F. A. M. Uniform Committee, Room 721, 51 Chambers street, New

York. Such sample garments must be complete in every detail, as to the official specifications. Upon their being approved by the chairman of the Uniform Committee, a certificate will be issued to each manufacturer making application and authorizing him to manufacture, advertise and sell such garments as the official F. A. M. uniform. Although it is not the intention of this organization to attempt in any way to regulate the price of these uniforms, at the same time manufacturers will be expected to submit their quotations to this committee when their samples are shown for approval.

"In order to be acceptable to the F. A. M. Uniform Committee, these suits, made of one of the above mentioned three materials, and no other material, and only of a dark olive shade, must also be of the following specifications:

"The coat is to be made Norfolk style, with the lower pockets accordeon pleated and must measure, for a size 38, at least 31 inches from the collar seam to the bottom of the coat; smaller and larger sizes to be in proportion. The pockets should be made with flaps and the collar fitted with a tab so that it can be buttoned tightly around the neck. The coat to have four strap pleats of liberal width and full length, two in front and two in back also a belt and wrist tabs. At least one breast pocket and one inside pocket for the coat are also required. All coats and trousers must be made full to size.

"The F. A. M. Emblem, in blue and gold, an accurate counterpart of the official emblem of the organization and measuring one inch square, is to be woven in silk and sewed on each side of the coat collar. A square of blue silk should be used as a background and the design of the emblem worked in gold.

"The trousers must be made at least riding length, extend well below the knee and may be either laced or buttoned. The reinforcement of the seat, which should be extra wide, is to reach all the way down on the inside seam. The trousers are to have two side pockets, two hip pockets and one watch pocket, with flaps on all except side pockets.

"A copy of this letter, which has the approval of Mr. Coffman, the other member of this committee, and which is to be considered the official report of your committee, is being forwarded by this mail to the trade journals, so that all manufacturers of motorcycle clothing may be advised at the same time as to the specifications decided upon by the committee."

MOTORCYCLE CLASSIC IS PRACTICALLY ASSURED

ALATE report from the Chicago M. C. with reference to its proposed national motorcycle road race for July 4, 1913, is to the effect that returns from the manufacturers have on the whole been highly encouraging, and the American classic is practically assured. Favorable replies have been received to letters addressed to the Miami Cycle & Mfg. Co., the Hendee Mfg. Co., the Minneapolis Motorcycle Co., the Henderson Motorcycle Co., the Waverley Mfg. Co. and the Flanders Mfg. Co. The Emblem Mfg. Co. interpreted the letter to mean that the big event would not be confined to stock machines, and

stated that it would not participate unless this was the case. The Chicago club has informed the Emblem company that only stock machines will be eligible, and in all probability the Angola firm is now on the list of those favorable to the project. The Aurora Automatic Machinery Company and Harley-Davidson Motor Company had not made known their decisions definitely at latest reports.

The V-Ray Company, manufacturer of spark plugs at Marshalltown, Iowa, is the first firm to offer a trophy, a handsome silver cup and a cash prize of \$200 being pledged.

DAYTON TWINS MAKE IMPRESSIVE DEBUT

Two Models, Rated at Seven and Nine Horsepower, Are Manufactured by Davis Sewing Machine Company, of Dayton, Ohio—Reserve Compartment in Gasoline Tank, Large Tires, Unusually Strong Frame and Improved Grip Control Among the Features.

A HIGHLY attractive new-comer in the motorcycle field is the Dayton twin, manufactured by the Davis Sewing Machine Company, of Dayton, Ohio, and offered for 1913 in two powers, 7 and 9 h. This machine combines pleasing lines with a sturdy motor, and at \$265 for the lower-

of fuel for emergency use. The oil tank has a capacity of two quarts. The front fork is of sturdy construction and embodies a vanadium steel spring of the suspension type. Shock-absorbing in the rear is cared for by the Dayton shock-absorbing spring seat-post, which is credited

guards of extra width and depth are used, so that the rider and machine receive all the protection possible without cumbersome attachments.

The Dayton frame is of extra heavy gauge tubing, reinforced with D tubing, and the wheelbase is 57 inches. The Troxel No. 1 saddle is regular equipment, with the Persons optional. Braking is by the Lester center-braking coaster, which has given a good account of itself in extended tests; the muffler, while compact, is credited with practically eliminating noise. Dayton carmine is the standard finish.

Distributing Depots.

With a view of giving its dealers satisfactory service at once the Davis company has taken pains to locate distributing agencies with reputable firms in such a way that the country is satisfactorily covered. The Beckley-Ralston Company, 157 North Michigan avenue, Chicago, will handle the Dayton machines for the Central West; J. W. Grady & Company have the distributing agency for the Daytons in New York State and New England; in Pennsylvania, New Jersey, Delaware and the District of Columbia sales will be cared for by the Haverford Cycle Company, 827 Arch street, Philadelphia, Pa.; W. H. Grover, Norfolk, Va., will act as distributor in Virginia, Maryland and North and South Carolina, and on the Pacific Coast the Dayton interests will be advanced by a factory branch, located at 628 Third street, San Francisco. It is stated that the sales outlook already is excellent.

powered model and \$275 for the 9 h. type, it promises to be a lively bidder for the new season's business.

The 7 h. motor has a bore of 3.25 and stroke of 3.67 inches, while the 9 h. model has a bore of 3.50 and stroke of 3.67. This gives the former a cubic displacement of 60.92, and the displacement of the latter is 70.62. The motor has a one-piece crankcase and cover, fitted by ground joints. This construction affords maximum rigidity and prevents oil leakage. Large annular ball bearings are used with improved retainers in steel pockets, and the connecting-rod roller bearings and connecting-rods themselves are provided with take-up nuts for adjustments.

The Lubrication System.

A double oiling system is used, comprising feed drip and force feed pump, internally contained in the tank. Transmission is by chain on both models, with free engine and clutch, with side lever control, to permit of variable speeds. The gear ratio is figured at $3\frac{1}{4}$ to 1, this representing a speed of 56 m. p. h., with the motor running at 2,500 r. p. m. It is announced that other ratios will be provided on specification. The double grip control system is used, embodying improvements which give greater positiveness and durability. The grips themselves, are so constructed as to give long service no matter how roughly handled.

The ordinary capacity of the gasoline tank is $2\frac{1}{2}$ gallons, and there is a reserve compartment capable of holding one pint

with unusual strength while affording satisfactory resiliency.

Large Tire Equipment.

It is worthy of note that 28 by 3-inch tires will be standard equipment on the Dayton machines. United States tires will be fitted regularly, with Diamond or Goodrich tires as options. The rims are of the 28-inch C. C. type and extra heavy, being capable of taking either $2\frac{3}{4}$ or 3-inch tires to advantage. The front wheel is fitted with 36 spokes and the rear has 40. Mud-

AT a recent meeting of the motorcyclists of Burlington, Ia., the Hawkeye Motorcycle Club was formed and the following officers were elected: Francis M. Field, president; Harry Mauthe, vice-president; C. R. Hutchinson, secretary, and Joe Miller, treasurer. August Gerdes was chosen road captain, with George Gantz and Arthur Lindquist for his lieutenants.

NEW HERZ MODEL

CHARACTERIZED by even greater reliability, regularity of efficient current output and extreme range of sparking speeds, the 4U1 model of the Herz or Ruthardt magneto, made by Herz & Co., 295 Lafayette street, New York, exhibits a number of changes over previous models for motorcycle ignition. Chief among these are the use of U-shaped magnets instead of those of the laminated horseshoe type, the use of pole-pieces in an improved armature tunnel and a new means of securing the condenser plates. A new terminal, wholly encased in hard rubber and thoroughly waterproof is fitted also.

New Magnet Form.

The outward appearance of the new model is but slightly different from the corresponding machine brought out in 1912. The overall height is, however, nearly one-half an inch greater and the arch slightly different in shape. Like all Ruthardt magnetos, the 4U1 model is armored by aluminum end-plates, and with the new insulated terminals is thoroughly water and dirt-proof. The magnets are double, there being two sets which are connected horizontally by a brass tie-rod, which serves as a brace and as a handle when the magnets are being magnetized. The body is rectangular, with the pole-pieces inserted at the sides, and the top and base plates are brass castings, screwed in place. The tunnel

thus formed enables any removal of the armature to be readily made by taking off the end bearing plates, so that repairs can be quickly effected should these be necessary. Ball-bearings are used to carry the armature as in previous models.

Condenser Construction.

The condenser is carried on the armature between the armature ends, electrical connection being made by a flat spring end on one of two clips, which keep the mica plates together, and through a hollow spindle which bears the whole con-

denser section. These clips are further reinforced by double wrappings of braided cord, dipped in waterproof composition. A similarly treated flap protects the end of the condenser which is exposed within the armature frame. Frilling of the condenser plates due to excessive vibration is thus eliminated thoroughly. The contact-maker casing has been made stronger and the timing-lever is of flat section, in place of the rounded one hitherto fitted. The terminals have contact sections of the glove-fastener type, the "button" being split in two planes at right angles to each other, while the "doll's head" has deep hard-rubber combined seating and knurled sections whose extension forms the shell of the carbon contact brush. Surrounding the "button" end is another hard-rubber shell, and when assembled play is impossible and the joint is proof against water or dirt. The connection can only be broken by a direct vertical pull, and this eliminates the nuisance of terminals coming off.

The magneto permits of very easy starting on retarded spark, and its weight is scarcely

three-quarters of a pound greater than that of the single-cylinder Herz model which it succeeds. Other constructional details remain unchanged since 1912.

Assembling and Testing.

The assembling of a Herz magneto is a simple operation and well worth a visit to the factory to see. The body and end plates are in one unit, the magnets in another and the complete armature and bearing plates also. The magnets are magnetized by means of a

special electro-magnetic apparatus, and when thus charged have a bottle-section keeper placed over the ends. In the swelled portion of the keeper is put the body, which is then drawn up so that the magnets fit in place, when the keeper is withdrawn. The armature and bearing plates are fitted, and the machine taken to a running-in stand, where it is given a 48-hour run under expert observation. When satisfactory it is placed on a special testing apparatus which incorporates a spark-plug in a chamber under any desired compression. On this apparatus it is run to determine the maximum efficient speed and also the minimum speed, which is indicated on a tachometer. The minimum speeds vary from 66 to 75 revolutions per minute, while as high as 3,800 revolutions are frequently obtained, the plug being under regular motor compression pressure.

PULS WAS CLUB VISITOR.

GEORGE PULS, of the Harley-Davidson staff, was the guest of the Ft. Wayne (Ind.) M. C. at a recent meeting. After fifteen new applications for membership had been recorded Puls addressed the club and advanced the opinion that it is one of the liveliest in the F. A. M.

The 1913 Herz Magneto.

FIVE NEW MAJESTIC MODELS FOR 1913

Worcester Company Will Continue to Produce 1912 Type of Sidecar, and Will Add Four Attractive Passenger Attachments of Latest Designs and a Sturdy Parcel Delivery Car—A "Canoe" Body Along Popular English Lines is on the List

DURING the season of 1912 the Majestic Manufacturing Co., of Worcester, Mass., produced only one model of sidecar, but the wide favor with which it was received, and the rapid advance of sidecars in popularity have made it evident that a broader choice in designs will be desirable for next season. Keeping in touch with riders throughout the country, the Majestic company has collected a mass of valuable information in regard to sidecars, and this has been embodied in the models offered for 1913.

For the coming year the Majestic company will not only continue to produce the model of 1912, but will introduce four new passenger sidecar models, as well as a parcel delivery car. The latter has been already announced, and is now familiar to the public.

New Models in Two Grades.

The new models will be produced in two grades. The first of these will be the De Luxe cars, of which there will be two models, both having high front and sides, with side doors, and high luxurious back, making a very handsome and up-to-date vehicle. One of these models will have a wide curved front, while the other has the graceful canoe front, which has found so much favor abroad. The chassis of the De Luxe car has a double frame, easily adjustable to any motorcycle on the market, and of unusually substantial construction. These two models are heavily upholstered in dark colors, and the outfit includes a waterproof storm apron and a thick floor mat. These two models list at \$90.

A Child's Seat Attachment.

The lower priced models, listing at \$65, which are first-class, substantial cars and built of the best material, will consist, first, of the 1912 "Standard" model, which is already so well known. The fourth model will be the "Standard Canoe," which, as its name indicates, has the popular canoe front,

but with low sides, and without side doors. These two models are mounted on a chassis of the same design as that for 1912, but built of seamless steel tubing of much heavier gage than has been used heretofore, and strengthened in many particulars. The fifth model is similar to the 1912 Standard, but with a longer body, in the forward end of which is fitted a detachable child's seat.

De Luxe Model with Canoe Front.

This model was frequently asked for during the past year and will fill a wide demand; it lists at \$75.

Other Majestic Improvements.

All the above models will be mounted on especially long and flexible "C" springs of vanadium steel, which have been fairly tested in comparison with the best foreign made springs, and show that they are much superior in flexibility and durability. New hubs will be used on all Majestic models, in which the ball cups will form an integral part of the hub. Another feature of interest is that the attachments of the new Majestic line will all be made of steel forg-

ings, in place of the usual malleable iron fittings. This insures unusual strength.

The designers of the Majestic car have given particular attention to the various new methods of construction which have been produced abroad of late, but practical experience with American road conditions has shown it to be undesirable to adopt complications of springwheels, castor wheels, or other devices of the kind, as these all introduce additional small parts which necessarily result in weakness, and are undesirable for the hard service required of sidecars in this country.

Rapidly Growing Demand.

The new parcel car is meeting with remarkable favor, and already there has grown up a large demand for this model among merchants who have quantities of small articles requiring prompt delivery.

Riders of motorcycles are fast learning that the use of the sidecar is by no means confined to city boulevards and state roads, but that they can be used on any kind of a road where a motorcycle can be driven, and frequently on sandy and rutty roads where it would be difficult to use a motorcycle without the steadying assistance of the sidecar. The season of 1913 promises to be a notable one for sidecars, and the sidecar will undoubtedly, in turn, attract favorable attention to the motorcycle.

TWO BUSY AGENTS.

THE Heinz Motor Company, which recently succeeded the Chase Motor Company in handling the Harley-Davidson interests in Baltimore, Md., is in charge of two thoroughly capable men, both of whom have broad knowledge of the motorcycle field. Bert Heinz is the general manager and salesman, while his brother Gus handles the mechanical end of the business. The latter was for some time associated with Howard French, Indian agent in Baltimore.

The Majestic Trinity Model; Note Detachable Child's Seat.

Curved Front De Luxe Type, Another New Model.

CLUB IS GOING HIGHER

National Capital Motorcyclists Seek Supreme Court Aid in Their Action for Tandem Permit.

WASHINGTON, D. C.—After several conferences between a special committee representing the National Capital M. C. and the police officials of this city relative to the rescinding of an order issued some time ago which placed a ban on the carrying of a passenger on a motorcycle, the committee has refused a concession offered by the police and instructed its attorneys to continue proceedings. The police department, after examining a standard tandem attachment, issued a permit,

good for six months only, allowing the use of the tandem attachment, but only with a male passenger. The club had asked permission to carry either a male or female passenger on any safe form of attachment the owner of the machine might prefer.

When the police decision was made known the club expressed its dissatisfaction and instructed its attorneys, Higgins, McNeill and Evans, to apply to the Supreme Court of the District of Columbia for a writ of mandamus, requiring the Commissioners of the District to show cause why a permit for tandem riding should not be issued. The club has received an offer of assistance from the F. A. M. Legal Action Committee, through its chairman, J. Leo Sauer.

RACE FOR NOVEL WAGER.

IT is quite probable that the Elwood M. C., of Elwood, Ind., will have its light bill for the winter months paid by one of its members. M. Humphry and W. Runyan, two star riders of the club, recently made a wager, the terms of which required the loser in a race to Logansport and back to pay for the light used during the winter months at the club rooms. Runyan finished the trip in two hours and 50 minutes, while Humphry's time was two hours and 55 minutes. As Humphry claims he was delayed on the road by a policeman, Runyan has agreed to ride another race, which will decide who has to foot the bill. The next contest will be to Indianapolis and return, a distance of 90 miles.

NEW CLUBS.

LATE club affiliations reported by Secretary Gibson are as follows: The Manhattan M. C., of Manhattan, Kan., and the Brazil M. C., of Brazil, Ind. The re-affiliation of the West Side M. C., which was formerly located at Maricopa, Cal., and which now has its headquarters at Taft, Cal., is also reported.

CONTINUING SUNDAY RUNS.

ALTHOUGH most motorcycle clubs are now turning their attention to pool tournaments and other indoor pastimes, the members of the Salt Lake City M. C. are still holding to their Sunday runs. The run of December 1 to Pleasant Green was featured by a large number of sidecar passengers, most of whom were ladies. On December 8 the boys rode to Lake Point.

F. A. M. COMMISSIONERS.

THEODORE SIDDALL, of Manila, has been appointed commissioner for the Philippine Islands. Other new State commissioner appointments made by President Patterson are those of S. M. Saunders, of 727 Common street, New Orleans, for Louisiana, and C. J. Ritchie, 608 "L" street, Hoquiam, for Washington.

CHARLES H. WESTCOTT, of 38 Keene street, Providence, has been appointed as State secretary for Rhode Island.

A RECENT affiliation is that of the Queen City M. C., of Springfield, Mo., of which T. McCarthy is secretary.

THE Montana F. A. M. State Commissioner has appointed W. H. Eilers as local commissioner for Helena.

TORONTO DUES INCREASED.

TORONTO, Ont.—At a recent meeting of the Toronto M. C. a motion was carried by which the club fees were raised from two to four dollars per annum. This was not done without some lively discussion, as the members felt that they were not getting full value from their membership. It was pointed out that there were numerous advantages to be gained, such as affiliation with the Canadian Motorcyclists' Association, with its ever growing benefits, social privileges and a general feeling of comradeship possible only through association with a live motorcycle club. A report was handed in by one of the executives showing how it would be possible for the club to have well furnished clubrooms, such an arrangement being possible only with the increased fee. When this was brought forward the boys felt that the change would be for the general benefit of the club and the motion was carried.

HANDLING RETAIL SALES.

ANNOUNCEMENT is made that the Reading Standard Sales Company, of Chicago, has taken over the retail sales department of the Angsten-Koch Company, and that as a result the quarters of the former firm will be considerably enlarged. In addition to handling the sales for Cook County the company will cover 16 other counties in Illinois and Indiana, the territory in all being more than 8,500 square miles. The Reading Standard Sales Company disposed of six twin machines during the first ten days after closing its deal with the Angsten-Koch Company, thereby indicating that it is awake to its opportunities.

HILL-CLIMBING PROGRAM

Toronto M. C. Stages Highly Successful Events in Four Classes Including Trials for Sidecars.

TORONTO, Ont.—Four classes were arranged for contestants in the annual hill-climbing program of the Toronto M. C., held November 23. The events were staged on Bathurst street hill, about a mile and a half from the heart of the city. The hill, one of many quite precipitous ones in the vicinity, is admirably suited for motorcycle contests. The surface is none too smooth and owners of high-powered machines found plenty of opportunities for skillful jockeying on the way up. The course was 960 feet long and the average grade was 1 in 6. The riders started from a standstill. This gave them about 50 yards to travel before striking the hill proper.

A CALIFORNIA TRIP

Lindsay Motorcyclist Covered 301 Miles in Less Than Eleven Hours on the Road with Mercury at 100 in the Shade.

W. C. YEAGLEY, of Lindsay, Cal., recently made an interesting tour by motorcycle from Marysville through Sacramento, Stockton, Modesto, Merced, Madera, Fresno and smaller places, his cyclometer showing that he had traveled no less than 301 miles when he decided to put up the first night at Selma. Yeagley had spent exactly 10¾ hours in the saddle. From Sacramento to Stockton the tourist rode over an ideal road, but from Modesto southward he encountered exceptionally hard going. In some places the road had been almost obliterated through the operations of the gangs at work on the State Highway, which is now being constructed. Yeagley's detours to avoid the stretches which were torn up added considerably to his mileage.

To make matters worse, the temperature ranged from 100 to 110 in the shade for about six hours, and it may be taken for granted that the heat was much more oppressive on the open road. Yeagley experienced considerable trouble with sand toward the end of his tour, but managed to pull through on schedule time.

TORONTOANS ON THE ROAD.

TORONTO, Ont.—Every Sunday morning while the fine weather holds a number of Toronto boys may be seen chugging out Dundas road toward Cooksville, about 18 miles from the city. Here a general conference is held, or perhaps there is a run down to the lake front at Port Credit. A turn to the north takes the riders to Brampton, a beautiful little town on the C. P. R., where a number of Toronto people have their homes.

PIERCE REPRESENTATIVES.

DESPITE recent set-backs owing to financial difficulties, the 1913 prospects of the Pierce Cycle Company are very bright, according to a statement from Sales Manager W. A. Johnson. Mr. Johnson has just completed an extensive trip throughout the West and is now traveling eastward. He says the number of orders received was beyond all expectations. He took orders from jobbers for goods to be carried in stock, in amounts varying from \$5,000 to \$20,000.

The machines were classed as follows: 4 h. belt drive, 4 h. chain drive, 7 h. belt or chain drive and 7 h. with sidecar. In the first event the British machines with their small wheels showed well, Newport, on a Triumph, being the winner. In the 4 h. belt drive class Shuttleworth was first on a P. E. M.

Sensational work by the twins featured the meeting. They romped up the difficult grade without perceptible loss of speed; Herb Kipp scored the fastest time. The lightweight machines also gave excellent accounts of themselves. Two Douglas mounts and one N. S. U. negotiated the hill successfully, going up on high speed and without faltering. Bert Webb with Indian 7 and sidecar won out in this class, his time being 26½ seconds. Later one of the boys took the hill with two passengers and not satisfied with this he added still another passenger and reached the top with little difficulty.

NEW JEFFERSON TWIN A STURDY MOUNT

After Exhaustive Road Tests Waverley Manufacturing Company Announces a Speedy Two-Cylinder Model Which Embodies Unique Spring Construction and Distinctive Silencer Among Other Features.

FOR the last year people living in and near Jefferson, Wis., have had their attention repeatedly called to a sturdy young man and a capable-looking motorcycle that dashed to and fro over all kinds of roads and without the slightest regard for weather conditions, and now the curiosity aroused by the rider and his mount is to be satisfied. The young man is a tester and his mount is the latest product of the Waverley Mfg. Co., the 7 h. Jefferson twin. This brief announcement may meet the requirements of folk in general in and about Jefferson, but motorcyclists will hanker for details, and accordingly the company has made a formal statement.

When the decision was arrived at to produce the new twin, steps were taken to give it the most severe tests on the road, and every part was subjected to unusually rough handling before it was deemed worthy of a permanent place in the mount. It is stated that the machine has developed no faults in all its strenuous work, and the company looks for big things from it.

Distinctive Springing.

The new machine is equipped with ingenious cradle springing in the rear, and with a radical leaf-spring device in the front fork. The springs have been tried out under most exacting conditions, and both front and rear constructions have met all the expectations of the designers. They announce that the system has been found to combine strength and resiliency to a most satisfactory degree.

The motor is the Waverley, well known through its excellent work during the past summer. This power plant, fitted in what was then known as the P. E. M. machine, pulled 37 firsts and 10 seconds out of 47 races in which it was entered, the victory being scored in each case by a single-cylinder machine. It follows, argue the designers, that when the new twin is in racing trim it is bound to be heard from satisfactorily.

High Power and Low Weight.

The Waverley motor is equipped with the popular large-port, mechanically-operated overhead valves, with high-compression chamber, so that the highest possible speed is afforded without unduly weighting the machine. In other words, there is a combination of high speed and low weight. The Jefferson makes an excellent appearance on the road and is credited with being as comfortable and sturdy as it is attractive in exterior make-up.

It will be noted that the muffler construction on the new Jefferson follows unusual lines; the silencer is concealed and while comparatively small it is said to be remarkably efficient. The Waverley company is now putting out an advance circular which will tell dealers

enough about the new machine to hold their interest, and this literature will be forwarded promptly on request. As the most interesting product of a plant that has already earned considerable road and track prestige the new Jefferson twin is certain to come in for its share of attention among 1913 models.

THE HAWTHORNE LINE.

ADVANCE proof sheets showing the lamp line of the Hawthorne Mfg. Co., of Bridgeport, Conn., for 1913, are now being distributed and dealers and riders will find much to interest them in the descriptions and illustrations of improved models. The usual attractive Old Sol line is shown and one of the features of special interest is a sidecar lamp, which combines a powerful light with minimum consumption. This lamp generates 100 candlepower. It may be attached to the sidecar with a finger iron or to the motorcycle itself with a regular bracket. Unusual interest attaches to the company's line of up-to-date tail lamps, particularly in view of the fact that all large cities are now demanding rear lights on motorcycles as well as on motor cars.

THE YALE OUTPUT.

TOLEDO, O., November 22.—Manufacturing facilities at the Yale factory are being greatly increased to take care of the record amount of business that is pouring in. Orders accompanied by cash deposits are already on hand in numbers equal to 137 per cent. of the total number of machines sold in 1912. More than twice the number of machines built in 1912 are planned for next year, but the business outlook makes it certain that all of these will be sold long in advance. At the rate orders are being received now, the entire output for 1913 will be sold by the end of New York's show week.

JOHN SYKES, JR., the Indian agent at Trenton, has 28 orders for 1913 twin Indians.

U. S. TIRE EXTENSIONS

Plans for Next Year Call for Sixteen New Factory Buildings, Ranging from 2,000 to 130,000 Square Feet.

THE greatest daily output ever considered possible in tire manufacture is provided for in next year's plans of the United States Tire Company, which have just been made public. This concern, which operates four great plants, plans an expenditure of over \$3,000,000 in factory improvements and extensions.

First of all, the Morgan & Wright plant, which is located in Detroit, is to be doubled in both area and production. Ground has been broken for several new buildings and work will be rushed forward as rapidly as possible. An idea of the extent to which this factory will be increased may be gained from the fact that whereas its employees now number 2,500, 6,000 workmen will be required when all the improvements are finished. The output of the factory will be in excess of 5,000 tires daily. It is planned to erect sixteen new factory buildings, ranging in size from 2,000 square feet to 131,000 square feet.

In addition to its big Detroit factory, the United States Tire Company operates extensive rubber works in Indianapolis, Hartford and Providence, and it is the intention to increase the facilities of all these plants. At Indianapolis a building 80 x 170 feet and six stories high is being erected. At Providence, another structure 75 x 300 feet and three stories high will be added, while at Hartford a fine new powerhouse and power plant have been installed at a cost of more than \$175,000.

DROWN WITH STEEL CONCERN.

J. W. DROWN, formerly advertising manager of the Standard Roller Bearing Company, Philadelphia, Pa., has resigned and accepted a position as sales manager of the Pressed Steel Manufacturing Company, 504 Land Title building, that city.

The R-S for 1913

Three Reading-Standard Models for Coming Season Show Motor Improvements, Ingenious Cam Construction, Re-Designed Clutch, Greater Fuel Capacity, More Efficient Braking and Increased Standardization of Parts. —Lower Prices Listed.

ALL the efforts of the Reading-Standard designers and factory staff are being concentrated upon the production of three highly attractive motorcycle types for 1913, this company having disposed of its bicycle interests in order that its plant might be devoted exclusively to motor-driven two-wheelers. Revised prices for 1913 share interest with improved motors and a number of other important changes and refinements. The new 7-8 h. twin, chain-driven, will list at \$275; the 5 h. single-cylinder Tourist model, with either chain or belt, at \$225, and the 4 h. single-cylinder service model, with belt drive, lists at \$200.

The Improved Motors.

The improved Reading-Standard motor for 1913 is a triumph of engineering and manufacturing skill. It is distinguished by unusual reserve power, rapid acceleration and plenty of speed. Simplicity, durability and economy, widely recognized as attributes of the R-S motors of 1912, are none the less marked in the new product, and in addition vibration and wear are further offset and efficiency is brought to the maximum. The most radical change in the new R-S motor is found in the single-cylinder Tourist model, which is a practically new power plant. It follows the lines of the sturdy twin motor, which has given exceptional results.

Cam Refinements.

The valve gearing is the same throughout the Reading models, and an interesting and valuable factor is the making of the intake and exhaust cams and the operating gear

wheel, of a single piece of vanadium steel. The gear wheel forms the basis of the unit, and a liberal-sized and substantial cam is milled on either side of it in the proper position. This prevents any shifting of cams

More Motor Details.

The valve lift rods, of vanadium steel, are screwed into the base and are provided with felt washers which absorb oil, prevent leakage and also act as lubricators of the lift rods.

5 h. R-S. Single. Note Chain Guard and Racy Lines.

or errors in assembling, which may occur when cams are pinned to the shafts. The cams are both undercut around the centers, providing unusually long and substantial shafts and bearings, without increasing the depth of the gearcase. Single lift levers transmit the movement from the cams to the valve lift rods thus effecting additional simplification of the mechanism.

The re-designing of the compression space in the cylinder and valve pockets, on entirely new lines, will give an unusually good clearance of burnt gases, thus obviating any tendency to overheat and assisting in obtaining a better charge of gas for the next explosion.

The crankcase compression release, formerly located on the rear of the cam case, directly under the magneto, has been changed by relieving the compression through a boss. This is cast integral with the rear half base and is provided with a specially designed ball chuck to prevent loss of oil.

The Re-Designed Clutch.

The new Reading-Standard models will be equipped with a cone type clutch, the same as that fitted on the 1912 twin, but with the addition of cork inserts. This arrangement insures a perfect grip and smoother engagement, and adds materially to the efficiency of the fitment. Two-point ball bearings have been substituted for the radial bearings previously used, these caring for end thrust in a more efficient manner and permitting of easy adjustment to take up wear. This improved clutch is of the same general construction as the automobile type which has stood the test of years of hard service. Its most prominent features are simplicity, durability and ease of control.

(Concluded on page 56.)

WHY I GAVE THANKS

BY J. MCKURKIN

Interesting Sidelights on a Tour, a Tumble and a Turkey That Enlivened Thanksgiving Day for a Motorcyclist Who Refused to Be Forgotten.—A Baffling Puncture and the Good Samaritan Who Arrived in the Nick of Time.

ONLY a day or two prior to our festival of thanksgiving that has just gone into the chronological discard, my folks—father, mother and younger brother—received one of those short-notice invitations from relatives in a town forty-five miles distant to assist in the demolition of a turkey, and almost before I knew what was happening I was slated for a lonesome holiday. It was agreed that I would not be able to shake off business shackles in time to join the others on the trip, and my father, calm philosopher that he is, decided that my wisest course would be to remain in M——, and eat my Thanksgiving dinner in a restaurant. This may have seemed like a reasonable decision under the circumstances, but it did not take into consideration my love of a sporting chance, and it left entirely out of the reckoning my trusty and battle-scarred motorcycle! Thereon hangs the tale I am about to pass along to the brethren.

Holidays in general are tolerable, but just let one begin to develop symptoms of lonesomeness and it becomes at once as forlorn a period of time as ever begrouched a calendar; with this in mind I was determined to dodge that solitary dinner, but I refrained from exciting the folks by taking them into confidence. Early in the afternoon of the day before Thanksgiving they went off to the train in high feather, and I went to the office—in low feather, if there is any such type of temperamental plumage.

Beginning to See Light.

Up to this time I had given my motorcycle only a passing thought in connection with the situation, but as I gloomed at my desk it began to dawn on me that the single-tracker might save the day. The machine, a two-speeded single, had been placed in storage (my opportunities for riding of late had been few), but I knew it was in excellent running condition, and felt that I could depend upon it in any kind of a harem-scarem adventure that might develop. By leaving home at a fairly early hour on the morning of Thanksgiving Day I should have no difficulty in arriving before noon at the scene of the prospective feast, provided I did not lose the road or have a mishap, and as I have already intimated, I was willing to take a chance. I was too wise to place any dependence in the erratic holiday train schedule out of my home town (although a map of northern New Jersey really does show our town), and being unable to leave the afternoon or evening before, my plans simmered down to the motorcycle—or nothing. It required just nine seconds by the office clock for me to decide in favor of the motorcycle.

When I rolled out of the covers shortly after 8 o'clock on the morning of the holiday snow was falling—sulkily, and a bit timidly—

but still falling. (The weather conditions will no doubt be recalled clearly enough by the boys throughout the east-central districts who had arranged a road trip for the day, so I need not dwell upon them.) For a moment my plans tottered, but I decided that the first snow of the season could not amount to much, and was soon stowing away a hearty breakfast. Half an hour later I was trundling

"I had departing visions of the turkey."

my machine out of the garage and making road inquiries.

Three Miles on Wrong Road.

A hasty examination showed my tool kit to be in fair shape, but my tire repair outfit was practically bankrupt. I hesitated, with an idea of laying in some patches and cement, but finally decided to waste no more time. After all, the trip would be only a jaunt of 45 miles; under the conditions the rider who would worry about cement would be little better than a mollicoddle. At least that's the thought I consoled myself with as I swung into the saddle. It was slow going for a time, the roads being quite soft in spots as

a result of the snowfall, and on more than one occasion I had picked out an inviting looking puddle for a flop when I managed to wriggle out of a skid and remain upright.

I had traveled about 10 miles from M——, and was purring along a fair stretch of country road when I encountered a milkman, evidently homeward bound from his morning trip into a nearby town. Being at peace with the world and quite pleased with myself I called out a greeting to him.

"Am I headed O. K. for W——e?" I queried, just by way of being sociable.

"Almost," replied the knight of the milk cans, as he pulled his horse to the side of the road. "You lost your way only 'bout three miles back, and it ain't so very hard to get on the right road again. I'll show you a side road that'll save you time; it's in good shape, too."

I spent half an hour in traveling two miles on that time-saving road, and considered myself lucky to get through with my machine intact, but it did finally bring me out on the main route.

Making Up Lost Time.

Suddenly it struck me that I was falling behind my schedule, and I started to make up some lost time. For 20 miles I romped through the snow-mottled countryside in high spirits; then came some stretches of sand and finally a hill with a ragged surface. About halfway up I felt my rear wheel bump, and with my spirits going down ten notches at a flop I slid out of the saddle and jacked my machine up on the stand. I could not find a new puncture, but there was no denying that my rear tire was shy of air. Off came the casing, and I began an anxious inspection of three old patches. One of them was in bad shape, and I finally detected the leak.

I figured that by careful doctoring I would be able to make that patch hold air, but I was mistaken. A search of my kit revealed two new patches, but both were too small to replace the old one satisfactorily. I pumped a bit, scratched my head another bit and then pumped again. I coaxed about two slim drops of cement out of a battered tube, and then squeezed the patch into position until my fingers ached. I waited patiently for the cement to "set" and then took to pumping again. As soon as the weight of the machine was let down on the rear tire the casing flattened with surprising rapidity. I do not believe I could have ridden three hundred yards on it without danger of bumping the rim. How it managed to hold out for the first 30 miles or so is still a mystery.

Departing Visions of a Turkey.

While the day was not cold, neither was it oppressively warm, but I soon managed to

work up perspiration, partly through exercise but chiefly because my visions of an old-fashioned turkey dinner were fading with every second that passed. And that wasn't all; there were strong indications that I would not be able even to enjoy a restaurant meal. I thought of all the weird tire wrinkles related by my friends at the club; of wads of chewing-gum that formed emergency patches, and even of tire repairs made with postage stamps, but I am not a gum enthusiast and I never carry stamps. I estimated that I was four miles from the nearest town—and that I was likely to stay there.

With sickening monotony something in my mental machinery continued to click off the most enticing items of a Thanksgiving menu: turkey, cranberry sauce, and mince pie—turkey, cranberry sauce and mince pie—turk—

Suddenly another sound broke in and smothered my sub-conscious reiteration of the menu, a sound that startled me at first and then brought joy to my heart; it was the put-put of a motor, a motorcycle motor! I held my breath until I was certain that the machine was headed in my direction and then turned loose a full-grown whoop. Half a minute later a rider came over the brow of the hill, and his brakes whined as he pulled up beside me on the down grade.

Strange to say, this motorcycle Samaritan was no youthful plugger of winter roads, but a sedate and whiskered chap who smiled consolingly as he heard my story. Without undue fussing he dug into his kit and brought out patches and cement, and in little or no time we had a new patch on my tube. He insisted upon taking a turn at my pump, and finally passed a cigar to me with his card. He proved to be a collector for a leading insurance company, and a lover of the outdoors who looked upon all hapless roadsters as his brothers. He was one of the strongest arguments for the motorcycle I have ever encountered; the mere knowledge that such a man could be vitally and enthusiastically interested in the motor two-wheeler would have made a convert of any open-minded person who met him. Wherever he may be he is a

powerful force for the upbuilding of the sport.

A hearty handclasp and I was on my way again. At a quarter to twelve I was still about six miles from my destination and not very sure of the road. My tire gave me no further trouble and I was kicking the miles behind me and taking chances with the route when I developed an annoying thirst—for water, brethren, simply water. At the first farmhouse I stopped. They gave me water and also offered milk. My thirst quenched, I pushed my machine out into the road and prepared for a running mount. Just as I swung into the saddle a well-meaning pup ran out of the yard, barked and capered beside my front wheel for a few feet and then upset me. It was more a skid than a genuine spill, but I went down ignominiously. There was no damage, except to my feelings, and I interceded for the pup who was about to have better manners kicked into his carcass by the apologetic owner of the house. After all, it was a holiday and I was headed for an old-fashioned turkey dinner, so I refused to hold that spill against the exuberant pup.

Just in Time for Dinner.

About twenty-five minutes later I pulled up before the home of my relatives, and of all the party that greeted me my own folks were probably most surprised. They were just about ready to begin operations on the turkey, and after putting my machine under a wagon-shed and taking a hurried wash I was prepared to do my part. It is superfluous to state that I did it nobly. I cannot recall another occasion on which my appetite appeared to be so thoroughly awake to its opportunities. After the dinner came a good cigar and my story of the trip in detail. Then I settled back and gave thanks; first, for having a motorcycle; secondly for having the nerve to take a sporting chance with it, and lastly for having met a true knight of the road who enabled me to reach that elusive turkey with colors flying. There's something to a holiday, after all, but a fellow can't get along without the proper spirit and a motorcycle will help him find it.

agreed that the outing was one of the most successful they had ever known. The accompanying photograph, forwarded by H. Conboy, was taken at the gate leading to Kawana Springs.

NO LACK OF GAMENESS

Miss "Cy" Woodman, Again Halted by a Fall, Asserts She Will Finish Trip to San Francisco.

WHILE her progress across the country has been comparatively slow, Miss "Cy" Woodman, who left New York City in August for a trip to the Pacific Coast, has at least established a reputation for gameness. When last heard from the girl writer and lecturer was laid up in Des Moines, Ia., as the result of a fall from her machine at the bottom of a long hill. The accident left her with one eye closed and with several ribs injured. This was the latest of no less than a dozen spills in which Miss Woodman had figured since leaving New York; on several occasions she has been compelled to halt for a week in order to recover from injuries. Most of her serious falls have resulted from a desire to hit up too lively a pace over bad roads.

Despite the fact that she has some of the worst going of the trip still ahead of her the girl rider asserts that she will reach San Francisco before the first of the year, and have time to spare. She is mounting a Flanders 4 which has given a good account of itself throughout the long grind.

TRENTON OFFICER ACTIVE.

A MOTORCYCLE officer in Trenton, N. J., made twelve arrests in one week, and fines were imposed amounting to \$125. From \$10 to \$25 is charged for the first offense and a fine of \$100 is the penalty for the second speeding offense in the New Jersey capital.

BIG SAVING IN TIME.

A MOTORCYCLE has been the means of enabling H. G. Ellis, a rural mail carrier of Greenfield, O., to reduce the time required on his route from seven hours to less than two hours.

MOTORCYCLES have recently been installed in the Post Office Department at Memphis, Tenn., for the use of the special delivery boys.

ATWOOD, Kan., November 30.—Edward L. Garver, riding a single-cylinder Yale, took first place in every event at the race meet here today.

AN OAKLAND OUTING

Members of Active California Club Enjoy Run to Kawana Springs Where Santa Rosa Riders Are Met.

ONE of the recent outings of the Oakland (Cal.) M. C. was to Santa Rosa. The trip was made over the Creek Route to San Francisco, where the tourists boarded a boat for Sausalito; it was from this point that the run to Santa Rosa was actually started. The roads were in excellent condition, but as the

country was new to some of the riders a slow pace was maintained. In and near Petaluma—the town known all over the state for its egg output—the motorcyclists inspected several of the chicken "ranches."

When within a mile of Kawana Springs, the turning point for the run, the Oakland squad met a number of members of the Santa Rosa M. C. who had ridden out to greet the visitors. These scouts led the way back to the Springs where a fine chicken dinner was enjoyed. The homeward run was made late in the afternoon, and the Oakland enthusiasts

A YANKEE ON EUROPEAN ROADS

MAXIMILLIAN ST. GEORGE

LEAVING Cyrille's early in the morning, I rode through Montpellier, Nîmes, Remoulins, the old walled Papal town of Avignon, and up the Rhone river. In Orange, where there are some famous Roman ruins, I changed my tires around, as the rear one was in a sad state. That day, in Valence, just as dusk was falling, my clutch suddenly slipped and refused absolutely to transmit any power to the rear wheel. At a small mechanic's shop we found on dismantling the clutch that the axle connecting the clutch with the two-speed gear box had slipped the nut. When this was replaced we thought the difficulty was remedied.

I stopped for the night at the Cafe Esteve. For 48 cents I had a very good room and bed, and a course dinner of the famous French potage; porterhouse steak, cooked in butter, eggs, fish, cake and apples and a quart of wine. One is able to secure accommodations as good as this throughout all of France, Italy and Spain, if one goes to the smaller hotels, cafes or restaurants.

Locating the Clutch Trouble.

In the morning the engine turned over but a few times before the same nut came off again. A young mechanic helped me to tinker with it, and on trying to start the nut came off for the third time. The mechanic then conducted me to a shop where an examination showed that the steel disks in the axle which help to hold the clutch to the axle, had been ripped off. The mechanic made new ones and the trouble was remedied.

For the last nine hundred miles it had been impossible to run on the spark. The lowest running speed was 21 miles. The difficulty was to start, but once started the engine ran, with plenty of gas. One can imagine it was no fun riding over rough roads or through the narrow lanes of villages, under such unpleasant conditions.

I had examined the carbureter time and again. I looked to the magneto, the gasoline, the spark plugs, the air. At Monaco a mechanic in one of the garages strained the gasoline I had brought with me from Genoa, Italy, but he declared it to be O. K. After a careful examination of the whole machine, he came to the conclusion that my trouble resulted from the fact that the specific gravity of the European gasoline was greater than that of the American, forgetting that it all comes from Amer-

Napoleon's Tomb in Paris.

ica. Each one to whom I explained my trouble laid the blame to something else, but no one seemed to be able to help me out.

Doctoring the Carbureter.

By a process of elimination I finally decided

that the carbureter was to blame. Still I could not find anything wrong. Most of the mechanics to whom I went wanted to take the magneto apart, but I could not see it that way. When I had explained matters to the mechanic at Valence, he decided to investigate the carbureter. He cleaned it out thoroughly, and as luck would have it, stuck a thin wire through the small gasoline hole in the auxiliary jet. It had become clogged and thus had caused all my trouble. The glasses in my goggles were also replaced and my bill in all was only \$1.05. The work was surely worth it.

I rode on up the Rhone against a fierce wind, which was strong enough to pick up sand and small pebbles and drive them into my face. It was cold. I had lost my gauntlets and mantle in Spain, where it had been very warm. Now that I needed them I found riding anything but pleasant. So in Lyons I bought an automobile coat—the best I could do—and a pair of woolen gloves. Some miles out of the city I stopped at an inn or auberge, paying only two and a half francs for a five-course dinner and a nice room and bed.

In the Chateau District.

The next day I rode through a pretty, mountainous country through Lozanne, Valsonne, Ampleus, Roanne, St. Germain, La Pacaudiere, La Palisse, Moulins and Nevers; then over a rolling country through La Guerche, Nerondes, Bourges and Vierzon. I was anxious to get to Montrichard and Vellieres-les Grands, where an old curé, a friend of mine, lived, so I rode in the night. Some miles outside of Vierzon I ran into a pile of sand. The carbureter became choked and I was unable to ride on. At the next house, which proved to be a chateau, I stopped. The steward kindly let me stop, after I had explained my predicament.

The next morning I was soon with the curé who received me with open arms. Vellieres is a good place to visit the different chateaux. It is in the heart of the chateaux district. Nearby are Chenonceaux, Tours, Azay le Rideau, Amboise, Blois, Chaumont, Chinon and Chambord. I rode by Chaumont, through Blois, along the east bank of the Loire, to Orleans. Then I took the road to Chevilley and Artenay; then over a flat, open country to Ymondville, where I bought gasoline at 48 cents a gallon, and spent the night and had supper at a small hotel for 58 cents.

In the picturesque Chateau District of France.

Here I had to clean the auxiliary jet again as it became clogged with paint in the gasoline, for the cans in which the fuel is sold are painted on the inside, as well as on the outside.

A few minutes' riding the following morning brought me to Chartres, where I visited the wonderful cathedral, the finest and grandest specimen of Gothic architecture in France. Below the cathedral in the crypt is the world-renowned Vierge Sous-Terre, very ancient mural decorations and remarkable stained glass windows of the twelfth and thirteenth centuries.

Parisian Duty Regulations.

A road straight as a die leads to Paris, 85 4/10 kilometers distant. For the greater distance it is bordered by young apple trees, like the German and Austrian roads. The eleven miles' strip to the city is cobble-stoned and pretty rough in places. At the Orleans Gate, on entering Paris, I had to pay 20 centimes a litre for the gasoline in the tank. The Parisian authorities are much wiser than their brethren in the other cities and towns. They will not be cheated of their octroi, that is, their duty. If you want to run your auto or motorcycle in Paris, you must pay the price for Paris gasoline, you cannot go out of the gate to buy the cheaper fuel, free of octroi. For this reason just outside all the gates there are many garages where cars are kept.

My tires were in rather poor condition and rain had made the streets very slippery. Besides my left handlebar was broken, so riding was very difficult in gay Paris.

The brilliantly lighted cafes extend out upon the sidewalks. Here the Parisian takes his drink and watches the gay crowd. No telephone poles disfigure the prospect. Everything is artistic. News-stands are bright kiosks of multi-colored glass. Even theatrical posters are pleasing. Lamp posts are artistic; the houses are regular and uniform.

Perhaps the lodestone that draws everyone in Paris is Napoleon's tomb, under the brightly gilded dome of the Hotel des Invalides. One cannot help feeling somewhat awed by it. Even though one may be perfectly convinced that the world would be better without the soldier, still his heart thrills before military genius and military heroism. Bitter controversies have swept over the name of Napoleon. Praise and blame alike have been heaped upon it; but always the glory of the prisoner of Helena is in the ascendant.

A Record Tire Repair.

The road out of Paris, through St. Denis and St. Brice, for some 18 miles is cobblestone paved and hard on motorcyclists. Then through Beaumont, Grandvilliers, Poix, Abbeville and Montreuil to Boulogne, it is very good. This is the noted Paris-Boulogne route. The country is generally level, with only a few small ascents. Nine miles outside of Boulogne, at 6.30 p. m., when it was already dark, my rear tire received a puncture. The boat

The Arch of Triumph in Paris, One of the City's Architectural Masterpieces.

for Folkestone leaves at 7.10. It seemed that the fates were against me and that I was not to reach the boat that day. I determined, however, to make a try. I located the puncture, repaired it and was on the road again, all in ten minutes. I raced on through the city and to the wharf of the Folkestone boats, which I reached just in time. My personal ticket cost \$1.80 and the machine \$2.41. It was hoisted aboard with great care. On board I cleaned the carburetor. The passage consumed less than two hours, but it was a rough one, and owing to an unstable feeling in the pit of my stomach I felt hardly able to reassemble the parts. On the boat I met a young Englishman, riding a racing model of the Indian. He was of some assistance to me.

At the docks in Folkestone, England, an agent of the Automobile Association and Motor Union, of which I was a member, helped me to pass the customs and directed me to a garage and hotel. At 2 South street I received a neat bed and room, and breakfast the next morning for 2½ shillings, or 60 cents.

Picturesque English Roads.

I took the road to Ashford and Maidstone at an early hour. Eight miles out of the latter town I turned off to Woking, via Ightham, Westerham, Godstone, Red Hill, Reigate and Dorking. An obliging clerk at a bicycle shop gave me these directions. The road, needless to say, is good but very winding and narrow. In Woking I was the guest for that afternoon and night of a young chemist and his wife. I tried to buy a 28-inch tire without success. I could not get even a tire shoe, or "gaiter," as it is called here.

All the next day through Chobham, Bagshot, Wokingham, Reading and Wallingford I inquired for a shoe, as the back tire had three very weak spots. I was able to ride on by winding tape around the dangerous places. In the old University town of Oxford I located one shoe that would fit my tires, 2½ inches. Just out of the town I spent the better part of three hours repairing the inner tube. It seemed as if every repaired spot had sprung a leak.

In Banbury I found another shoe. I reached Warwick at 7 p. m. This is the heart of Shakespeare's country. Within walking distances are Stratford-on-Avon, The Shuttery, Leamington, a watering place; Guy's Cliff,

Lord Percy's handsome country seat; Kenilworth, the loveliest of English ruins, so loved by Walter Scott. I rode on through quiet, picturesque old Coventry, the city of Lady Godiva's famous midnight ride; through busy Birmingham and smoke-emitting Wolverhampton, the metropolis of the Black country. The country from Birmingham to Stratford is a region of factories, the air is black with smoke.

On American Soil Again.

That afternoon I reached the home of my friend, Tom Owen,

who had started me on my trip the preceding July. We spent two days riding around this beautiful country, and then one morning early at 5 a. m. we set out for Liverpool, 65 miles distant. I thought my tires would not stand it, but strange to say I did not suffer a mishap, but my friend had to stop and repair his tire every few minutes. It was about one in the afternoon before we reached Liverpool.

As I had to send my motorcycle to Chicago I recreated it in the crate I had stored, and had the American Express Co. take it to the ship the next day. My friend lives in Boston, so he merely took his machine on board uncrated at his own risk. We paid only \$2.40 freight charges.

After a stormy voyage, during which a man died, one man became crazy and every one was sick, we stepped ashore at Boston, glad to be again in the land of Uncle Sam. I saw the custom officials, had my baggage examined, made for the offices of the American Express Company and asked them to forward my machine to Chicago. And so my trip to Europe was at an end. In all I covered on the motorcycle 4,190 miles. I made an average of 74 2/7 miles on an imperial gallon of gasoline.

CLEVELAND SHOW PLANS

More Elaborate Preparations Are Being Made Than Ever Before for Annual Exhibition Which Opens January 4.

ARRANGEMENTS are now being completed for the eleventh annual automobile show at Cleveland, Ohio, which will be held January 4-13. As in the past, a large section, centrally located, will be set aside for the motorcycle display, and the dealers of the city announce that the two-wheelers will be given a more effective exhibition than ever before. In past years the Cleveland display of motorcycles at the show has invariably been a creditable one, but the committee in charge of the present plans asserts that the 1913 display will be the most comprehensive outside of the national shows in New York and Chicago.

The Cleveland show is to be staged in one of the largest garages in the world, an establishment covering 63,000 square feet and with a storage capacity of 500 automobiles. This building is well located and there is every indication that it will be thronged.

The CLUB

IN MY TOWN

BY FREEMAN JARGO

How a Small Squad Struggled Through Early Vicissitudes, Fought Off Trade and Other Jealousies, Grew in Membership, and Finally Came Into Possession of a True Spirit of Fellowship.—Part I.

BEFORE we actually settled down to business and called an organization meeting of the motorcyclists in our town there was so much enthusiasm on tap that Membership Chairman Estabrook probably would have executed a few pigeon-wing steps by way of celebrating had he known of the conditions, but the first session toned us down considerably. The second or third showed outcroppings of jealousy between several of the officers, and there was noticeable coolness on the part of two agents for rival machines; I think it was the sixth meeting that developed a heated argument over changing the name of the club, and the two succeeding sessions almost put the disorganization skids under us. That we did not enter upon a rapid and ignominious slide to oblivion was due chiefly to the cool-headedness of one officer and a certain sense of sporting fairness with which the boys were blessed.

As we look back now, secure in the possession of our eighty odd members, it seems strange that mere details should have brought our young organization so near the brink of disaster, and that is one of the reasons why I feel that a frank disclosure of some of our troubles will prove of deep interest to other clubs and riders in general. When a club that has tottered on the ragged edge takes a new grip on things and holds that grip until the organization is one of the most active in its State, it is a fairly safe wager that there are numerous helpful hints sprinkled throughout its experiences.

How We Made Our First Mistake.

I believe we had fourteen riders at our organization meeting, and six of these mounted the same make of machine. It was the latter condition that brought on our first hitch. The

six riders referred to felt that they were bound together in a sort of vague brotherhood by the fact that their machines bore the same name, and they began to act as a unit. The vote of one was the vote of all, and in little or no time the riders of other machines were thrown upon the defensive. Two riders of the same make on this side voted together, three owners of another make over yonder held out stubbornly as one man, two others mapped out a little policy of their own and the last member simply rampaged to and fro, voting against every proposal, and accusing the riders of all the other machines of snubbing him because he was the sole representative in the club of his make of machine. As was intimated in the opening paragraph, a more irritating tangle could hardly be imagined.

It happened that our club was organized late in the spring, and after it had been in existence about a month the cool-headed officer above referred to managed to launch plans for a Sunday run to a small amusement place. What's more, he succeeded in having all the boys in line when the trip was started. He paired them off carefully, being certain to have each rider teamed with the owner of another make of machine, but before we had been on

Where Diplomacy Triumphed.

In this fashion we reached the turning point of our run, and a good dinner helped to relieve the tension. After the cigars were going, the cool-headed officer very humbly offered to exchange mounts for a short spin with a rider of a rival make, hinting that his own machine was not up to its best work and that in new hands its failings might be discovered. They made the exchange, rode off smiling and, strange as it may seem, they returned smiling. They had established a bond of sympathy, and from that moment they had plenty to chat about. The cool-headed officer then started a tactful juggling of machines, until every rider present had enjoyed a short jog on another member's mount. He called it a new system of "trouble-hunting," but he really intended it for trouble-chasing, and that's just the way it worked.

Mechanical suggestions were soon passed about freely, makes of machines were forgotten for the moment and conversation turned to the motorcycle in the abstract. At this juncture I detected a covert smile about the lips of the cool-headed officer, and I knew that his first battle had been won. He knew it, too. On the homeward run there was an

entirely different brand of conversation from that which featured our outgoing trip. Each rider had been given to understand indirectly that some one else respected his knowledge of the motorcycle, that he had been placed somewhat in the light of an adviser, and the sensation was an enjoyable one. There's no denying that our energetic officer was a great little student of human nature.

A Start on the Right Path.

This outing marked our start on the right path, but it must not be assumed that it put an end to our tribulations. Far from it. The owners of the various makes of machines were not so clannish from that time on, but evidences of jealousy could not be entirely overlooked. For example, a rider of the machine which had six representatives in the club brought an unusually striking racing pic-

"Our Club Had a Hard Time Getting Rid of the Dragon of Jealousy."

the trail half an hour each make of machine had its own little squad, and the rider of the lone mount was burning up the road ahead in an effort to prove that he did not need the companionship of the riders of any other make. There was conversation of a sort as we rode along, of course, but nevertheless the clan lines were always evident. There seemed to be a woeful lack of enthusiasm.

ture to one of the meetings and suggested that it be used as a wall decoration. Ordinarily there would have been no objection to such action, but the photograph showed this rider's make of motorcycle leading several other makes across the tape, and as might have been expected it was a trouble breeder.

Up stepped the cool-headed officer again. He offered a motion to the effect that no photographs be displayed in the rooms until pictures of each make of machine represented in the club were available. This solved the problem in a jiffy. The officer was fighting at every turn against any seeming display of partiality, and this policy had much to do with keeping the organization in existence in its early days.

The Middle-of-the-Road Policy.

In nearly every club there will be found an influential squad of riders of one or two makes of machines who show an inclination to "run things." In one city a certain make will be unusually strong, and in another town a rival make will seem to have the balance of power. However this influence trends, it is up to the club officers to offset it, to submerge machine individualities and to indicate that the rider who is the sole representative of his make of machine in the club is to be given equal respect and consideration with the rider whose mount is one of a dozen or more in the organization. As has already been shown, this policy applies to pictures of machines in the club-rooms, and it also applies to the positions given the boys when they are starting on a run and to various other small but important details.

After a club run in which one or two of the boys have suffered hard luck, the president or road captain should see to it that no slighting references to these riders creep into the columns of the local papers. Nothing hurts a seasoned motorcyclist like an insinuation that he has been incapable of handling his machine. If the story of the run is given to

the newspapers—and it should be—it may be stated that a certain rider figured in a spill, or acted as the unwilling executioner of a pup, but this can be done without belittling the unfortunate one in the eyes of his club fellows. I have known fairly sensible riders to withdraw from a club because they believed that slighting newspaper references to them had reached the paper through club channels. It is the little things that count, in motorcycling as elsewhere, and the only safe policy is the one which provides that each member shall protect his club and that the club in turn shall respect the feelings of all its riders.

The Influence of Agents.

One of the knottiest problems we had to solve, and it undoubtedly presents itself to every club that is organized, concerned our dealer members. We had three dealers on our list, each handling several makes of machines, and as might be expected there was considerable rivalry between them. Each was on the lookout for any slight advantage that might be gained by one of the machines he represented, and the other two were keen to see that no such advantage was allowed. Indirectly, the club was a business proposition with the dealers and they could not be blamed for seeing the situation reduced to dollars and cents.

As is usually the case, we held our first meeting at the establishment of one of these

dealers, and we felt called upon to mention his place of business when we gave a story of the meeting to the reporters on the following day. This went against the grain with the two other agents, and not until we had held meetings in their stores and mentioned their names in the local papers were they fully appeased. They looked upon the newspaper story as a form of advertising, and naturally each wanted his share of the publicity. Do not infer from this that all dealers are unreasonably mercenary; they are not, and they usually make the most practical and energetic club workers, but in view of the fact that the whole enterprise affects their livelihood it is natural that they should want all the consideration obtainable. What's more, they are entitled to it, but always with the understanding that they should not seek to play club factions—if the organization is unfortunate enough to have any—against one another with a view of working up trade.

(To be concluded.)

SWENSON THE VICTOR.

PROVIDENCE, R. I.—The recent five-mile motorcycle race, held in connection with an aviation meet at Narragansett Park, was won by B. A. Swenson, this city's well-known Indian agent. Fred Peterson was second and A. B. Carlson, third. All the contestants used Indian machines.

WHAT has been the most potent factor in the upbuilding of YOUR club? If the organization had to contend with obstacles in its early days, what were they and how were they overcome? What do you believe should be the chief aim of a motorcycle club?

We shall be glad to give space to letters from club officials and riders in general, dealing with these questions. In the above article the writer touches upon several problems which confront nearly all newly formed clubs, and tells how they were solved in his organization, but there are other problems and other solutions of equal interest. You need not mention the name of your club; simply write a straightforward letter telling how your squad made progress and how its experiences may help other clubs.

MUST HAVE SAFEGUARDS

Thornley Defines Protective Policy of F. A. M. on Board Tracks in Letter to Referee Gates.

THAT the policy of the F. A. M. with reference to protective devices at board tracks is now clearly defined and that the Competition Committee is determined to insist upon the fullest safeguarding of spectators at the big bowls is evident from the following letter recently forwarded to Referee Charles Fuller Gates, of Los Angeles, by Competition Chairman Thornley:

"In order to put races absolutely on the right side, you must represent to the manager of the motordrome in San Francisco, and in Los Angeles, that without delay they must put up an overhanging protection for the public, and you are hereby instructed not to issue any further sanctions to either of these motordromes until such protection has been put up.

"They must have a perpendicular boarding of at least thirty inches, measuring from the top of the incline. From the top of this thirty inches they must have a strong netting overhanging the track at about thirty degrees. This netting must be upon the strongest large-mesh wire fencing, supported by at least six by four beams not more than fifteen feet apart; the width of the overhanging portion to be at least two feet.

"I don't propose to have any accident in Los Angeles or San Francisco like the one that occurred in Newark, N. J. It is to the interest of the managers of the various tracks to see that these precautions are taken, and they are the best that have been discovered up to the present time. I am prepared to go on record as refusing sanction to any track that hasn't such a safeguard."

SNOW DAMPENED MEET.

BALTIMORE, Md.—Howard A. French had planned a fine motorcycle racing programme for Thanksgiving Day, but a fall of snow on the eve of the holiday disappointed the riders of this city and vicinity. Referee William Wood called off the events, owing to the dangerous condition of the track, but finally permitted the running off of an amateur event in heats. Harry Nagengast won the first heat in 3:21:30, and Overton Snyder romped off with the second in 3:12. Nagengast won the final in 3:13. Fred Tie-meyer, of this city, and Tommy Dedge, of Washington, were carded to fight it out for the supremacy of this district, but the condition of the track barred them from competing.

A LARGE crowd of motorcycle fans were present at the opening of the dirt track in Emeryville, Cal., on Sunday, December 1. Practically all the star riders now in the West were slated to compete on this occasion.

HOLIDAY MEET AT TAMPA

Three Events Drew Large Crowd of Speed Fans to Tampa Bay Track on Thanksgiving Day—Marsicano Stars.

TAMPA, Fla., Nov. 28.—"Turkey Day" races were staged by the Tampa Motorcycle Club on the Tampa Bay track, a large crowd of fans turning out for the program. John Marsicano, the city motorcycle officer, showed the way in each event, with Louis Torres pushing him closely in two of them. Torres gave a game exhibition in the 10-mile handicap in which he was on scratch. His magneto cut-out failed, but he continued riding, taking the curves with one hand on the bars and the other covering his air intake. In this way he managed to slow up enough to keep his saddle on the turns, but he was unable to make up the handicap.

Three miles, stock singles: Marsicano, Indian, first; Torres, Merkel, second; Johnson, Harley-Davidson, third. Time, 4:29.

Ten-mile handicap: Marsicano, Indian, first; Torres, Merkel, second; Nowlin, Merkel, third. Time, 15:00.

Seven miles, stock singles: Marsicano, first; Johnson, second; Nowlin, third. Time, 9:32.

MEMBERS of the Salt Lake City M. C. recently journeyed to Ogden on a Sunday run.

SPEAR'S ROAD RECORDS.

EASTERN motorcyclists will be interested in learning that the two outside photographs shown above were not obtained in sparsely settled districts of the Middle West, but in New York State—between Auburn and Seneca Falls, to be more precise. They show roads over which William R. Spear, traveling representative for the Reading-Standard Company, was obliged to make his way on his recent sales-boosting trip through the Empire State and into New England. Mr. Spear reports that in one or two places the "roads" gave little or no evidence of having been laid out by man; they appeared to be endless wallows that could be dignified by the name "road" only because deeply-rutted

wagon tracks were visible.

As the photographs show, Spear's machine was sometimes down to its hubs in the mire, and it may be taken for granted that the rider's efforts to negotiate the ruts—often twelve to sixteen inches deep—resulted in many spills. Still he managed to bring his R-S machine through without a serious accident and without mechanical trouble. He covered over 1,600 miles and suffered only two punctures, both sustained from broken bottles. The centre picture shows Spear in front of a road house near Watkins Glen.

THAT CHATHAM COUNTY SQUAD.

IN the photograph below appear the members of the Chatham County (Ga.) police squad, which

is supplied with three Indian and three Harley-Davidson machines. The squad has established an enviable reputation for "on-the-jobness" and it is likely that another rider or two will be added early in 1913. From left to right the riders are: Chief Porter McFarland, Lieutenant J. H. McGrath, Edward Harley, Paschal Strong, W. O. Dotson and James McBride.

THE panel at the right shows Mike Costello, erstwhile Merkel racer, who has just opened a shop in Yonkers, N. Y.

Claude E. Crout, Agent for M.-M. and Eagle Machines in Hyde Park, Mass., and an Indefatigable Boomer.

WITH THE BOOSTERS.

CUP-WINNER ELLS, of the Elmira (N. Y.) M. C., appears in the photograph with eight other members of the Elmira squad. The cross indicates Ells. At a recent meeting of the club he received the Eclipse Machine Company cup for having won the second annual endurance run of the Elmira M. C.

At the left is shown Art Smith, a prominent member of the Ft. Wayne (Ind.) M. C., who spends as much time above the earth these days as he does on it. Smith is known as the Ft. Wayne "Bird-Boy," and

Art Smith, Ft. Wayne Club's Bird-Boy.

the photograph shows him ready for a flight with the girl who had just become Mrs. Smith.

The small photograph above shows R. C. Crist, wire chief of the Bell Telephone Company, in Trenton, N. J., who finds time to prove himself an enthusiastic motorcyclist between duty calls. In the picture Crist is taking his two little daughters for a Sunday morning jaunt into Trenton's suburbs. This rider was formerly president of the Trenton M. C., and his exploits as a roadster have endeared him to the riders of his district.

MOTORCYCLES are now being used by the Police Department of Spokane, Wash., with remarkable success.

BLOOMINGTON TANDEMITES.

IN the lower left-hand photograph three motorcycle enthusiasts of Bloomington,

Ill., are shown in one of the city parks. The woman rider at the left occupies a tandem seat while her husband, who

snapped the picture, pilots their machine. There are scores of feminine tandemites in Bloomington and vicinity.

ALTERNATIVE FUELS

GASOLINE, 35 cents a gallon! Not just now, but probably in the near future, and not at a druggist's or painter's, but all over the country; such a figure may be low in two years' time. There are about 120,000 motorcycles, 560,000 automobiles, and thousands of motorboats and stationary engines in service in the United States—all using gasoline. Next season these numbers will be larger, and this means that more gasoline will be used. Roughly speaking, if all the motorcycles and automobiles were run for ten hours steadily, in one day the fuel consumed would be nearly 5,000,000 gallons.

Exhaustive Pumping.

Quite a number of new oil fields have been discovered in the last three years, but some are being rapidly exhausted even now. There are wells within 250 feet of each other in some fields, and all are pumping vigorously. The petroleum is being drawn out as fast as possible to supply the demand, and when signs of a slight shortage are evident, prices will soar; gasoline is only *one* product of the distillation, and but a small part of the whole at that.

Market Questions.

Of a given lot of petroleum, gasoline proper only occupies about 2 per cent., "benzine" or C naphtha 10 per cent., A and B naphthas each 2½ per cent., kerosene over 50 per cent., lubricating oil about 18 per cent., and paraffin wax about 2 per cent. There is always a market for gasoline—but 99 riders out of 100 never have it in their tanks at all. The gasoline, so-called, is the C naphtha or "benzine," of which 10 per cent. is distilled, whereas only less than 2 of real gasoline is obtained. The demand could never be supplied by this small proportion, hence our "gasoline" really is naphtha. Again, some of these other products do not find the ready sale that the "gasoline" does; refiners therefore limit the amount of crude oil distilled unless they can dispose of the whole production and not have part on their hands for storage. Hence, a fluctuation in the prices of gasoline and kerosene. The remedy for this is an increase in the price of gasoline until it is commensurate with the loss or reduction on other products. But such a move would hardly be submitted to by users, unless they were forced to accept it; with no other fuel available they would have to.

The Remedies.

Whether a rise in price is due to market conditions or to actual shortage in production, there are two remedies for motorcyclists; more economical carbureters or alternative fuels. Unless widely adapted, the first remedy would effect but a small saving in fuel, and at best would only give partial relief, as a shortage would leave the user nearly as badly off as before. As it is not within the province of this article to discuss carbureter construction, attention will be turned to the question of fuels.

Fuels Available.

At the present time, the following fuels are available as alternates to gasoline: kerosene, benzol and denatured alcohol. These fuels only are considered because they (a) can be manufactured on a large scale; (b) at a moderate price; (c) can be used with varying success in the present motorcycle motor. It would be useless to consider alcohols, whose cost is prohibitive and which are not obtainable in sufficient quantities. The author has divided these into "Natural base" and "Manufactured" fuels, for convenience.

Natural Base Fuels.

(1) Kerosene.—Over five times as much kerosene is produced from a given amount of crude petroleum as of naphtha, hence short of an oil starvation, the quantity would be more than sufficient. For a given motor, the horsepower developed with this fuel has been found to be very slightly in excess in a few cases, but in general it is practically the same as with gasoline. The compression pressure need not be changed but the kerosene, being a heavier spirit than gasoline (0.80 as compared with 0.68) contains more carbon, and the carbureter must be heated in order to thoroughly vaporize all that can be vaporized of the oil. A rather heavy soot is deposited in the cylinder when kerosene is used, but with proper design of carbureters, this can be reduced until no more is deposited than when using

gasoline (naphtha C). At present, there are practically no carbureters for kerosene obtainable for motorcycle use. The fuel consumption is about the same. The price per gallon varies from 10 to 15 cents, in barrel lots.

(2) Benzol, also called benzene.—This is a very important by-product obtained from the distillation of coal-tar. It is the source from which aniline is prepared, and therefore is widely used in the preparation of aniline dyes. After passing through various scrubbers and washers in the refinery, it emerges as an oil of 0.88 specific gravity, and can be used in a gasoline motor with slight pre-heating, as when kerosene is employed. Carbureter changes would be chiefly in the provision for an exhaust jacket and a larger jet opening at all speeds. The consumption is less than that of gasoline per mile, and the carbon deposit is less than that of gasoline. Prices at present are the same as kerosene, but they fluctuate according to the state of the market.

Manufactured Fuels.

(3) Denatured alcohol.—This is obtained by mixing wood alcohol with malachite green or some other deodorant to prevent its being taken "for medicinal purposes." It can be used on gasoline motors without structural change, after the motors have been warmed up, but at nearly 1.8 times the fuel consumption. The power, however, is increased nearly 10 per cent., so that conditions about balance. There is very little of this fuel produced as compared with gasoline or benzol, owing to the revenue laws in this country. Sooting is insignificant, in some cases hardly noticeable in runs with this fuel that the author has made. Better results, however, have been obtained in consumption by the use of compression pressures of 100 pounds and over, but this would involve the re-designing of the motors used on two-wheelers. The price is about 30 cents per gallon at present.

Compared with gasoline, alcohol gives the greatest corrosion of the fuels named, benzol (when not thoroughly refined) coming next. The corrosive action of denatured alcohol is very slight, and of properly refined benzol it is no more than that of gasoline. Corrosion includes valve-pitting, let it be understood. Gasoline and benzol behave similarly under storage, both giving off explosive vapor and getting "flat" with age. Kerosene and alcohol

Table Showing Power Production of Different Fuels.

are much less volatile, and therefore safer to store.

Fuel Mixtures.

Experiments with mixtures of the above fuels have shown excellent results. With a mixture of benzol and gasoline, an automobile at Brooklands, England showed a mileage increase of 26 per cent. over that obtained when gasoline alone was used. The proportions were: 90 benzol to 10 gasoline (0.67 sp. gr.). With kerosene and gasoline mixtures, the mileage per gallon has been increased to a slight degree, at approximately the same consumption of either fuel. But with such a proportion as 66 per cent. of kerosene and 34 per cent. of gasoline, the cost per mile would be

MILEAGE.

less than with gasoline alone. In the cases mentioned the regular carbureters were used. The motor firing the benzol mixture being warmed up, while that using the kerosene mixture was started cold.

The pains taken in developing the gasoline motor have been enormous, but very little has been done aside from isolated experiments.

it is impossible to state. It certainly will not be a mixture of alcohol and benzol, as there is no gain in any direction, and difficulty in combining. There is a big field open to fuel investigators concerning either of the first-mentioned spirits, even though the toes of other industries may be trodden on in the process. This applies also to fuel mixtures.

STANDARD SPEEDOMETER FOR 1913

A NUMBER of interesting and important changes will be found in the Standard motorcycle speedometer for 1913, manufactured by the Standard Thermometer Company, 65 Shirley street, Boston, Mass. For example, a special long axle is supplied, with a swivel fitting attached and adjusted, so that it is ready to be placed on the motorcycle. This axle will replace the one originally furnished with the machine. It has been considered necessary to supply this axle in order to obtain a swivel fitting with sufficient bearing surface to prevent wobbling after short usage. The bearing surface is now three-quarters of an inch long, which is as great as is found in the rocker arms of most motorcycle spring forks, although there is no pressure on the new bearing except the weight of the fitting itself.

Castellated nuts are used on the ends of the axle, and holes are drilled so that cotter pins may be inserted. The swivel fitting is drop forged and is much stronger than the one previously used which was of composition metal. Both the special axle and the forging are case hardened, and this adds to the durability of the swivel fitting bearing. The bevel drive housing has also been made considerably heavier, and a strengthening rib has been added where the rivets attach it to the rigid tube. A new flexible tubing is now being used. It is a product of the Standard company, and is made of a single strand of steel stock, of a special rolled section, which gives exceptional strength. Being patented by the Standard company, this tubing will not be found on other speedometers.

A new device is used in the head which prevents vibration at high speeds. The bevel gears are now made of nicked steel, which tests have shown to be about twenty times as durable as the ordinary steel gears previously used. An adjustable ball bearing is used in the bevel joint, and a ball bearing shaft coupling is used where the speedometer is attached to the head. Handlebar clamps will be furnished on all models which will permit of the speedometer being placed in front of the bar, instead of behind it, if the user so desires.

H.-D. CONTRACTS.

HARRY SVENSGAARD, Harley-Davidson agent at Detroit, Mich., has contracted for 250 machines for the coming season. Another contract for 250 machines has been received by the Harley-Davidson Company from the Enterprise Motor & Cycle Company, of Oklahoma City, Okla. Contracts have also been received from Arthur Ferris, of Utica, N. Y., the Harley-Davidson Sales Company, of Celina, Ohio; O. S. Hitchcock, Toledo, Ohio, and F. L. Jackson, Walla Walla, Wash.

MORE POPE LAND

WITH a view of making extensions in the near future to keep abreast of its business the Pope Manufacturing Company, of Hartford, Conn., has just purchased six additional acres of land adjoining its present plant in Westfield, Mass. The Westfield factory is already extensive, comprising 165,000 square feet of floor space, but there are indications that more room will be needed at no far distant date, and the company is now ready for developments.

ALBERT BROWN received the headlight given by the Topeka (Kan.) M. C. for attending the most 1912 runs.

HINDS BACK FROM TRIP.

ROBERT HINDS, sales manager of the Consolidated Manufacturing Company of Toledo, Ohio, has just returned home from a trip through the east in the interest of the Yale.

Visits were made at Cleveland, Buffalo, Rochester, Syracuse, Rome, Utica, Albany, Schenectady, Boston, New Haven, Bridgeport, New York, Newark, Trenton, Philadelphia, Baltimore, Washington, Richmond and Norfolk, Va., and in every one of these cities indications point to a big increase in business for 1913.

"Those who think that the official estimate of 150,000 motorcycles as the output for 1913 is high, should have been with me on my trip through the east," said Mr. Hinds on his return to Toledo.

"Two short weeks, hustling from town to town, convinced me that if anything this figure will fall short of the mark."

A DEALER'S TEST TRIP

ON a recent trip from Manchester, N. H., to Brockton, Mass., J. E. Forrest Eagle agent at the former place

averaged better than 38 miles an hour. He left Manchester at 7 a. m. and arrived in Brockton at 10.55 a. m. He made stops at Lowell and Boston, totaling 50 minutes, thereby making his actual riding time for the 115 miles just three hours and five minutes. Mr. Forrest returned home the same day, after leaving a contract for a consignment of 1913 Eagles.

IJAMS GOES TO CHICAGO.

R. L. IJAMS, assistant to C. A. Gilbert, Western district manager of the United State Tire Company, has been transferred to the central district under J. C. Weston, with headquarters in Chicago, Ill.

Design of Medal Awarded for Recent Endurance Run of National Capitol M. C., of Washington.

SOME SNAP-SHOTS AT ENGLISH SHOW IDEAS

New Machine and Equipment Features That Have Won Favor With Britishers at Olympia

VISITORS to the English Show at Olympia found so many motorcycle novelties to interest them that it is difficult to make up a list of those which attracted most attention, but the accompanying sketches show a number of devices and equipment specialties indicating the trend of manufacturing on the other side. It is worthy of note that much of the ingenuity of English designers of late has gone into devices for protecting both machine and rider in all-year riding, probably a dozen of the most unique attachments taking the form of improved mudguards and other weatherproofing fittings.

In Figure 2, at the left, is shown a rather imposing mudguard and splasher fitted on the 1913 Triumph machines. This is of such width and stability that it is credited with eliminating the necessity of a special shield over "non-armored" magnetos. Figure 1 shows the novel method of securing the rear wheels on the Humberette with a cotter pin, the device being equally simple and effective.

A type of handlebar mirror, manufactured for use on English machines, is shown in Figure 3. It is being marketed by Dunhill, and is so constructed that it may be twisted to reflect light on any portion of a machine which may need adjustment or repairs at night. Experienced riders who have been called upon to unlimber a heavy lamp or strike matches to locate a source of trouble after dark will appreciate the value of some such fitting. Figure 4 shows an ingenious form of terminal which made its appearance at the Show. It is made up of two sections and the wire is wound around a projecting eyelet after which the two parts are pressed together and the sleeve slipped forward as a retaining case-

ment. Figure 5 shows the L. M. C. kick-starter, high-speed clutch and operating mechanism, and Figure 6 is a new feature of the Montgomery sidecar. It shows a simple and sturdy device for adjusting the height of the rear portion of the passenger attachment, and is proving an attractive feature of the Montgomery product. Figure 7 shows the Davison continuous sight feed lubricator. It consists of a glass reservoir which holds a quantity of oil; this is allowed to flow by gravity to the motor, the flow being controlled by means of an adjustable needle valve. Should it be necessary to inject a whole pumpful at once a simple device will permit of this action. Figure 8 shows the geared-down clutch pedal on the new Triumph machines.

BIG DISPLAYS ASSURED.

A RECENT report from the Automobile Board of Trade shows that more than 2,000 products will be on exhibition during the two weeks of the double New York Show.

DULUTH TO MARQUETTE, MICH.

GEORGE A. NOWAK.—From Duluth go to Superior (5.6), caution at end of bridge (3.2 miles) for under viaduct. From Superior go to Allouez, then to Itasca, Rockmont, Hawthorne, Lake Nebagamon, Mount Vicker, Brule, Iron River and Ashland. Distance 80.3 miles. Caution at danger points (5.8) bridge under viaduct; (31.6) left bend with sandy road; (37.2) sand hill; (52.7) large rock in road; (53.9) another rock; (57.8) steep hill; (58.3) short descent; (60.1 to 60.7) road rocks and bad hills; (63.0) bad hill; (67.0) S-turn; (67.1) log fill; (68.1) turn. From Ashland go to Marengo, High Bridge, Mellen, Glidden, Butternut, Park Falls, Fifield and Phillips, 85.4 miles. Caution spots at (16.0) clay hill, bad bridge and hill in succession. From Phillips go to Worcester, then to Prentice, Spirit Falls, Tomahawk and Rhinelander—65 miles. From Rhinelander go to Enterprise, then to Pelican, Jennings, Crandon, Laona, Padua, Soperton, Townsend, Lakewood, Crivitz and Marinette—132.2 miles. Go to Menominee, across the river. From Menominee go to Hansen Station, then through Wallace, Ingalls, Stevenson, Daggett, Talbot, Bagley, Carney, Nadeau, Powers, Spalding, Wilson, Houles, Indian Town, Harris, Bark River, Narentas, Hyde to Escabana. The distance is 65.4 miles. From Escabana go to North Escabana, then through Wells, Gladstone, Kipling, Masonville, Rapid River, Osier, Trenary, Carlshend, Skandia, Yallmar and Harvey to Marquette—72.1 miles. In general, roads are fair with some good and some poor stretches. The route is most roundabout, but is the best. A more direct route across Gogebic, Ontonagon, Baraga and Marquette (Mich.) counties, might have to be traversed pushing most of the way.

VINELAND, N. J., TO CHATTANOOGA.

C. A. CONNERY.—Go up to Philadelphia through Newfield, Malaga, Franklinville, Clayton, Pitman Grove (toll gates), Woodbury, Gloucester and Camden, N. J. From Philadelphia take route 61 (Touring Number of MOTORCYCLE ILLUSTRATED) to Gettysburg, Pa. Next take route 54 to Staunton, Va. Then take route 93 to Roanoke. From Roanoke go through Salem, Christiansburg, Pulaski, Wytheville, Marion, Abington to Bristol. This follows the Washington Highway. For route from Bristol to Chattanooga via Dandridge, write the American Automobile Association, 437 Fifth avenue, New York. The route can be covered with a 4 h. single, but Southern roads are seldom first-class. Road conditions are given with each tour mentioned.

FRAME RECONSTRUCTION.

LELAND WRIGHT.—We think that Voelker & Campani, Seventy-fifth street, near Amsterdam avenue, New York City, can serve you as regards frame reconstruction. This is a small firm, the junior partner of which is a first class frame-man. To get work of the kind you mention into good hands is very difficult and it does not pay any big company to perform a single reconstruction; hence your lack of success with those you mention.

FOREST EBRIGHT and his sister, of Lyons, Kan., are motorcycling to Decatur, Ill.

ECLIPSE VS. HENDEE**Suit Instituted by the Former for Alleged Infringement of Its Free-Engine Clutch Patent.**

THE Eclipse Machine Company, of Elmira, N. Y., claiming the sole and exclusive right and license to manufacture and sell clutches under United States letters-patent No. 1,018,890 and 1,018,891, granted to Frederick S. Ellett, has instituted suit in the United States District Court for the Eastern District of Pennsylvania (Philadelphia), against the Hendee Manufacturing Company and George S. Maslen, Indian agent in Philadelphia, for an injunction and accounting of profits and damages for the infringement of these patents, the alleged infringement being the clutch used on Indian motorcycles.

It is understood that the Eclipse Machine Company will take additional action against other Indian dealers in various parts of the country.

The Hendee Manufacturing Company, in its turn, has advised all its dealers that it will assume full responsibility in the premises, and defend all such suits in behalf of any dealer against whom action is instituted.

R-S EXPORT DEPARTMENT.

THE Reading-Standard Company, manufacturers of the well-known line of R-S motorcycles, announces the establishment of a thoroughly-equipped export department at Cleveland, Ohio, to take care of its constantly growing business abroad. Desiring to extend to its customers abroad the same service, the same careful attention to details, which have made this line so popular among its agents and customers in this country, they have engaged the services of W. P. Street, one of the best posted export men in the United States. Mr. Street has made a careful study of the conditions to be met in foreign countries and their methods of doing business, and is in a position to supply the wants of the foreign buyer with intelligence and dispatch.

Catalogues will be furnished, and correspondence carried on in the language of the country from which inquiries are received, and if foreign readers will address the Reading-Standard Company, 2015 Corning avenue, Cleveland, Ohio, U. S. A., their inquiries will be given Mr. Street's personal attention.

THE INDIAN IN FRANCE.

NOW comes an Indian invasion of France, the birthplace of motorcycles. At the annual French automobile salon, running at Paris this month, 1913 Indians, both singles and twins, will be exhibited for the first time by the Paris agents, Chartier-Desvarennes & Co., 48 Rue St. Ferdinand. The Indian machine is no stranger in the land of Napoleon, for it has won several important competitions there, most notable of which was the carrying off of the French Grand Prize road race August 25, by Oliver C. Godfrey, who covered 279 miles at 42½ miles per hour.

REPP'S ATTRACTIVE CALENDAR.

B. F. REPP & SON, Bryan, O., who sell Indian motorcycles in that territory, are first in the field with a handsome calendar for 1913. The dominant idea is an excellent oil painting reproduction of Kicking Bear, a famous Sioux chief, a most appropriate subject in this instance.

TORONTO CLUB INDIGNANT.

TORONTO, Ont.—At the last regular meeting of the Toronto club there was a lively discussion regarding the action of Bob Scott who carried off a number of first prizes in private owners' races during the last season. Under the ruling for private owners it is required that the machine be owned by the rider and that it be a stock machine. It was found that the engine Scott had been using was far from being a stock model, and that it had been used in another frame in trade riders' races. It was an exceptionally fast engine and when being examined was found to be a 1912 type with a 1909 piston, drilled out so as to reduce the weight.

As Scott was a member of the club and had been found acting against the ruling of the C. M. A. in an unsportsmanlike manner the members demanded that he be expelled from the club. This was unnecessary as the president had Scott's resignation in hand. Some of the members were in favor of not accepting the resignation but of expelling Scott from the club in order to show the club's disapproval of all unfair work in the racing game. When put to a motion, however, the resignation of Bob Scott, as well as that of his brother, J. Scott, was accepted.

Regarding the obtaining of club rooms Alex MacLean was instructed by the club to go ahead and secure suitable rooms in order that the club be able to have permanent quarters as soon as possible. A committee was appointed to purchase furnishings for the rooms.

As the elections are scheduled by the constitution to come on the first meeting of the new year nominations were opened and those for the various offices accepted. These nominations are open, however, until the next meeting.

HAMILTON'S SUNDAY RUN.

HAMILTON, Ont.—Members of the Hamilton Motorcycle Club enjoyed a run on Sunday, November 24. Their original plan embraced a run to Galt and Guelph and return, but this was changed, as after lunch at Guelph, but 28 miles from home, the sky looked so threatening that they decided to make a bee-line for Hamilton. No sooner had they got clear of Guelph than the rain came down, accompanied by snow. This made the roads about as disagreeable as could be. In ordinary weather they are in fair condition but with a mixture of rain and snow they became so slippery that it was truly a mud-larking expedition. When two rather steep hills were encountered about seven miles from Hamilton the mud made it impossible to keep upright. The riders entered into the spirit of the fun and realizing that they could not get any more mud on them than they carried at the time negotiated the grades at good speed, only one or two being successful.

GOODLOE IN ATLANTA.

T. B. GOODLOE, who has been in charge of the Richmond, Va., sub-branch of the United States Tire Company, has been appointed manager of the Atlanta (Ga.) branch of the same organization. Mr. Goodloe is succeeded in Richmond by J. G. Given.

CARRYING THE GOSPEL.

ONE of the most trying problems confronting missionaries in tropical countries is that of transportation and this has been satisfactorily overcome by quite a few missionaries who have adopted the motorcycle for such service.

FIGURING *the* GRADIENT ^{by} DWIGHT B. PANGBURN

NEXT to "How fast can you go?" the average motorcyclist is most interested in the question: "How does the machine take the hills? Can it take you over everything, and does it do it fast or slowly?"

We all like to tell how our machine took us over a 20 per cent. or 25 per cent. grade "the

chine. On this the dial is pasted or mounted with thumb tacks. At the center of the dial is a small bolt on which the hand or pointer is hung. The weight on the lower end of the pointer must be four or five times as great as that of the upper end in order to get good results. In my apparatus, as can be seen,

time, and if I want to find a grade I merely stop the machine, take out the gradometer and set it on top of the tank, read it and put it back in my pocket. If greater accuracy is desired I use the larger instrument, which clamps to the machine.

Instrument is Easily Adjusted.

Only one adjustment has to be made in preparing this gradometer for use. Place the machine on a level floor or walk, on its tires, and adjust the dial-board or bend the pointer until it points to zero. Then all that is required to find any grade is to stop the machine with the gradometer in position and look at the dial. It will give the grade directly in per cent., whether you are going up or down hill. Of course if desired the instrument may be adjusted to read zero when the machine is on its stand on a level. In this case, however, it must be placed on the stand on the grade for a reading, which adds some unnecessary work. The instrument can not be read accurately when the machine is in motion because of vibration and wind, mainly the latter.

The materials to make the gradometer will hardly exceed 5 cents or 10 cents, and the time required is small, while the satisfaction in knowing the grades is considerable, and the gradometer can be used in connection with the speedometer to find the horsepower required in hill climbing. The following rule will give approximately the maximum horsepower which can be developed at any adjustment of spark and throttle: Multiply the combined weight of the machine and rider by the average speed in miles per hour and by the grade in decimals (4 per cent. = 0.04). This result, multiplied by 0.057, gives approximately the maximum power which the engine will develop at the adjustment of spark and throttle used in climbing the hill.

A SOUTHERN TRIP.

E. G. BAKER and E. W. Meyerrose, of the Indianapolis M. C., are planning to start on a tour to Cuba during the first week in January. The route which they have selected will bring them through practically every Southern State. They will ride twin Indians and use United States tires. Baker is a tester for the United States Tire Company, and Meyerrose is connected with the G. H. Westing Company, Indian agent in Indianapolis.

IT is estimated that there are 20,000 motorcycles in use throughout Germany.

other day," but a good many of us hardly know what a 20 per cent. grade really means. A glance at Fig. 1 will show how the per cent. of the grade (or gradient, for the two words are synonymous) is figured. The average grade is shown to be the vertical distance between the points at the top and bottom, or upper and lower ends of the grade, divided by the horizontal distance between the same

points. Thus the average grade is $\frac{96}{400} = 0.24$, or 24 per cent.; while at (a) the grade, at the steepest part, is shown to be 45 per cent.

A gradometer is, of course, an instrument for telling the grade. There are many kinds of gradometers, ranging from the kind where one gets down on his knees in the road with a spirit level and two or three sticks, and thus gets data for figuring out the grade at a later date, to the kind, called the gradienter, which a surveyor will use if you employ him to tell you the grade. Others use liquids enclosed in glass, so there is danger of breakage, and all require some figuring to get the results in the form of per cents.

A Home Designed Gradometer.

The following description is of a gradometer which I devised and have used for some time very successfully with my machine. It is a handy instrument and eliminates guessing, as it is accurate probably within half of 1 per cent. Its principal advantages are that it can be easily carried and used, and that it can be read directly without any figuring and without leaving the saddle of the machine. The dial is shown in Fig. 2. The picture shows the instrument mounted on the backbone of the machine, on top of the tank, and in operation, showing that the machine is standing on a 17 per cent. grade, which I may add is on one of the best residential streets in the city of New Haven, Conn.

The gradometer consists, as shown in the picture, of a piece of $\frac{1}{2}$ -inch board, about 6 x 8 inches, arranged with a sheet metal clamp to fasten to the backbone of the ma-

chine. The pointer merely consists of a piece of heavy copper wire with two loose turns around the bolt and a couple of feet of the same wire wound in a close coil to get the weight at the bottom. If the coil contains six times as much wire as the pointer the weight will be sufficient for accuracy. Care should be taken to have the pointer swing freely on the center

so as to avoid sticking and consequent error in reading. For general use a smaller instrument is desirable, and for such a purpose I use an instrument which is only 3 x 4 inches over all. This is so small that I can easily carry it in my pocket, which I do most of the

IN adopting a "hands off" policy relative to Canadian dealers who might make application for an F. A. M. registered shop certificate, the Federation has eliminated the possibility of serious entanglements and acted in fairness to all concerned. There is no reason for questioning the ability and willingness of the C. M. A. to handle its family affairs, and the acceptance by the F. A. M. of an application from a Dominion dealer—who for obvious reasons should first affiliate with his home organization—could hardly be regarded as otherwise than discourteous.

IT is quite within the range of possibility that the F. A. M., operating with a limited knowledge of Canadian developments, might in time unwittingly extend its special privileges to a dealer who had been refused such consideration by his home organization, and thus place itself in the embarrassing position of sustaining the individual dealer against the governing body in his own territory. The probable effects of such a contretemps invite most unpleasant conjecture.

ANY Canadian dealer who contemplated registering his shop with the F. A. M. must have had in mind the business to be derived from American tourists who go over the border, and in this respect his ambition is to be commended. We believe, however, that a C. M. A. certificate and registered repair shop sign should and will carry as much weight with an F. A. M. rider on Canadian soil as the emblem of his own organization would carry here in the States. This is as it should be, for the present working agreement between the two associations certainly is intended to imply that the American over the Canadian line, or the Dominion rider in the States, shall expect and receive the same consideration extended to him on his own stamping ground.

CARELESSNESS on the part of a Chicago motorcyclist resulted in serious injury to a pedestrian and led Municipal Judge Stewart to refer to the motor two-wheeler as a "deadly weapon." Of all anathemas hurled upon the motorcycle this is probably the most scathingly unjust. While called forth by the negligence of one rider, it is applied to the motorcycle in the abstract, and thus becomes a powerful and cumulative force by which otherwise liberal-minded citizens are permanently influenced against motorcycles. In the Chicago instance the rider evidently deserved his sentence—thirty days of geological research, with one of the county rock-piles as

a base of operations—but Chicago motorcyclists in general and the trade in that city do *not* deserve the hostility that will be aroused in certain quarters as a result of Judge Stewart's denunciation.

IT is the purpose of these paragraphs simply to point out the responsibility of the individual rider. Tollinsky—our geological friend—is accused of giving his attention to a girl tandem passenger with the result that he ran past a halted trolley car and struck a youth. Had he kept in mind the fact that motorcyclists throughout the country are striving to live down a costly and exaggerated reputation for recklessness, that his actions would reflect, creditably or otherwise, upon his brother riders from coast to coast, he would have kept his eyes ahead and avoided trouble. The accident itself consumed only a few seconds, Judge Stewart was prompt with his "deadly weapon" charge and Tollinsky will be free of the rock-pile in thirty days, but it will require months of perfect behavior on the part of Chicago's motorcyclists to offset the unfavorable influence that has been set at work.

THERE is much to say in behalf of an American motorcycle classic along the lines of the English Tourist Trophy races, and, possibly, a minor argument or two that may be raised in objection. Assuming that there are cons as well as pros, let us have them threshed out thoroughly in order that the Chicago club, which has been sufficiently energetic to take the initiative, may be given a fair working basis. If the Chicago enthusiasts are encouraged to the point of undertaking a national event, the encouragement should continue until the classic has gone down in American motorcycle annals as a success, and this implies practical co-operation on all sides. In short, here is the question, shorn of verbiage and hammered down to bed-rock: Are we ready for the American motorcycle classic?

IF we decide in the affirmative—and from the writer's present angle of vision there appears to be no formidable reason for an adverse decision—we should enter upon the project with a determination to furnish a program worthy of comparison with the famous T. T. races, and we believe this to be the aim of the Chicago motorcyclists. We have riders, plenty of them, who balk at nothing; machines that jog from coast to coast with almost monotonous success, and no end of racing spirit. What else is needed? Let

us put our heads together, metaphorically, at least, thresh out the whole proposition—from the viewpoint of the manufacturer, as well as of clubs and riders in general—and then be fair enough with the Chicago club to say just what we think of the undertaking.

IN a recent hill-climbing program the Toronto (Ont.) M. C. included an event for sidecars, thus affording further proof that the third-wheel attachment is as capable of demonstrating its versatility on this side as in England. There has been no reason to believe to the contrary, of course, but we have been a trifle slow to admit that sidecars have a legitimate field away from the boulevards. In this connection it may be well to note that the winning sidecar outfit in the Toronto event romped up the hill with its passenger, then returned to the bottom and repeated the performance with a second passenger on the luggage carrier. A boulevard outfit? Well, well!

AT latest reports from the Pacific coast Jake DeRosier was said to be in the homestretch, and struggling as gamely to offset his disheartening physical handicaps as he ever labored to overcome the obstacles confronting him on a track. This is saying much. DeRosier has written a stirring page into the history of motorcycle racing in America, and it is the hope of all who know him—personally or through his international reputation—that for years to come he may be permitted to rest on his laurels and keep a fatherly eye upon the youngsters who have taken up the hazardous business of record-smashing where he dropped it.

IN another department of this issue a writer on "Alternative Fuels" advances the opinion that few of us ever really have gasoline in our tanks; that we do our put-putting about the country on a form of naphtha that is easier of production and necessarily more plentiful than gasoline proper. Sh-h-h-h! Let us not suggest to the oil magnates that we have discovered anything. They might consider it necessary to give us our fuel in future with a new name—and a new price!

WATCHING MOTOR THIEVES.

FIFTY motorcyclists, headed by C. M. Tucker, a motorcycle policeman, have banded together in the formation of the Wichita (Kan.) Anti-Motor Thief Association.

The Timely Tipster

CONSIDERABLE literary capital has been made of the peripatetic king who, "with twice ten thousand men, marched up a hill and then marched down again," but the uncertainty regarding his destination is little more puzzling than the policy of certain foreign manufacturers of motorcycles and equipment, who devote years to perfecting a motor two-wheeler and then straightway begin to undo their labor by transforming the machine into an automobile. Not long ago I ran across a print of one of these hybrid outfits—a tidy

little English mount, with a $2\frac{1}{2}$ h. kick in its system—and it had been shorn of handlebars, saddle and divers other earmarks of the motorcycle to permit of its being driven from a sidecar! It cut a pathetic figure, the more so because it had evidently been a mighty competent little roadster prior to being placed on the operating

table by the mechanical surgeon.

AT LEAST one British manufacturer is marketing special fittings for driving the motorcycle from a sidecar attachment, and the idea seems to have a hook in popular favor. The mechanism may be turned up for action in about five minutes; off with the handlebars and saddle, on with a few levers, arms and operating connections, and presto! the motorcycle has sacrificed its identity and become merely a power plant for a rakish-looking cyclecar, or monocar. Something may be said for this scheme on the score of comfort, but its advantages appear to stop there. The outfit makes anything but a striking appeal to the eye, and rumple our fast-thinning hirsute thatch as we will, we cannot figure why any motorcyclist able to throw a leg over a saddle should submit to having his mount mutilated into a more or less mollycoddish mess of mechanism, to the end that he may put-put hither and yon without being called upon to balance.

"DON'T make a song of that economy business," advised my pathfinding partner on a recent chatty jog into the country, during which I had been discussing running expense, "for the rider who is continually worrying about the few gallons of gasoline and oil he burns is going to put a damper on a lot of fun."

No doubt about the weight of the latter argument in the abstract, partner, but as a matter of fact few motorcyclists give more than a passing thought to operating outlay, and we never met one who had reached the worrying stage. That's just the point; too much is taken for granted, and many a rider goes through a season without discovering that his mount would have given him better

service had it been run on about two-thirds of the fuel and lubricant actually consumed.

FOR example, I have before me a copy of a letter printed in an English exchange to the effect that the writer, mounting a lightweight with $1\frac{3}{4}$ h. Clement motor, has averaged 180 to 200 miles per gallon of gasoline! True enough, this mount was a skeleton-like little jigger, scaling only about 80 pounds, but its owner states that it took him over the road at 30 m. p. h. on the level, and that he has recently finished a 400-mile tour on it. It should be remembered, of course, that the gallon of our British cousins is really 1.22, or a little less than a quarter of a gallon larger than our gallon measure, but even this does not prevent the performance of the little Clement motor from being regarded as exceptionally good.

HARKING back for a moment to the stunt of throwing a leg over a saddle, we have just looked up from our 4 finger-power Remington to encounter a visitor from Brooklyn, N. Y., who wants to know where he can sign up with a club that does not go in for road incinerating, whose members are content to jog about, enjoying fresh air and scenery, with never a care for speed. Is there such a club in or near New York City? There may be one, but we are unable to name it off-hand. Our Brooklyn friend owns up to forty-two years, and while spry enough and quite enthusiastic, he admits that the time is past when he feels called upon to burn the crown off a macadam road every time he trundles his mount out for a jaunt. In short, he seeks recreation, with congenial spirits of about his own age, and he suggests that a squad of conservative riders—to be known as The Forty-Five Club, for example—would fit into the metropolitan motorcycle field, the "Forty-Five" referring to the average age of the members.

WE believe this suggestion has working possibilities. There are many motorcycle clubs in which forty-five and even fifty-year-old members are enrolled, but as a rule these more sedate riders must accept the road arrangements of the youngsters, or travel alone; there is no special provision for the middle-aged enthusiast. This problem might be solved by forming a club with the minimum age limit at, say, forty years, thus eliminating the speedster. How many motorcyclists in New York City and vicinity would be eligible for such an organization? Are there a

dozen? If so, the Timely Tipster would like to assist in bringing them together.

I NOTE in an English exchange that manufacturers on the other side have of late been rushing their best machines into all kinds of speed and reliability trials, so that the record-breaking mounts, with all the stains of conflict upon them, would be available as exhibits for the big annual shows. Is there a timely tip in this for American show exhibitors? It has been our aim in the past to stage all the new models at their best, trim and spotless, but our British friends appear to believe that the mud-stained testing machines, fresh from road and track, make an appeal all their own. This policy has its limitations, of course, but I have a hunch that many a rider who would give only passing attention to brand new machines, straight from the factory, would linger lovingly beside a battered and grimy steed that has shown its ability to deliver the goods. The other machines in the show stand would no doubt do as well if called upon, but this one—this battle-scarred snorter—actually has put something across, and no rider with a drop of sporting blood in him can fail to do

it homage. After all, there may be something in the idea.

DURING one of the recent heavy rains the Tipster happened to be a member of a party that trickled lugubriously along a northern New Jersey road. There was no suitable shelter, the going was featured by numerous miniature lakes, and in due time my partner's mount developed an aggravating case of belt-slip. 'Twas to be expected, of course; no belt could be blamed for slipping under the circumstances, but it was none the less irritating. Eight miles from home we encountered a rider with tire trouble and stopped to extend a helping hand—or several of them, if necessary. Learning of my partner's belt-slipping difficulty our new friend dug down into a capacious tool-bag and brought to light some fuller's-earth which he sprinkled liberally on the greasy belt. It was a simple little wrinkle, but it turned the trick, for the belt gave practically no trouble on the remainder of the trip. Fuller's-earth absorbs grease and is therefore a mighty valuable addition to an emergency kit for wet-weather going on belt machines.

WHILE this is not a brand new belt tip, it is one that will bear recalling at this season, when belts are likely to be hard put to hold the pulleys over muddy and snowy roads. I have seen experienced riders use

common earth, and even sand, to assist their belt in gripping, but for obvious reasons these should not be resorted to except in extreme cases. Sand in particular has a ruinous effect on both belt and pulleys, and even when fuller's-earth is used the belt should be thoroughly cleaned as soon as possible after the rider reaches his destination. Speaking of belts, I saw a rider make a neat splice recently with a piece of common hemp rope. His V-belt had parted, and upon being spliced it proved to be too short. No extra belt connector was available, so the hemp rope was called into service. It pulled well, too, and the crafty rider avoided the ignominy of being towed home.

A FEW days back the Tipster figured in some tipping that was not on the program, and the why and wherefore will probably interest some of the boys who are inclined to experiment with sidecars. I had commandeered the sidecar outfit of a friend and was nursing it quite gingerly along a suburban road, driving from the car, when a long clear stretch tempted me to open up a notch or two. This stretch ran into a fairly sharp left turn, and the bus was barking along vigorously when we struck it. Well into the turn—and with little or no warning—the sidecar evinced a desire to stand up on its nose, so to speak, and in another second the driving wheel of the motorcycle was off the ground, doing its prettiest to churn itself out of the frame. An instant later we were back on the road, having avoided a spill, but that unexpected kick-up of the driving wheel is not recommended for riders at all inclined toward neurasthenia.

IT was all simple enough, despite its originality. When the turn to the left was made at fair speed my weight in the sidecar was thrown toward the foot of the attachment and slightly outward, and there being no weight over the driving wheel of the machine, this part of the outfit promptly flew into the air. The tipping tendency on the part of the sidecar was accentuated by the fact that I was leaning forward. That yours humbly was not draped unceremoniously over a nearby barbed-wire

fence was entirely a matter of luck; the good judgment did not figure until we snailed our way back to town and turned the outfit over to its owner. Driving from the sidecar is not such a risky performance, but then there are corners—and corners, and figuring weights and angles on a turn is not always the simplest of tasks.

WHILE I am on the subject of sidecars—a topic of rapidly growing interest, by the way—I want to pass along a wrinkle that came to my attention on the road some time ago. I have heard quite a few of the boys complain of the side stress exerted on the lower rear fork member of the machine to which a sidecar is attached, and at too frequent intervals breaks in this part have been reported. The owner of the machine recently observed had split a piece of ordinary frame

tubing 12 or 14 inches long, and had placed it around the lower rear fork tube, thus affording a bearing of double thickness

where the sidecar lug was attached and distributing the strain. The rider—who has a wide reputation for daring road work—stated that this simple and inexpensive precaution had relieved him of trouble and had permitted him to put his outfit through heavy going that would probably have damaged the machine had the sidecar lug been fastened to the bare tubing.

ALLEGHENY OFFICERS.

AT the December meeting of the Allegheny (Pa.) Motorcycle Club, which was held in the new clubrooms, the annual election took place, resulting as follows: A. V. Lurdell, president; J. B. Cotts, secretary; William Maire, treasurer; Michael Morgan, captain, and Lee Darney and Elmer Reuthmiller, lieutenants. Chairmen and members were appointed to serve on the following committees: By-laws, R. H. Hendrickson, Frank Hoffman and Dr. Baker; House and Rules, Charles Tesner, C. C. Knight, Frank Brasecker, Harry Geisey and E. J. Krause; Publicity, R. E. Brown and O. S. Logan; Entertainment, S. Zeyhel, John McCoy, Wilbert Lupton, A. W. Stark and J. Flanagan; Membership, every member his own chairman; Racing, C. F. Seitz, H. Russell Geisey and Walter Poffifer.

SHOP REGISTRATIONS.

F. A. M. repair shops to register during Thanksgiving week are reported as follows: Redmond's Cyclery (L. O. Redmond), Lindsay, Cal.; W. A. Park, 1512 Eighteenth street, Bakersfield, Cal.; Schenectady Welding & Repair Shop (Edwin Sharp-ley), 509 Union street, Schenectady, N. Y.; Brown Music Company (R. B. Cunniffe), 9119 Commercial avenue, South Chicago, Ill.; Charles B. Jansky, 623 North Vandeventer avenue, St. Louis, Mo.; renewal. Mount Morris Motorcycle Garage (Gus Rotholz), 1491 Fifth avenue, New York City.

AMONG THE MISSING.

A 1913 "5-35" Harley-Davidson was recently stolen from Harlan Hutson, of Minneapolis, Minn. The machine is equipped with 2 3/4 Goodyear tires and a Troxel saddle, and the engine number is 145-C.

C. S. King, 921 Ashland Boulevard, Apartment H, Chicago, reports the theft of his 1912 model Harley-Davidson; motor No. 5281-B.

A 7 h. twin Excelsior, of the 1913 type, belonging to W. S. Farnsworth, sporting editor of the *Atlanta Georgian*, was recently stolen from in front of the office in Atlanta. The motor number is 38485, and the Georgia license is No. 17896. The machine was fully equipped and had a tandem attachment. It is announced that a reward will be paid for its recovery.

NEW PENNSYLVANIA HEAD

H. Wilfred DuPuy Succeeds Herbert DuPuy as President of Big Tire Company—Other Officers Remain.

AT the recent annual meeting of the Pennsylvania Rubber Company, Herbert DuPuy retired from the presidency in favor of H. Wilfred DuPuy, who was elected to that office while still continuing as treasurer of the company. The new office of chairman of the board was created, to which the retiring president was elected. The following officials were re-elected: Charles M. DuPuy, vice-president; Seneca G. Lewis, general manager; George W. Shively, secretary; Charles G. Morrill, assistant treasurer. Herbert DuPuy for some time past has been unable to take an active part in the management of the company on account of his increased responsibilities as chairman of the Board of Directors of the Crucible Steel Company of America.

The readjustment of offices involves no change in the general conduct of affairs. The company's policies, which have proved so successful in the past, will be carried on with the same consistency and energy.

Contracts with distributors now in hand assure an increase for the year of 100 per cent. over the business of 1911. Judging from the tremendous interest aroused by the company's recent announcement of a new process of oil-proofing the rubber used in Vacuum Cup tires, the volume of business for the coming season will develop at a still swifter rate. In fact, the entire production at prevailing capacity is already sold for the ensuing year, practically all the leading jobbers throughout the country having placed orders.

MOTORCYCLES REPLACE HORSES.

AS a result of a recent epidemic which destroyed many horses, the farmers in the vicinity of St. Joseph, Mo., have purchased motorcycles for inspection work and trips to and fro over their farm lands.

ABOVE is shown an outline of the new Goodyear rim gauge, which is designed to simplify the fitting of tires to the new rim types. As the exact sizes have been followed in preparing the illustration, dealers may cut it out, paste it on cardboard and thus make an emergency gauge.

PATENTS

Two New Frame Types;
Springing Devices; an Ana-
tomical Saddle and a Novel
Muffler Design.

STRIPPED OF HANDLEBARS.

A LLEN A. HORTON, of Detroit, Mich., is the patentee of the shaft-driven type of motorcycle shown in the illustration. It features a novel springing system, particularly as regards the rear construction, and embodies numerous other distinctive details. No handlebars are used; the tubing part 2, located almost directly below the upper frame member 1, serves as a sheath for the steering rod (not shown) which connects the steering handle 37 with the front fork. The rear members 17a and 23 make up the rear forks and are connected to the shackle of an elliptical spring on either side of the wheel.

The chamber C is intended for the housing of variable gears of any desired type, with the understanding that they will be actuated by the lever 28. A footrest is shown at 38.

AN ANATOMICAL SADDLE.

IN the accompanying diagram is shown a new type of motorcycle saddle, recently patented by Timothy Shepherd, of Birmingham, Eng. It has an anatomically shaped seat proper, which has been designed from plaster casts taken from average men when in a sitting position, and in this direction

it is claimed to meet the requirements more nearly than any seat heretofore offered. The springing of the saddle is comparatively simple. When a downward pressure is exerted upon the rear of the saddle the arm e moves forward and the springs l are called into play.

SPECIAL PRIMING PLUG

A NOTHER recently issued patent, of interest to motorcyclists and all users of internal combustion motors, covers a spark plug with a special device to permit of injecting a priming charge. It is the invention of Robert A. Stranahan, of Toledo, Ohio. Into the ordinary shell of the plug the priming device is screwed and when it is desired to prime the motor a cap is turned to uncover a priming hole, and to unseat a valve, and the gasoline is then introduced into the nipple from which it passes to the motor through a bore or passage in the shell of the plug. Through this action the priming charge is brought into the cylinder in close proximity to the electrode terminals. When the primer is not in use the valve is seated so as to prevent any leakage during the running of the motor. With the season of cold weather at hand this is a plug im-

A SHOCK-ABSORBER

IN the accompanying illustration is shown a new type of shock-absorber for motorcycles, recently patented by Ambrose B. Anzi, of Trinidad, Col. The rear fork 7 is pivotally connected at 10 to the fitting 11, which is rigidly fastened to the upright seat-mast tube, and the fitting 11 also forms the bearing for the crankshaft 13. The lower rear fork is looped at 14, near its forward end, to avoid interfering with the crankshaft and to permit of free action of the joint 10. The upper rear fork is pivoted at its upper end, and between the mechanism engaged here and that incident to the pivoting of the front end of the lower fork is a cylinder 18, closed at both ends, and pivotally connected at 20 to the fitting 11. A rod or plunger 21 extends into this cylinder, its upper end being pivoted at 22 and its lower end engaged with compression springs housed in the cylinder so that both shock and rebound action is taken up. The action of the load carried between the wheels is to cause the rear fork to swing upward, buckling the toggle brace 8-16, and this buckling is resisted by the upper compression spring in the cylinder, thus permitting the shock to be taken up. When the rear wheel assumes its normal position the other compression spring is called

provement that should earn more than passing attention from motorcyclists.

FITTING TWO SADDLES.

IN order to provide an attachment which will permit of two persons riding side by side on a motorcycle and occupying separate saddles, William H. Bradley, of Portland, Ore., has designed an entirely new type of "sociable" fitting, as shown in the diagram. Running at right angles to the standard seat-post, and making a loop around the horizontal bar of said post, is a double bar system which extends for a convenient distance on either side of the central seat-post and is then turned sharply downward to clamp both its ends around the seat-mast tube as shown at 28. The two bars in the upper arrangement end in a triangular clamp at 17 and from that point a single bar is carried to the seat-mast tube for bracing purposes. The saddles are placed as shown, on the upper horizontal bars, a favorable bearing being provided because of the fact that two of these bars are enabled to carry the saddle weights. The saddles may be moved to or from the main seat-post to suit the convenience of the riders.

into play. When riding the motorcyclist is virtually supported on the main compression spring, though the action against the latter really is upward.

**THE
REDNER
SPRING
AXLE**

A SPRING AXLE

A SPRING axle for motorcycles is illustrated herewith. It is the invention of Webster E. Redner, of Kansas City, Mo., and is operated telescopically through the use of pistons and coil springs. Two dash pots (19 in Fig. 2) are supported by arms of the upper rear fork, and these house two plungers 21, the lower ends of which are secured to the bearing members of the rear axle. As the rear part of the frame moves downward the springs 17 are acted upon, but the downward movement is resisted by the air which is thus compressed in the dash pots 19. By the same token a sudden movement in the opposite direction is also resisted, the plungers in this instance being assisted by the coil springs 18.

The arms of the front fork are constructed similarly to those of the rear fork, and the same shock-resisting principle is called into play. An upward movement of the front wheel acts upon coil springs, and here again the action is resisted by the compression of the air in dash pots. As the wheel assumes its normal position on the road the downward movement is softened by the compression of the air beneath the plungers and the movement is further cared for by lower coil springs, as in the rear springing system.

UNIQUE SPRING FRAME.

WHAT may be regarded as very nearly the limit of originality in rear frame springing for motorcycles is shown in the ac-

companying illustration, which presents a design for which Charles G. Stephenson, of Denver, Col., was recently granted a patent. Stephenson connects the rear frame section with the main frame by leaf springs as indicated, and argues that all vibration must thus be eliminated. The lower springs in this arrangement take the place of the ordinary lower rear fork members, connecting the rear axle with the main frame bearings, while the upper springs are intended to connect the upright rear fork with the seat-mast tube of the machine. The inventor points out that either the upper or lower springing system may be used alone, but for maximum resiliency he recommends the adoption of both sets of springs. That the general arrangement would develop divers drawbacks in extended service would seem to be a natural expectation, and the design is reproduced chiefly because of its radical departure from accepted construction.

NEW FRAME CONSTRUCTION

EDWIN O. HIMES, of Albion, Ind., is the inventor of a new type of motorcycle which departs from accepted construction at almost every point, as is indicated in the accompanying diagram. The Himes machine carries two "bucket" seats and of necessity embodies a highly original form of frame. The latter in the main comprises a pair of L-shaped steel bars, that are upturned in front to meet the head-piece, and sharply upturned in the rear as shown at 4. The rear seat 31, is sup-

ported partly by the upturned rear portion of the frame, and partly by the frame 32, the front leg sections of which are fastened to the side-bars 2. The motor 35 is mounted under the rear seat, its base being bolted on the side-bars 2. It will be noted that the drive is by a short belt to the rear wheel.

The rear frame construction also embodies a spring feature. Leaf springs 39 have their front ends fastened to the outer sides of the rear frame bars and their rear bearings are afforded by bearing eyes 40, in which the spindles of the rear wheel are mounted. Both front and rear wheels are provided with pneumatic shock-absorbers, indicated at 22 and 44. The inventor does not dwell upon the construction of the motor in his patent papers, and it would seem that considerable mechanical juggling would be required to adapt a standard motorcycle power plant to the requirements of the proposed outfit.

Under the front seat is the gasoline tank 51, a tool compartment 52 and a lower compartment 53 in which may be carried batteries and a coil. As the description lacks numerous details essential to the practical operation of such a vehicle it is assumed that the inventor aims only to deal with the frame construction, which in itself is radical enough to be interesting.

SPIRAL EXHAUST TUBES.

IN the accompanying illustration are shown sections of the expansion chamber and the exhaust pipe in a muffler recently patented by Joseph M. Michaelson, of Minneapolis, Minn. The gases are conducted to the expansion chamber in the usual manner, and here cooled and expanded somewhat before passing into the spiral tubes which are enclosed in the dis-

charge pipe. It is the contention of the inventor that the gases passing through these tubes and being subjected to a spiral motion will be cooled to such an extent before reaching the open air that there will be little or no noise. The length of the exhaust pipe and the number of coils in the inner spiral tubes may be varied to suit the types of motor for which the muffler is to be used.

SIMPLE SPRING FORK

STILL another type of spring fork for motorcycles is the invention of Samuel R.

Ridgway, of Birmingham, Eng., and indicates comparatively simple construction. When the front wheel is moved upward by a road shock a lever is so pivoted that the main spring is compressed toward the steering-head and the jar thus absorbed.

BIG DEMAND FOR VANS.

CONSIDERING the fact that the season of snow and heavy roads is at hand, there is a remarkable demand for sidecars, according to late reports from the Majestic Mfg. Co., of Worcester, Mass., and this company has received a dozen telegraphic orders for its new model commercial vans during the last two weeks. Inquiries from all parts of the country indicate that interest in the commercial vans is spreading rapidly and the Majestic company looks for big business in this line.

MINITER TO SELL RAYFIELD.

N. H. MINITER, who for several years has been sales manager of the Stromberg Motor Devices Co., has resigned his position with that concern and is now associated with the Findeisen & Kropf Mfg. Co., of Chicago, as factory sales manager. He will in future handle the Rayfield carbureter.

ENGLISH NOTES

By "BRITISHER"

English Advances in Lubrication; Three Systems That Embody Novel Features, and the Outlook for Others; New Types of Pistons to Minimize Carbonization Troubles in Cylinder.

TWELVE years ago motorcycles and automobiles were all lubricated in exactly the same way. Oil was pumped into the crankcase at the driver's judgment, and was distributed over the engine by the flywheels, the less accessible bearings depending on little holes and traps, which received a certain percentage of the flying lubricant, and allowed it to drip into grooves scooped on the inner periphery of the bronze bushes.

Circulating System of Oiling.

In the last decade practically every automobile designer of any standing has scrapped this very haphazard system. It put an engine at the mercy of any duffer who happened to be driving it; regular lubrication, with so primitive a system, really required the chauffeur to keep one eye glued to a speedometer, and even if he observed the five-mile or the twenty-five mile intervals recommended by the maker of his motor, the lubrication was far from perfect.

From Extreme to Extreme.

FOR a brief period immediately following the injection of a dose of oil the engine was flooded with an excess of the lubricant; during this period the sparking plug would often soot up, and a certain per-

centage of oil would find its way past the rings, soil the valves and adhere in a carbonized form to the piston-head and the walls of the combustion chamber. To this period of repletion there succeeded a short period during which the supply of oil in the crankpit was roughly accurate, and finally, as the moment for the injection of the next dose approached, the quantity of oil in the base-chamber became too scanty, and the danger of seizures or scraped bearings became imminent.

The unsatisfactory nature of this oiling system was further affected by the fact that a headwind, a dirty gauze on the air intake, the presence of extra passengers on the vehicle, the heaviness of the road surface, gradients, the condition of the compression joints, etc., etc., all called upon the driver to vary either the size of his oil injections or their frequency. As an inevitable consequence, ninety-nine drivers out of every hundred oiled too much or too little.

Results of Improper Oiling.

IN the first case, an engine soon got into a filthy condition, and its power oozed away; supercompression began to make its symptoms evident, and the engine had to be disassembled and cleaned. In the latter case, the bearings were soon badly worn, and expensive repairs became necessary; in extreme cases engines were wrecked and ruined. Consequently, some improved system would soon have been developed in any case. But the demand for extracting higher efficiency out of any given size of engine made the problem far more acute.

Engine speeds rose, and engine temperature increased, so that the interior parts of an engine ceased to be covered with liquid green

slime, dripping gently into its appointed channels, and instead the inside of an engine was full of an "oily fog," which could not be relied upon to penetrate minute channels by mere force of gravity. In addition, the increased efficiency of the engines vastly raised the stresses on the bearings. As a consequence handpumping and splash-distribution has long since vanished from high-grade automobile engines.

Lubrication of W. & D. Motor.

The Most Dependable Systems.

THE best modern systems consist of a mechanical pump, which forces oil along myriads of minute channels to every part of the engine which needs lubrication; the crankshaft is often hollow, and conducts a stream of oil under pressure to each bearing; each connecting-rod big-end dips into a trough of oil, kept at a constant level; a tiny tube runs up each connecting-rod to oil the wrist-pin; the oil is filtered at least once on each circuit on the engine; provision is made for the rapid extraction of the filter, in order that it may be cleaned regularly; the lubrication is adjusted to engine loads by devices which increase the bulk of the oil stream in proportion to the throttle opening; and in the latest practice the oil is actually circulated!

A Representative English Cyclecar, the Humberette.

through a small radiator, which keeps it cool.

Without such complex refinements the present world's automobile records could never have been made. It is these systems which enable a big car to average close on 70 m. p. h. for two days in a Grand Prix race, and which have rendered possible the six-hour record on Brooklands track, England, with an 11 h. engine running at over 60 m. p. h. the whole time. In spite of these precautions, coupled with great increases in bearing designs and in huge advances in metallurgy, it is no uncommon thing for a bronze or ball bearing to seize in such races, or for a babbitt (white metal) bush to liquefy.

Motorcycles vs. Motor Cars.

YET the motorcycle remains practically unaffected by the development of car lubrication; 75 per cent. of the world's motorcycles still depend on the old handpump and splash system. As a consequence, the average motorcycle engine requires rebushing after a mileage which any automobile maker would consider ridiculously brief; motorcycle engines call for decarbonization every 1,000 miles, whereas car engines will go through a season uncleaned; and serious engine troubles are far more common on cars than on cycles.

Tokens of Progress.

THERE are, however, some indications that motorcycle designers are waking up. It may be questioned whether the experiences of amateur road riders are the impulse behind the discontent. More probably the popularity of racing advertisement and the strenuous rivalry between different factories in the direction of world's records is the real lift behind reform. Two simple types of mechanical lubrication have at last acquired a certain popularity on stock roadsters. One is the mechanical pump, utilized on several American machines.

When this is properly made, so that it functions reliably, and its pressure does not drive oil out through all the crankcase joints, it is certainly an advance. If it is correctly adjusted it saves the rider from continually watching his speedometer and racking his memory to decide when he last injected a charge. It goes far towards maintaining a constant level of oil in the crankcase under normal conditions. Where it fails is that it adjusts the oil supply to *engine speed*, instead of to *engine load*.

Defects of Mechanical Oiling.

ITS defects are obvious, when we reflect that it feeds exactly the same quantity of oil when

The Bosch System; Note Pumps E.

the engine is throttled down to round a street corner at walking pace, and when the engine is slogging up a precipitous grade with the throttle wide open, and the spark retarded. The retention of an auxiliary handpump is therefore essential, and responsibility is still laid upon the driver; if he is careless, he may

fail to notice that his mechanical pump has gone on strike, and he may fail to supplement the fixed feed with his handpump when the engine is laboring at a low road speed. If on the contrary he is nervous, he will overdo the handpump business. So this type of oiling cannot be regarded as more than a temporary makeshift.

In Great Britain a similarly faulty system is preferred to the mechanical pump supplying a splash feed. British engineers dislike the engine complication introduced by placing a small pump in the crankcase, and they dislike the fact that the pump and its operation are

Two New English Piston Types.

out of sight, leaving the rider to guess from the behavior of his engine whether the pump is in order or not; as weak running might be due to a hundred other causes, over lubrication is bound to result when the rider unjustly suspects his forcepump; while a duffer may not notice the derangement until serious injury has befallen the bearings. Consequently, British makers prefer the sightfeed drip.

A Standard English Type.

A COMMON type operates as follows: On the top of the tank and well forward towards the steering-head is mounted a glass dome containing an adjustable needle-valve. This drip-valve is supplied with oil by a handpump of the ordinary type with an automatic two-way valve at its base. The pump-handle is pulled up by the rider and left up; a spring above the pump piston forces it relentlessly down against the resistance of the thick oil attempting to enter the tiny needle-valve. The dripping oil in the glass dome is clearly visible to the rider, and the rate of drip is adjustable.

This system has the merit of being simple, reliable and visible, but it suffers from an aggravated form of the weakness which characterizes the mechanical pump. The mechanical pump varies the oilfeed to suit engine speed, if it ignores engine load. The dripfeed never varies of its own accord. Responsibility is therefore still thrown on the rider, who must open the needle-valve a trifle to cope with adverse conditions of a prolonged kind, e. g., twenty miles against a headwind, ten miles of climbing, cloggy roads, etc., etc.; in some cases a bypass tap cuts out the drip at the rider's will and enables a full charge to be instantaneously injected.

These systems are coarse and clumsy com-

pared with automobile designs; moreover, for reasons of space the size of motorcycle bearings has rather been reduced than increased to meet the extra strains of the modern engine with its high efficiency.

An Advanced Design

AMERICAN readers may be interested in two advanced designs exhibited at the British Olympia Show this month; they are straws which show in which direction the wind is blowing. The first illustration describes the W. & D. engine, and it is remarkable to notice that this is probably the only engine in the world which has a spotless crankcase; not one single green smudge ever defiles its joints, and it is further the easiest engine in the world to start, because its flywheels have not got to plough through a sea of congealed and soggy lubricant.

A rectangular sump is cast on the bottom of the crankcase, which has no joint below the oil-level; there is a coverplate on one side sufficiently large to permit flywheels, piston and cylinder to be withdrawn, leaving the base-chamber still fixed to the frame of the machine. At the front end of the crankcase a pair of skew gears drive a vertical pump spindle; the pump consists of two gearwheels, which rotate in the oil lying in the sump.

Operation of the System.

THE oil first enters a large filter (readily removable for cleansing), and when filtered enters a distribution chamber, provided with a valve which regulates the pressure. Out of this distribution chamber leads proceed to the vital parts of the engine. Leads go to each of the crankshaft bearings; that on the pulley side ends in a stopwasher, which returns all excess of oil into the sump, where the pump commences to recirculate it. That on the timing gear side has a circular oil groove, terminating in the crankpin, and the crankpin lead ends in a tiny tube firmly attached to a recess in the side of the connecting rod, up which oil ascends to the gudgeon-pin.

Novel Piston Designs

THE two appended cuts show endeavors made to prevent excessive carbonization of the combustion chamber. One plan is very simple and quite efficient. It takes the simple form of mounting all three rings below the gudgeon-pin; their pressure sweeps the cylinder walls clear and prevents temporary excess of oil from rising high enough to enter the combustion chamber. On paper it looks as if the idea would cause underlubrication of the upper areas of the walls, but in practice no such effect is perceptible.

The Bosch Device.

THE Bosch Magneto Co.—who never coquet with rubbishy notions—have brought out a pressure oiler. It consists of a metal cylinder, with detachable top, designed to be mounted either before or behind an engine (like a magneto), and to be rotated in either direction by chain, gears or worm shaft after the fashion of a magneto. The stub projecting shaft, which takes the drive from the engine, operates by means of a worm and central shaft at right angles, which carries cams; these cams actuate the plungers of six small pumps, each with a separate outlet pipe or lead. The cylinder is supplied with oil by a pipe from the standard tank.

TIPS *And* TOPICS

USING a machine with a sidecar involves several departures from solo practice. In the first place, when the sidecar is first attached it should be driven with a passenger in it, and the carbureter adjustments then made. A sidecar attached to a motorcycle means less mileage per gallon, as a richer mixture will be necessary at all speeds, and on climbing hills the difference in consumption will be most noticeable. Personally, I would rather climb hills than ride on the level, and my ideal riding country would be a series of hills with short level stretches between, with a return over a long zig-zag road like they have in the Alps. But to return; be careful to adjust the mixture with the sidecar on and weighted with a passenger, and include a good stiff hill in the run for adjustment.

The Steering Head.

AFTER each day's use of the car outfit, lift up by the handlebars to see if there is any play or shake in the steering-head. You will occasionally find some, and *then* is the time to set up on the cones or bearings. Follow a systematic procedure from the steering-head, somewhat as follows: Forks, front sidecar fitting, intermediate sidecar fittings, rear sidecar fitting, clips on sidecar frame, chair springs and fastenings, breaks in the rattan, cane, etc. Wire up any of the last, using galvanized wire, unless you are a "boulevardier," when ordinary iron wire will do. One of the saddest sights is the sidecar whose chair is absolutely "fuzzy" with ends of cane and patched upholstery.

An Immortal Product.

THERE is a case within a mile of my desk where a sidecar has changed hands three times since August 1, not because of its being poor, but by reason of each successive owner having a smash-up, badly disabling the motorcycle, but hardly even bending the sidecar frame. There is no mark of any kind on the sidecar, and the original owner came to me to find out the name, as it is an imported model. Being without advertisement, it nevertheless is eagerly sought by a fifth rider, who swears that he will not get smashed up with it attached. It is fondly known as the "Killer," as it has been used on four different makes of motorcycles.

Carbureters on Twins.

ANUMBER of riders throughout the country seem to have trouble with the running of their big twins, if their letters are to be judged. I find this is very rarely the case with the rider of a mount whose manufac-

turer fits his own carbureter to his product, but the others say they cannot get the right mixtures except in a small range of speeds. Some of these riders write their letters suggesting larger carbureters as improvements for twin motorcycles, so that there must be something in the grumbling. One rider complains of not being able to get enough air beyond 45 miles per hour, without the aid of an auxiliary air-cock. Another cannot get speed without changing the level of gasoline in the float chamber, and the motor chokes up with too much gasoline when running slowly.

IS THIS trouble up to the makers of machines or to the carbureter folk? To answer this question in each case is merely to guess, and if I take my own experience, I might do injustice to both. On a twin that takes me about the country there was a carbureter and also an air-cock fitted as "regular equipment." The combination was poor, and I obtained an adjustmentless carbureter with no springs or "trimmings" to twiddle. The place of the air-cock is now occupied by a grub-screw, and the consumption has been cut down 15 per cent., with good mixtures from a crawl to the maximum speed possible with the mount. Still, I cannot advise riders to put on this make unless the old one is unsatisfactory, as the cost is pretty steep. But if riders will shout for any necessary change in equipment, they will get it, provided shouting is strong enough.

Single and Sidecar.

QUITE a number of inquiries have come in asking whether a sidecar can be used with a single 4 h. machine, fitted with clutch only. The latest refers to sandy country with steep hills, and I am afraid that short of plenty of clutch manipulation and an occasional "dropping the passenger" progress will not be smooth. Of course, if the grades are moderate, the outfit and passengers can get along with clutch manipulation only, but this has a bad effect on clutches and generally tends toward that unhappy state of affairs

known as a "permanent free engine" when the clutch goes on strike. In a good road section the 4 h. single will take a sidecar anywhere except up abnormal hills, without shedding the passenger. A 5 h. motor or bigger would be better, I think, but with proper gearing it is surprising what a single 4 can be made to do.

Gearing.

IT is rather difficult arbitrarily to set a gear ratio for a sidecar outfit of this kind, but I have found that about $5\frac{1}{4}$ or $5\frac{1}{2}$:1 will do the trick in ordinary give-and-take country. A 6:1 gear will work on some machines and not on others, sometimes causing overheating, but the lower the gear the easier will the hills be climbed. And also, the slower will the speed be on the level. Right here there is a kick coming about fast driving with a sidecar.

What Fast Driving Does.

THERE is not a motorcycle for solo work that is really meant for use with a sidecar, and it speaks well for our motorcycle makers that there are so few strained frames, etc., due to the use of such passenger-carrying devices. The strains and breaks come from two causes: improper attachments and speed mania. The average sidecar owner drives like Sam Hill as soon as he gets clear of traffic and the police, and the twisting of the sidecar frame in relation to the motorcycle has to be taken up by the rear forks and down tube chiefly. The result is that these parts are askew after a short time, and the tires run on one side of the tread, which is very fine for the tire-makers but hardly desirable for the rider or owner. I can speak feelingly as a passenger over rutty roads and cobbles, and never did take delight in watching nuts come off the bolts. There are other little things that are affected by fast running with a sidecar, but I have noted only the most serious, which includes also the breaking of a connection and the resulting smash-up of the outfit and passengers.

MOTORCYCLE DOG AMBULANCE.

IN the photograph is shown a novel motorcycle outfit which often attracts attention on the streets of London, Eng. It is used as a sort of "ambulance" for transporting sick or injured dogs to a hospital which is set aside for their treatment. The hospital attendants make regular rounds of the city, and are also prepared to answer special calls with their motorcycle ambulance. The idea is one that has met with favor in several European capitals. There is no reason why it shouldn't "go" here.—*Popular Mechanics* photo.

DAYTON

Announcing The 1913 **DAYTON**

Some time ago it was given to the public that we would enter the motorcycle field and produce a machine to be known as the DAYTON.

From the inception of our idea until the present day, we have worked faithfully to produce a motorcycle that would be a credit to the far-famed Davis Reputation.

America's foremost motorcycle engineers have approved every line and every detail of the DAYTON. By countless road and laboratory tests it has been tried and found up to the mark of perfection.

The DAYTON is a **new** Motorcycle, but it **is not** an Experiment. We have gathered the best motorcycling talent in the country and united it with our manufacturing ability, mammoth plant and almost unlimited resources. There is every reason why the DAYTON is destined to maintain a firm place in the motorcycling world.

We entered the field determined to consider the Rider's Needs not met by motorcycles in general. We felt the public's pulse and learned what was wanted. The enthusiasm with which the DAYTON has already been met by riders and dealers, is proof positive that we are right.

Knowing that the DAYTON is worthy, we are content to abide by your judgment.

DAYTON

SPECIFICATIONS

Motor	DAYTON 7 H. P. Twin: Bore 3.25 in., stroke 3.67 in., displacement 60.92 cu. in. DAYTON 9 H. P. Twin: Bore 3.50 in., stroke 3.67 in., displacement 70.62 cu. in.	Ignition	Latest armored type Bosch magneto.
Crank Case	One piece crank case and cover, with ground joint. Perfectly rigid and oil tight construction.	Carburetor	Schebler Model H (1 in.).
Bearings	Large annular ball bearings with improved retainers in steel pockets. Connecting rod roller bearings and connecting rods themselves provided with take-up nuts for adjustment.	Transmission	Chain drive with free engine and variable speed clutch with side lever control.
Lubrication	Double oiling system, comprising sight feed drip and force feed pump internally contained in tank.	Gear Ratio	3 $\frac{3}{4}$ to 1, equal to 56 M. P. H. with motor running 2,500 R. P. M. Other ratios if specified.
Valves	Mechanism of simplest construction. Perfect accuracy of timing assured.	Control	Double grip control, designed especially for long wear and extra strength.
		Tank	Gasoline capacity 2 $\frac{1}{4}$ gal. with reserve compartment holding 1 pt. Oil capacity 2 qts.
		Fork	Spring Fork, Suspension Type.
		Seat Post	DAYTON Shock Absorbing Spring Seat Post.

Cam and Magneto Drive

Single forged shaft, cams integral therewith, rotated by worm gears, actuating all four valves and driving magneto.

Muffler	DAYTON, simple and efficient.
Brake	LESTER Center Braking Coaster Brake.
Wheels	28-in. C. C. Type, extra heavy rim for either 2 $\frac{3}{4}$ -in. or 3-in. tire. Front Wheel 36 spokes; Rear Wheel 40 spokes.
Guards	Extra strong, deep and wide.
Tires	United States 28 in. x 3 in., regular equipment. Diamond or Goodyear optional.
Saddle	Troxel No. 1 regular equipment, Persons optional.
Finish	DAYTON Carmine.
Wheel Base	57 inches.
Frame	Extra large heavy gauge tubing, re-inforced with D tubing.
Tools	Complete set in roll, in extra large metal tool box.

DAYTON

When writing to advertisers, please mention MOTORCYCLE ILLUSTRATED.

DAYTON

What Dayton Construction Accomplishes

There are no "Happenings" in the construction of the DAYTON—each feature is planned to meet the Rider's actual need.

The DAYTON Motorcycle is one the Dealer should be in position to supply because it is the one the Rider wants. The Rider wants the DAYTON because it gives him **what he wants** at every point. Note how fully each need is provided for.

POWER

7 H. P. and 9 H. P. Twin DAYTON Motors, developing respectively more than 11 and 13 actual Horsepower.

SPEED

A Flexibly controlled speed with a range of 6 to 75 miles.

COMFORT

The DAYTON shock absorbing spring seat post and suspension type spring fork. Three-inch tire equipment. Perfect balance.

RELIABILITY

Dependable power plant. Staunch frame construction. Positive control.

ECONOMY

Wear resisting at every point because "made right in the start." Efficient motor, minimizing gasoline and oil consumption.

CLEANLINESS

Oil-tight motor. Deep and wide mudguards.

SAFETY

Low center of gravity. Perfect balance. Strong rigid frame fully reinforced with "D" tubing.

TANK CONSTRUCTION

Every rider will appreciate the strongly reinforced, solid bottom, 22-oz., cold rolled copper tank with capacity for 2½ gal. of gasoline and 2 qts. of oil. Note the emergency compartment in the forward part of the tank.

The DAYTON Shock-Absorbing Spring Seat Post is strong, resilient and adjustable to suit the rider's weight.

The LESTER Motorcycle Center Braking Coaster Brake affords great safety and flexibility of control. It is an exclusive DAYTON feature.

The powerful DAYTON Engine will enable you to cover the ground in your own way, slowly if desired, but always with unlimited speed at your command.

DAYTON

DAYTON

Plant of the Davis Sewing Machine Company, Dayton, Ohio

A uniform standard of excellence can be maintained only by the united effort of a complete manufacturing organization. We have ample facilities and high-grade modern equipment. Our successes prove that.

DISTRIBUTING DEPOTS

To facilitate in rendering the best service to the dealer we have distributing arrangements with the following well-known jobbers in the territory indicated:

Central West

The Beckley-Ralston Co., 157 N. Michigan Ave., Chicago, Ill.

New England and New York State

J. W. Grady & Co., Worcester, Mass.

Pennsylvania, New Jersey, Delaware and District of Columbia

Haverford Cycle Co., 827 Arch St., Philadelphia, Pa.

Virginia, Maryland, North and South Carolina

W. H. Grover, Norfolk, Va.

Distribution on the Pacific Coast will be handled direct from our factory branch.

The Davis Sewing Machine Co., 628 Third St., San Francisco, Calif.

How Are You Going To Act On This Matter?

Are you going to let the opportunity of handling the DAYTON slip by, or are you going to investigate?

The DAYTON is a machine that riders are proud to own and one that dealers can conscientiously recommend. Our fifty years' experience is behind the DAYTON.

Nearly everyone is familiar with the various products of our factory. Take advantage of our valuable prestige. Make it pay you a profit.

Mail This Coupon Today For More Facts

The coupon below is for your convenience—sign and mail it today. Every dealer should know the facts. No matter what your plans are, it will pay you to investigate.

DAYTON agencies are being allotted every day. You will have to hurry. A special delivery letter or telegram will bring you the facts by return mail.

THE DAVIS SEWING MACHINE CO. DAYTON, OHIO

I am a motorcycle dealer and interested in your DAYTON proposition. Send me particulars.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

CONDITIONS OF THE CONTEST.

1. All are eligible and each contestant may submit as many suggestions as he desires.
2. The idea submitted must embody an improvement of the motorcycle or one or more of its parts and accessories.
3. Sketches should accompany descriptions, but the former need not be artistic. Rough drawings will serve the purpose. Descriptions, however, should be clear, accurate and to the point.
4. While it is not required, contestants are advised, in addition to accurately setting forth their ideas, to state why and to what extent they consider them as scoring points because of their (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical perfection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.
5. In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.

6. The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.

7. At least one dollar will be paid for every suggestion published.

8. Competitors are requested to address all their communications to Editor Improvement Contest, *MOTORCYCLE ILLUSTRATED*, 51 Chambers street, New York City.

Competitors in the Motorcycle Improvement Contest, and prospective contributors should note that the last improvement suggestions will be received for publication in the issue of December 26, and that the announcement of prize winners will be made in the following issue, that of January 9. Communications and drawings, to be eligible for consideration, must be in this office not later than December 20, so that they may be judged with the final suggestions to be published in the December 26 number.

FRICION-DRIVE MACHINE.

A **FRICION-DRIVE** motorcycle with either a single, double or four cylinder motor arranged longitudinally employs the fly-wheel for the driving member of the trans-

mission. In a special frame is fitted a squared cross-shaft on which is slidable a friction disc, controlled by a lever at the side of the frame. On the end of this shaft is fitted a sprocket which incorporates a friction clutch, and which is operated by a lever on the opposite side of the frame. The final drive is by chain on the right hand side, and a band brake is fitted. The motor is started by a hand crank which acts on the end of the cross shaft. Contributed by S. Gustason, Orient, Iowa.

TWO-SPEED GEAR.

A **TWO-SPEED** gear with dog clutches and fitted in the frame or in a special attach-

ment to it, incorporates two chain drives. One of these is for the high gear, and is situated on

the left side, while the other is for the low gear and fitted to the right side. From the motor a primary chain drives the countershaft on which is a clutch of disc type, and a squared shaft on which slides the double dog-clutch. To the respective sprockets for the two drives are fitted dog-teeth, and the required speed or gear

on each side is connected to a linkage and there is a short vertical connection between the front end or shackle and the link-construction at its triangular portion. The motion is a rocking one, and is similar to that used on buggies for a number of years. Contributed by Edward Pommer, Minneapolis, Minn.

is put into driving action by coupling it up with the dog-clutch on the countershaft. Contributed by F. W. Covill, Salem, Mass.

SPRING FRAME.

FULL elliptic springs are mounted so that with the construction as a whole, they can oscillate around the axis of the rear wheel of the motorcycle. The top hanger of the spring

GEAR CASE BREATHER.

A **MAGNETO** drive gear case, if not vented, tends to force the lubricant out at the aperture through which the armature shaft revolves. Unless proper washers are fitted, the oil will often creep into the magneto, with disastrous results. If a "breather" is placed in the cover, about opposite the axis of the second intermediate gear, the creep of oil to the mag-

neto will be done away with. Contributed by Eugene Coughlin, New York City.

ADDRESSES WANTED.

WE are still without the addresses of R. C. Newman, of Chicago, Ill., and E. L. B. Blank, Pa. We also desire the home addresses of B. A. Waltz, of Detroit, Mich., and B. S. Mackerman, of Chicago. Letters addressed to these contributors have been returned and they are requested to forward full street addresses.

AUTOMATIC SHORT-CIRCUIT.

A SIMPLE and inexpensive device for automatic short-circuiting of the magneto is here shown. To the regular connection on the breaker casing is fitted a piece of 1/16-inch spring wire with its end bent at an angle. When the spark is retarded by the grip, this bent end contacts with the post that carries the spring cover-retainer and effects the short-circuit. Such a device does away with the extra wiring and more or less uncertain switch on the handlebar, it is claimed. Contributed by Wm. A. Pervier, Allston, Mass.

VISITED R-S FACTORY.

EUGENE COUGHLIN, distributor for the Reading-Standard products in New York City and Westchester County, with a number of technical men, paid a visit on December 2 to the Reading factory for a preliminary examination of the 1913 models. A thorough inspection of the plant was made under the guidance of Sales-Manager Atkins and Chief Engineer Franklin Dolt, but weather conditions were such that a personal try-out of machines was out of the question. However, President Deysher and the visitors ascended Mount Penn by automobile as far as the car could be driven with safety, but the road-testers on the new two-wheelers continued on to the top along the slippery mountain road with hair-pin turns. This, by the way, is part of the regular testing ground for the Reading-Standard Machines factory.

WANT SIDECAR PLATES.

IN Massachusetts sidecars are officially classed with automobiles and are required to carry large number plates similar to those carried on the four-wheelers. This does not meet with the approval of the sidecar enthusiasts and they are striving to have the authorities adopt a small metal plate for use on sidecars only.

A RUN IN THE SNOW.

DESPITE the fact that a fine snow covered the roads, a few members of the Queen City Motorcycle Club, of Cincinnati, Ohio, participated in an 80-mile run to Falmouth, Ky., recently.

TANK-FRAME CONSTRUCTION.

A UNIQUE tank-frame motorcycle, fitted with a 12 horsepower side-by-side motor is suggested and illustrated herewith. Unit power plant construction embodies a two-speed gear and large cone clutch, with bevel drive to a countershaft and final drive by chain, amply guarded. The two-speed gear is operated by a

lever at the side of the frame, and the clutch by a pedal on the left footboard. Tankage capacity is four gallons of gasoline and one-and-three-fourths gallons of oil. A spring device is incorporated in the rear frame, and a toolbox is also formed therein. Starting is by hand crank on the right hand side. Contributed by R. C. Darnell, Detroit, Mich.

ONE TOURIST SURVIVES

Nervy Youth Completes 5,000-Mile Trip by Motorcycle from Pittsburgh to Whittier, Cal., but Two Companions Fail.

HARRY E. Patterson, 20 years old, who recently finished a motorcycle trip from Pittsburgh, Pa., to Whittier, Cal., about 5,000 miles, is now entitled to membership in the rapidly growing squad of motorcycle transcontinentalists who blaze trails from coast to coast. Although his trip did not really start on the Atlantic coast, Whittier endured enough hardships in the Middle and Far West to offset the slight handicap with which he started. Patterson's actual running time was 35 days, according to his statements, although he spent 42 days on the trip; seven days were devoted to sightseeing in the larger cities.

When Patterson left Pittsburgh he was accompanied by two other motorcyclists, Ben Davis and C. E. Parker. Davis rode as far as St. Louis, Mo., where he gave up the trip. Patterson and Parker continued. Near Albuquerque, N. M., Parker was injured in a fall from his machine and at latest reports was in a New Mexican hospital suffering from water on one of his knee-caps. From Albuquerque Patterson was obliged to ride alone. The youth states that he encountered the worst roads and most dangerous going in New Mexico, Colorado and Arizona. On one occasion Patterson's supply of gasoline gave out and he was compelled to push his machine 10 miles to a ranch house where he

was fortunate enough to procure some of the precious fluid. The rider's average was about 125 miles per day throughout the trip, and his best day's run was 220 miles.

BALTIMORE AGENTS.

BALTIMORE, Md.—There have been three changes in the trade here in the last ten days. Gus and Bert Heinz, trading under the name of The Heinz Motor Company, have acquired the agency for the Harley-Davidson, formerly handled by the Chase Motor Company. They will open salesrooms at 533 North Howard street the middle of next month. Gus Heinz, who has been the repair man for Howard A. French & Co., Indian agents, will have charge of the mechanical end of the business, while Bert Heinz will be the general manager and salesman.

Edward Holofcener has become the agent for the Yale, which has been promoted here by the Little Joe Wiesenfeld Company.

John S. Bridges, a printer, has become actively associated with William Randall, of the Randall Manufacturing Company, in pushing the Reading Standard and Pope.

WILL COUNTY OFFICERS.

AT a recent meeting of the Will County M. C., of Joliet, Ill., the following officers were elected: William Streitz, president; C. A. Bloom, vice-president; H. F. Stoll, secretary-treasurer.

The Topeka (Kan.) Motorcycle Club is planning to hold a minstrel show in the near future.

QUESTIONS and ANSWERS

ON the whole the Editor of this department was well satisfied with the answers to Question No. 10—"Which is the better method of fitting valves, grinding or truing?" One contributor, indeed, stated that grinding was the better, inasmuch as it was necessary in all cases, whether the valve or its seat were previously trued or not. Truing by means of special devices or in a lathe has been found, however, to result in most excellent finishes for both valve and seat, and no further treatment was necessary. The contributor probably was not familiar with this method of fitting.

The first prize has been awarded to W. H. Ogle, of Moundville, W. Va., and B. A. Waltz, Ford Building, Detroit, Mich., receives the second prize. It should be kept in mind that the awards are based simply upon the best letters received and that the editor of this department does not stand responsible for the opinions advanced.

The series of contests now being conducted in this department will close with the issue of December 26, and announcement of the final winners will be made in the next issue, that of January 9. Contributors should submit answers to each question as soon as possible after its first appearance so that the work of judging and awarding prizes may be facilitated. All answers, and communications referring to the contests, should be addressed to: "Editor Questions and Answers, Motorcycle Illustrated, 51 Chambers street, New York."

Below are given question No. 11, that for which answers are now being received, and the new question, No. 12. Prize winners for No. 11 will be announced in the next issue.

Question No. 11. Why are the cylinders of a twin motor fitted at an angle?
Question No. 12. How can the proper operation of a battery and coil system be best determined?

FRANK

MERRITT

VALVE FITTING.

IN the answers to Question No. 10—Which is the better method of fitting valves, grinding or truing?—there is quite a diversity of opinions among contributors, and the most satisfactory answer was submitted by W. H. Ogle, of Moundville, W. Va., who has accordingly been awarded the first prize. B. A. Waltz, Ford Building, Detroit, Mich., receives the second prize. Ogle's answer was as follows:

"As to whether it is better to fit valves by grinding or truing depends on the condition of the valves to be fitted. In the case of a new valve which is not warped or badly pitted, grinding is all that is necessary, but if the valve has its seat or face pitted or is warped at all, it should first be trued, and then 'ground in' on its seat. The valve seat being generally of cast iron, and the valve faces of steel, it follows that the seat grinds away more rapidly than the face, and unless the iron seat requires much grinding to render it smooth and true, no more should be done than is necessary to get a gas-tight joint."

Winner of Second Prize

Waltz's answer differs from Ogle's, in holding that grinding is inseparable to every fitting operation. He writes as follows:

"The better method of fitting valves seems to be that known as grinding. In all fine engine work today, the final operation is grinding, where absolute truth of surface is sought and every precaution taken to obtain the best finish possible.

"While valve grinding is not an operation of the kind commonly included in the term grinding, it is of the same general character in that the final metal to be removed is by a process of abrasion by fine material. It can easily be understood that such a process is adapted to the final fitting of valves whose parts must be absolutely true to obtain the high duty demanded of motorcycle motors. While machine tools are necessary to give valve parts their approximate form, only by an insertion of some fine abrasive between the valve surfaces and a grinding or 'lapping' operation can the result desired be obtained."

HOLES IN PISTON.

S. ANDREWS—The holes in the second and third ring slots will probably give trouble through leakage inside of the piston body, if the upper ring is not gas tight. Pinning the upper ring so that its slot will not come opposite the holes would be advisable. On the other hand, such a leakage may not show itself for months, and when it does, the crankcase will become hot. It is advisable to plug up the holes, using cast iron in the process.

Regulation of the make of carbureter mentioned, with regard to the position of spark and throttle depends upon whether the whole instrument is out of adjustment. Try for slow speed, using somewhat of an open throttle and retarded spark, turning the needle-valve and closing the throttle until the motor turns over at its slowest pace. This when on the stand. Set for high speed by means of the little ball-

end lever on the numbered arc by the throttle spindle. Do the same when on the road, and you will get the best mixture possible by feeling the increase in the power of the motor as the needle-valve is turned. For slowest speed, the auxiliary air-valve should keep its seat until the throttle is opened. We can only give these general directions, as setting varies with each different motor.

ESTIMATING MILEAGE.

F. H. CHADWELL—We know of but one approximately accurate formula for estimating mileage per gallon for a given motor, which is as follows: $(373,248 \div DE) \times (WS \div 40) = C$. The quantity 373,248 is the number of cubic inches in a pound of gasoline; D is the piston displacement in cubic inches; E the number of explosions per minute; W the weight of the gasoline per gallon; S the speed in miles per hour, and C the mileage per gallon. Expressed in words, the operation is: find the piston displacement and multiply it by the number of explosions (half the number of revolutions) per minute. This result will be the number of cubic inches of mixture per minute. One pound of gasoline makes 216 cubic feet, or 373,428 cubic inches. Divide this figure by the cubic inches of mixture per minute, and obtain a product in minutes. Next multiply this by the number of pounds of gasoline per gallon and get the time value. Multiply this by the speed and then divide by 40, when the result will be a close approximation of the consumption of your motor. It will show theoretically at

what speed the best economy can be obtained. The formula does not pretend to extreme accuracy, and will probably underestimate rather than in the other direction.

For example; a single motor of 30.5 cubic inches ($3\frac{1}{4} \times 3 \frac{43}{64}$ ins.); 2,400 revolutions (1,200 explosions); speed 39.6 miles per hour (5.1 gear). Seven pounds to the gallon of fuel. Find C?

$$373,248 \div (30.5 \times 1,200) \times (7 \times 39.6) \div (40) = C.$$

$$10.19 \times 277.2 \div 40 = 70.610 \text{ miles per gallon.}$$

ACROSS THE CONTINENT.

FRANK J. PEARSON.—Take route from Providence as follows: Route 8 to New Haven; route 39 reversed, New Haven to New York; route 40, New York to Princeton, N. J.; Princeton to Philadelphia via Trenton, Langhorne, La Trappe, Bustleton, Fox Chase and Ogontz; Philadelphia to Gettysburg over route 69; route 54 to Hagerstown; route 99, Hagerstown to Pittsburgh, Pa.; route 145 to Cleveland, Ohio; route 104 to Toledo; route 125 to South Bend, Ind.; route 160 reversed to Chicago.

From Chicago take route 152, Chicago to Champaign; route 162 reversed Champaign to Springfield, Ill.; route 240, Springfield, Ill. to St. Louis; route 239 to Mexico, Mo.; route 230 reversed, Mexico to Kansas City, Kans.; route 243 reversed, Kansas City to Topeka; route 237 reversed, Topeka to Salina; route 236 reversed, Salina to Oakley, Kans.; route 225 reversed to Hugo, Col.; route 246 reversed to Denver. From Denver you will have several alternatives to the coast, the two chief being (1) Route 248, Laramie; 262, Rawlins; 266, Rock Springs; 268, Granger; 264 reversed, Pocatello, Idaho; 273 reversed to Walla Walla, Wash.; 272 reversed, Walla Walla to Seattle. (2) Denver, Golden, Idaho Springs, Dumont, Lawson, Empire Station, Georgetown, Berthoud Pass, Idlewild, Fraser, Coulter Junction, Hot Sulphur Springs, Parshall, Troublesome, Kremmling, Wolcott, Eagle, Gypsum, Dotsero, Shoshone and Glenwood Springs. From the latter place go to New Castle, then to Silt, Antlers, Rifle, Rulison, Grand Valley, Una, and De Beque. Next go to Mesa, Palisade, Clifton, and Grand Junction; then through Fruita, Loma, Mack, Ruby, Shale, Utahline, Cottonwood (Utah), Cisco, Thompson, Green River, Woodside, Big Spring Ranch, Wellington, Price, Helper, Castlegate, Colton, Tucker, Thistle, and Springville. From Springville go to Leland, then to Payson, Santaquin, Starr, Mona, Nephi, Levan, Juab, Holden and Fillmore; then on through Clear Lake, Granite Springs, Ibex, to Garrison. From Garrison go to Osceola, Nev., then to Ely. From there take route 249 to Lida and Goldfield. From Goldfield go to Big Pine, Cal., over the Sierra route, then west across the State to Fresno. From Fresno go through Mendota, Firebaugh, Dos Palos, Los Banos, San Luis, Bell's Station, Gilroy, San Martin, Morgan Hill, Coyote, San Jose, Milpitas, Irvington, Alvarado, San Lorenzo, Oakland and San Francisco.

The third route is the "Trail to Sunset," published by the American Automobile Association, 437 Fifth avenue, New York, price \$1.

WILLARD BATTERIES.

FREDERICK W. STEADMAN.—The Willard storage batteries are made by the Willard Storage Battery Co., Marquette road, Cleveland, Ohio. See the answer to H. De Lander, in the last issue.

THE NEW R-S

(Continued from page 27.)

Special attention has been given to braking systems in the 1913 models. The new 7-8 h. twin and the 5 h. model will both be furnished with two brakes. On the chain-driven models the Corbin V-band brake will be supplied, in connection with a powerful contracting band

brake, working on a substantial drum placed on the re-designed and strengthened rear hub. The latter brake is operated by a pedal which is placed close to the right foot-rest. In the Tourist belt model the second brake acts on the inner side of the rear belt pulley and is operated by a foot lever.

The new rear motor and eccentric bracket is integral, with a greater throw to adjust the chain. This eccentric is clamped on each end, thus doing away with the set screw and eliminating the possibility of the eccentric turning. It is provided with two oil cups, which afford perfect lubrication for the starting crank.

Increased Fuel Capacity.

The gasoline capacity of the twin and Tourist models has been increased to $2\frac{1}{4}$ gallons, an increase of nearly half a gallon over the Tourist size of the past season. The new style of rim permits of using either $2\frac{3}{4}$ or 3-inch tires, and the mudguards have been widened to afford additional protection in riding over muddy roads.

Reading brown is the standard finish, as usual, and an exceptionally rich and attractive effect is produced by the lighter shade of brown on the tank panel, with tasteful striping in black and aluminum. The other standard shade is sylvan green, with tank panel of a darker contrasting shade and the same type of striping, thus producing a beautiful two-tone effect.

Standardization of Parts.

It has been the policy of the Reading-Standard Company to standardize all parts, thereby making them interchangeable. This eliminates a number of special parts and does away with the necessity of agents having to carry in stock a large number of parts and still enables them to supply a part for any of the company's machines. On the single-cylinder models $2\frac{1}{2}$ -inch tires are regular equipment, and $2\frac{3}{4}$ -inch tires are fitted on the twin model. Still larger tires may be arranged for on specification. The Bosch enclosed magneto is fitted and Troxel saddles and the Schebler carbureter are standard on the firm's 1913 output.

WHEELS AND RADIATORS.

JAY W. GOLDSTEIN.—In all probability, you can obtain the size of wheels you desire on the market without recourse to having them built. However, write the Neustadt Auto & Supply Co., 3200 Locust street, St. Louis; W. K. Prudden & Co., Lansing, Mich.; or the McCue Co., 1700 Elmwood avenue, Buffalo, N. Y. The latter house also makes wire automobile wheels. For radiators, try the Neustadt firm mentioned above, or the Briscoe Manufacturing Co., 1427 Woodward avenue, Detroit, Mich.

CANOELET SIDECAR.

M. A. PORTER.—The Canoelet sidecar is made by Messrs. Mead and Deakin, Ladypool Road, Birmingham, England. Its cost is about \$68, f. o. b. Liverpool. As shown, it is fitted to the left side of the machine—the proper side for countries where traffic keeps to the left. It may be that the makers will have to construct a special one for you to fit on the "off" or right-hand side on the motorcycle, for use in this country.

THERE are 810 licensed motorcyclists in Indianapolis this year. Last year there were 600.

New 5 h. single R-S. motor, showing distribution train and integral cam construction.

R-S. cork-insert clutch, showing new type of ball bearings.

DELIVERIES

LAST year the Hirsch Cycle Company of Seattle, sold 50 Harley-Davidsons—all they could get. Their 1913 contract calls for 150. At this writing we have shipped 58 of these to them, all 1913 models of course, and it is only seven weeks since our announcement was made.

The Hirsch Cycle Company got their contract in early. They specified definite delivery dates. The result is that they received the machines when they could sell them with practically no effort.

Other dealers in Seattle have not received their 1913 demonstrators, to say nothing of making deliveries to regular customers. The Hirsch Cycle Company will probably have their whole allotment sold before the other fellows have made a decent start.

Our Seattle dealers are wide-awake people. A three to one increase in sales in one year tells its own story. But this bigger business would be impossible without the co-operation of an organization like ours. No maker can compete with us when it comes to real service.

As usual, we are on the job ahead of the rest. We are making immediate deliveries on both singles and twins on all contracts where definite delivery dates were specified. Is any other manufacturer doing this? Are you hooked up with the right people?

Harley-Davidson Motor Company

Producers of High-Grade Motorcycles for Eleven Years

321 C Street

Milwaukee, Wisconsin

NEW THREE-WHEEL MACHINE SOON

Commercial Motor Company, of Minneapolis, Will Produce Standard Chassis with Four Body Types, Two for Delivery Work, One for Mail Collecting and One for Pleasure Service.

MINNEAPOLIS, MINN.—The Commercial Motor Company, of this city, has been organized for the purpose of placing on the market a newly-designed machine with four body types, suitable for both commercial and recreation uses. Only one chassis will

H. F. TURNER.

be built and the body will be fitted to specification. There will be one enclosed delivery body of large capacity, one open stake body for larger and heavier materials, one special body with drop-out side chute and hopper bottom, for mail collecting, and a passenger body with a double side-by-side seat for taxi or pleasure service.

The organizer of the new company is H. F. Turner, until recently associated with the Minneapolis Motorcycle Company as sales manager. Mr. Turner will be general manager of the Commercial Motor Company. It is announced that Mr. Turner evolved the general chassis design after close study of the demands made of small commercial vehicles, and it received the finishing touches at the hands of three experienced engineers. The construction is simple and sturdy; the number of parts has been reduced to the minimum, and the lines of the vehicle are pleasing.

The frame is of light, triangular channel steel, and the front axle is drop-forged throughout; springing is by four cantilever springs 24 inches long and 2 inches wide, two on the front axle and one on either side of the rear axle. The motor is of the single-cylinder type and generates 5 horsepower. It has mechanical inlet valves, and is fitted with Bosch magneto and Schebler carbureter. Chain transmission is used, with two-speed, a single lever operating the clutch and gear-shaft. Wire wheels are used throughout, with 28-inch rims and 3-inch tires. The Eclipse clutch is standard equipment. Cooling is assisted by a blower on the motor. Steering is by a 12-inch wheel; spark and throttle controls are at the top and the gear shift lever is on the column. The driver occupies a leather-covered aluminum seat with a spring cushion.

The office of the company is now located at 47 Security Bank building, Minneapolis, but shortly after January 1 it will be moved to the new factory.

HENDERSON A DIRECTOR.

AT a meeting of the Board of Directors of the Twentieth Century Manufacturing Co. on November 14, Manager J. G. Henderson was made a member of the directorate. Reports submitted that this session indicated that the Twentieth Century business has never been more promising, and preparations are being made on an extensive scale for the prompt filling of orders.

Charles F. Brooks, of the Twentieth Century staff, returned recently from an extended business trip on which he touched at many of the larger cities throughout the West and Middle West. He experienced no difficulty in marking his trail across the country by a string of good-sized orders.

IN INDEPENDENT SHOW.

FEARING that a recent announcement regarding its Show plans might be interpreted to mean that it will not be represented in the independent motorcycle exhibition in Chicago, the Bosch Magneto Company an-

nounces that it will have a large stand there, centrally located, at which an unusually interesting display of Bosch products for the motorcycle will be shown.

C. C. RIMS ON THE DE LUXE.

AN error crept into the article on new rim types, published in the November 28 issue, when it was stated that the De Luxe machines, manufactured by the Excelsior Cycle Company, of Chicago, were being fitted with B. B. rims. As a matter of fact, the De Luxe carries C. C. rims, and reports from dealers indicate that they are meeting all the requirements.

YALE ECONOMY.

DR. S. W. CLARK, of Sterling, Ill., reports that he has traveled more than 7,000 miles on his Yale motorcycle during the 1912 season and has never had to tinker in any way with his engine. His machine has the extra-large tires that characterize the Yale and he claims they are good for another 7,000 miles.

ECLIPSE ADDITION

Necessitated By Remarkable Popularity of Eclipse Products—Three Hundred Employees.

WITH the completion of the latest additions to its rapidly growing plant, the Eclipse Machine Company, manufacturers of Eclipse clutches, brakes, hubs and fork heads, will have added more than ten thousand square feet to the floor area of its factory. The new structure will include a machine shop with twenty-five new automatics and inspection and stock rooms. Hardly more than a year ago, the Eclipse Company had in its employ 125 men; now its employees number upwards of 300, all engaged in manufacturing equipment for motorcycles and bicycles. The growth of the company's clutch business has been especially rapid, so that to-day Eclipse clutches are known and popular in practically every American locality in which motorcycles are used. The company has been handicapped by lack of proper manufacturing facilities in the face of this big demand for Eclipse clutches. The additional space and machinery, however, will provide more than sufficient equipment for all possible 1913 requirements.

HAVERFORD BRANCH IN DETROIT.

A BRANCH of the Haverford Cycle Company will be opened this month in Detroit. It will be in charge of E. C. Kicherer, well known to the trade by reason of his having been identified for many years with the N. S. U. Motor Company, in New York. The branch will be established in a central location on Woodward avenue. The store selected has a frontage of twenty-five feet and a depth of ninety feet, including a basement of the same dimensions. Mr. Kicherer, besides carrying a complete stock of parts and accessories, has practically closed arrangements for distributing agencies, covering the entire state of Michigan, for two leading machines. The equipment of the branch will be such as to make the store one of the finest of its kind in the country.

Mr. Kicherer has severed connections with the Sun Motor & Supply Company, of New York, having sold out his interest to John Lentz. The latter has moved to Detroit and leased a store at 206 St. Aubin avenue, where he will carry a complete line of N. S. U. parts, and also conduct a repair shop, with special facilities for taking care of the requirements of N. S. U. riders in all parts of the country.

DE LUXE AGENCIES.

THE following dealers have recently contracted for 1913 De Luxe agencies: Hirsch Cycle Company, of Seattle, will handle the De Luxe in Northeastern Washington; the Santa Fe Trail Garage, of Dodge City, will push the line in Southeastern Kansas; Peter H. Lowman, of Warren, Ohio; the Wilkauke Cycle Supply and Sales Company, of Milwaukee, have closed for the entire State, and Charles H. Nelson, of Rapidan, Minn., will handle the line in Blue Earth County.

CLINTON WOLF, of Taneytown, Md., and C. B. Schnepfe, of Havre de Grace, Md., are local F. A. M. appointees.

ANNOUNCEMENT

A Motorcycle Coaster Brake That Is Strong Enough to Hold an Automobile

For some time past the motorcycle trade has felt the need of a coaster and braking device of sufficient power, strength and efficiency to give the rider control of high-powered machines.

The 1913 New Departure will do this and then some. It doesn't require much effort by the average rider to exert a back-peddalling pressure of 75 pounds. In this new model such a pressure will give A BRAKING FORCE OF

MODEL L

1913 New Departure Motorcycle
Coaster Brake for Belt Drive Machines

ONE AND ONE HALF TONS in the rear hub—a power sufficient to stop an automobile.

The action is positive. There is no possibility of locking. The mechanism is heavy—stronger than necessary.

Every motorcycle expert who has seen it says it is the ideal brake—just what rider and manufacturer have been waiting for. Fully described in new catalog, send for your copy today.

THE MOST POWERFUL TWIN MADE

Since our 1913 announcement appeared two weeks ago we have received two or three sacks of mail every day—all inquiries from persons who want to know more about

THE FLYING MERKEL

The Only Self-Starting Two-Speed Motorcycle in the World

The 1913 Flying Merkel embodies every feature that could be desired in a motorcycle, and many exclusive features hitherto believed impossible to apply to a two-wheeled vehicle. The wonderful Self-Starter, Two-Speed Free Engine Hub, Hess-Bright full Ball-Bearing Motor, the Original and ONLY successful Spring Frame, low saddle position, Mechanical Valves and many other features.

Exhaustive tests have proved the 1913 Flying Merkel the most powerful motor made. The twin has climbed hills that no other motorcycle ever before has conquered, while the single can romp up tortuous grades that some big twins have difficulty in surmounting.

The 1913 Flying Merkel universally has been acclaimed the sensation of the motorcycle world. Ask the most successful dealer in your town—he represents the Flying Merkel, or write direct to us for 1913 advance catalog.

KOKOMO, IND.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1896.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

28-30-32-33 Rose Street NEW YORK CITY

"To the Victor Belong the Spoils"

Mr. W. T. Marsh, of the American Motor Co., Brockton, Mass., one of the staunchest adherents to the "lost cause" of the belt drive, has unconditionally capitulated to the irresistible arguments put forth by us, and has placed an order for

"THE COVENTRY" CHAINS

to fill his season's requirements.

This is more significant than appears on the surface. It means that not only have the facts put forth by us taken firm root in the minds of the motorcycle public, but they have also influenced to a large extent the transmission plans of the motorcycle manufacturers themselves.

In taking up the cudgels for the chain in general, we have assumed a position of leadership in the chain field which is rightfully ours. While our advertising has considerably helped every chain manufacturer, we rely upon the reputation of "The Coventry" Chains as a

high-class product in every way—as the strongest, fastest, most durable and most silent chains made—to receive the preference which is theirs BY RIGHT OF MERIT.

WISE DEALERS ARE CATALOGING "THE COVENTRY" CHAINS.

THREE CENTS A WORD

Clark Motorcycle Starter

A NEAT and compact attachment for the carburetor, that starts the engine without excessive pedaling, reduces carburetor trouble fifty

per cent and cuts down the gasoline bill.

[Price, 75c. each]

Clark Acetylene Tank Brackets

Model "A," designed specially for Excelsior Motorcycles, fastens to the handlebar in a rigid position and does not allow the slightest movement or vibration of tank.

In setting tank into the brackets, an eccentric arm is pressed down and holds tank solid. No screws or bolts to tighten or loosen. Tank can be removed in a second by releasing eccentric arm. The tank in this position does not interfere with any other attachment on the machine. Furnished complete with steel bands and necessary bolts for attaching. State Model of Motorcycle when ordering. Price, Highly Polished Nickel Plate, \$2.00 per pair.

"A DOLLAR IN THE LOCK IS WORTH FIFTY IN THE REWARD"

"Motorcyclist's Book of Proverbs"

¶ Keep your name off the list of "Stolen Motorcycles." Almost daily you see mention of another machine stolen. Laws against motorcycle thieves are weak and the only way to thoroughly protect yourself is by locking your machine so it cannot be moved except by YOU—and the only lock that prevents machine being moved and that cannot be picked, pried or cut, is the "SABO."

¶ You can safely leave your motorcycle anywhere if you have a Sabo lock. It fits tight to the frame—cannot be pried off—there are no chains to be cut by pliers. You've got the goat of every motorcycling "Jimmy Valentine" that wants a ride on your gasoline. The lock is scarcely noticeable. The would-be thief will perhaps not see it; will walk up to the machine acting as if it were his own. But when he tries to move it from the stand he'll learn "Sabo's on the Job."

¶ It's made of bronze metal, neat, simple, strong—fits your smallest pocket—lasts forever. The stand is locked securely to the frame—the machine cannot be moved while the lock is there—no danger of breaking spokes or chain by forgetting the lock and pushing machine from stand. It is impossible to wheel or ride the machine away.

¶ We prefer to have you buy from your dealer, but, if he does not have it, send this order blank with a dollar and the lock will come back to you, satisfaction guaranteed, prepaid, by return mail.

JOBBERS

List this in your 1913 Catalog. Cuts, literature and advertising matter furnished. Write for proposition.

Thor MOTORCYCLES

WE ARE THE ORIGINATORS OF CHAIN DRIVE MOTORCYCLES

Remember the *Thor* is not an experiment. We have again proven during the season of 1912, just passed, that quality counts, hence the demand for *Thor* this year.

The trade-mark *Thor* is recognized as being the standard of quality and originality; in fact, the best motorcycle made. It is most perfect in design, mechanically correct and most durable for all kinds of service. The best proof of this is to ask the man who rides one.

A discriminating buyer will be satisfied with no other. It is the chain drive that gets there—it is invariably the *Thor*.

MODEL "13-M" \$225.00

This 4 H. P. model is the fastest single cylinder ever manufactured. This is even faster and more powerful than our previous models of the same size.

Immediate delivery can be made on our 4 H. P. Single; Twins commencing December 10th. Advance catalog ready.

We are now considering applications for agencies.

Brown Scientific Non-Deflating Pneumatic Tube

AN AIR-FILLED MOTORCYCLE TUBE POSSESSING VERY UNUSUAL FEATURES:

First: It withstands a tread puncture without deflating the tube.
 Second: The higher the pressure the tighter the puncture closes.
 Third: It eliminates the risk of destroying casings by reason of punctures.
 Fourth: The danger of loss of control of machine is removed.
 Fifth: It assures you of not being obliged to repair a puncture on the road and gets you "there and back" on full tires.

AIR FILLED ONLY.

Punctures are self-closing by reason of a scientific but simple principle of construction.

NO "DOPE," GUM, PASTE OR OTHER STUFFING MATERIALS.

Write for prices, full description and sectional sample.

You May Have Suspected It BUT WE SAY TO YOU NOW!

**"The Proof of the Pudding
is in the Eating"**

The proof of the *Motorcycle* is the riding, whether you consider a little jaunt like from St. Paul to Buffalo and return (2700 miles), carrying two, with no trouble or repair expense, or 10,000 miles covered with a repair expense of 70 cents, proofs of *Emblem Efficiency* or not. When you ride one you will at once notice the difference.

The wonderful shock-absorbing construction makes it ride like an Automobile De Luxe.

The remarkably powerful silent motor gives you a world of speed which is available even on rough roads (the bumps don't jar).

The EMBLEM outwears most of them and rides easiest of all.

Twenty years experience has taught us what the most exacting rider demands.

The 1913 EMBLEM has it all

Concentrate

IN your selection of various equipment, do not overlook your motor; at that point concentrate your attention, for no matter what refinements you may select, your motorcycle cannot be satisfactory without a thoroughly dependable ignition system.

BOSCH

MAGNETO and PLUGS

are considered standard throughout the entire world. They have met the demand for an ignition system of permanent reliability and efficiency; one having all those features required by the most exacting engineers of the gas engine industry. With this reputation you can be positive that Bosch Magneto with Bosch Plugs will serve ignition to you to your entire satisfaction.

Be Satisfied

Specify Bosch

BOSCH MAGNETO COMPANY
223-225 West 46th Street New York

Your Motorcycle

should be equipped with chains that will stand up under all conditions. You can depend upon the "Whitney" Chain whether in rain, mud, sleet or snow; they are always on the job. They give the maximum amount of service because they are made by men with years of experience in chain making.

When making replacements insist on a "Whitney."

*"Whitney" Chains
Are Built for Strains*

The Whitney Mfg. Co.
HARTFORD, CONN.

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

Comes in half-inch or metric sizes. Your dealer will supply you—or sent prepaid on receipt of price and size.

PRICE—\$1.00 per plug

Our guarantee—"Your money back or a new plug, unless you are absolutely satisfied."

JEFFERY-DEWITT COMPANY

55 Butler Ave.

Detroit, Mich.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

WRITE US FOR FULL DETAILS

The Neverout
TRADE MARK

Gas Lighting
Outfit

FOR MOTORCYCLES

Many attempts at gas lighting of motorcycles have been made. So few of them were successful that both manufacturers and users of motorcycles importuned us to design a motorcycle gas lamp and generator that would be really effective. They knew the reputation of the name NEVEROUT in the bicycle, the carriage, the auto and motor boat field—and they wanted lighting apparatus just as good for their motorcycles.

To produce it required exhaustive tests, but our past experience and our equipment have enabled us to produce and endorse the NEVEROUT motorcycle headlight and generator shown here. Efficiency, simplicity, reliability and elegance of design are combined in this apparatus. Write for literature.

***Four Models—Four Prices—One Quality
of Material and Workmanship***

The Pope Line for 1913 is thoroughly up-to-date and thoroughly cosmopolitan. There is a model for every present or prospective type of rider and for every individual taste or personal preference. The prices are right—the machines of the very highest quality—and the range is wide.

Analyze the demand as you know it, and see how completely the various models in the Pope Line listed above, meet it. Four Distinct Models, Four Prices, ONE QUALITY.

OVERHEAD VALVES—make for High Compression, Quick Ignition, Positive Exhaust, and Direct Downward Thrust of the piston. This is the same principle applied so successfully in the design and operation of Pope-Hartford automobile engines, which are probably unequalled by any other motors of their size for power and efficiency. Similarly the Pope type of valve-in-the-head motorcycle engine develops the maximum of power for its dimensions.

ANNOUNCEMENT

A Motorcycle Coaster Brake That Is Strong Enough to Hold an Automobile

For some time past the motorcycle trade has felt the need of a coaster and braking device of sufficient power, strength and efficiency to give the rider control of high-powered machines.

The 1913 New Departure will do this and then some. It doesn't require much effort by the average rider to exert a back-peddalling pressure of 75 pounds. In this new model such a pressure will give A BRAKING FORCE OF

MODEL L
1913 New Departure Motorcycle
Coaster Brake for Belt Drive Machines

ONE AND ONE HALF TONS in the rear hub—a power sufficient to stop an automobile.

The action is positive. There is no possibility of locking. The mechanism is heavy—stronger than necessary.

Every motorcycle expert who has seen it says it is the ideal brake—just what rider and manufacturer have been waiting for. Fully described in new catalog, send for your copy today.

The Reading-Standard Is a Worker

The above illustrations give an idea of the roads for which each Reading-Standard must qualify before it is permitted to leave the factory.

It is a well-known fact throughout the motorcycle industry that no motorcycle is so exhaustively and unrelentingly "weighed in the balance" by its manufacturers, as the R-S.

Our slogan, "Built and Tested in the Mountains," is not an empty phrase. Behind those simple words lies a world of meaning. If every prospective buyer of an R-S could but see the terrific hill-climbing trials, the stern endurance and economy tests which each R-S must undergo, he would cease to wonder at the marvelous perfection of the R-S he buys.

Not in empty words, not in sounding phrases, but in performances does the true quality of a motorcycle manifest itself and on the indisputable evidence of PERFORMANCE do we rest the case of the R-S.

We appeal to you for a verdict

1913 "Big Y" Makes Good Every Claim

1913 model two-cylinder Yale motorcycle. Rated at 7-8 h. p., but actually pulls 9.2 horsepower on block test. Cooled by horizontal cylinder flanges in line with air currents. Bosch enclosed magneto. Heitger carbureter. Yale cushion fork. Y-A shock absorber, the "original jolt-killer." Three-inch tires, automobile size. Hinged mudguard, with large clearance to allow use of tire chains. Belt or chain drive with Eclipse free-engine clutch. Price, \$275.

ON the road the new Yale proves to be everything the buyer had expected. We have said much of the speed, power and dependability of the "Big Y," but the machine backs up every claim by actual performance. Here's a telegram from Texas that tells its own story:

NIGHT LETTER.

THE WESTERN UNION TELEGRAPH COMPANY, HOUSTON, TEXAS.

The Consolidated Manufacturing Co., Toledo, O.—Model 37 received today and tried out; it more than fulfills our expectations and to say that we are pleased is but mildly expressing our sentiments. Please accept our earnest congratulations. The 1913 Yale is King of them all, bar none.

YALE MOTORCYCLE SHOP,
H. L. FLAKE, Sales Manager.

There is profitable, solid satisfaction in selling a motorcycle that makes good in this way. Our big advertising campaign is telling more than ten million people how the "Big Y" makes good, and live Yale agents are reaping results right now by taking orders in record numbers. If you haven't contracted yet, write us quickly, for not many more 1913 agencies can be accepted.

Consolidated Manufacturing Company, 1730 Fernwood Avenue, Toledo, Ohio

WHY THEY BUY STANDARD FRAME PARTS

Buyers of all kinds of material prefer to transact business with well established concerns. This fact is true of individual consumers, as well as of quantity consumers.

Little do you care what a salesman says about quality, service or price, if the company making the product has no reputation for these things.

The Standard Welding Company stands pre-eminent in the motorcycle industry. Our proof of this statement is this fact:

That from May 1st, 1912, to June 30th, 1912, we received specifications equaling 83.9% of our total 1911 business. These specifications cover rims, pulley rims, mud guards, forksides, rear forks, rear stays, loop tubes, handle bars, seat posts, exhaust tubes and straight lengths of tubing. The buyers of this material include manufacturers who will produce from May 1st, 1912, to April 30th, 1913, 100 to 25000 machines each.

A company that can individually transform this tremendous amount of raw material into the finished product is the type of organization that you, whether manufacturer, jobber, dealer or rider, want to deal with.

The high reputation of the American-made motorcycle of today is due largely to the excellence of our material. Foreign manufacturers acknowledge American machines to be the strongest made. While we do not attempt to claim the whole compliment, we do claim, as manufacturers of over 75% of all frame tubing, rims and mud guards, that the pride which you are justified to have in your machines is due largely to the perfection of

*"Standard" rims, "Standard" mud guards,
"Standard" tubing. Standard Welding
products represent the "Utmost in Utility."*

1913 Schickel 1913 Schickel 1913 Schickel

WHAT DAILY USAGE PROVED TO SCHICKEL OWNERS

Riding day in and day out for several months under widely varying conditions of road and climate is a fair test for any machine. Put this machine in the hands of the average owner (not a mechanic) and the test becomes more severe. But suppose the machine is entirely foreign to the owner, he has never operated a similar machine and is without even printed instructions—the test becomes the most severe possible.

The vast majority of Schickel owners never received even printed instructions, they had never operated a similar machine—but they rode every day, day in and day out. Such service proved to Schickel owners that Schickel Construction was fundamentally right. We receive daily unsolicited testimonials from Schickel owners who are more than fully satisfied—they are enthusiastic about their mounts. They are glad and eager to recommend the Schickel to interested prospects. Such loyalty is particularly gratifying to this company and stands as a substantial tribute to the success of our endeavor, which from the first has been to build a quality machine for daily service.

1913 REFINEMENTS

At the factory a record of each machine is carefully kept. Should a replacement be necessary the proper entry is made on the machine record sheet. We consulted with each of our dealers and got his opinion of the 1912 Schickel. On the data thus collected we based our plans for changes in the 1913 model. All of the well known exclusive Schickel features are retained in the new machines. By a small change in the cylinder passages and ports more power and a quicker get away is secured. A long muffler tail pipe produces a noiseless exhaust. A spring seat post of original design adds to the exceptional smooth riding of the 1913 Schickel. It is noiseless in its operation and extremely simple in construction. The appearance of the spring seat post does not detract from the beautiful lines of the Schickel.

To meet the demand of those riders who require a high powered mount, we are bringing out the Schickel Big Six.

A description in detail, including refinements in the new models appears elsewhere in this issue.

The Schickel Big Six (Right Sideview)

The Schickel Big Six

Handles as easy as a light four—Hauls like a high-powered Twin—Without the disadvantages of either

The Schickel Big Six embodies a splendid combination of power and comfort. Embracing as it does all of the previous year's proven features of the smaller Schickel, riders who want plenty of power without sacrificing comfort or ease of control will find complete satisfaction in the ownership of the Schickel Big Six.

SPECIFICATIONS

Excepting the motor, the specifications for both the five-horsepower model and the Big Six are identical.

(See previous page)

Our Message To Dealers

There will be a few cheap motorcycles sold the coming season but only a very few. Serious thinking dealers have done with cheap trade. The profit is small and the worry great. When the price of a machine runs much above the average the dealer must be willing to cut down his prospect list to a chosen few. The Schickel is not a cheap machine nor is the price beyond the pocket of many prospects. The dealer who handles the Schickel talks quality first and price afterwards. His business is his pleasure—he deals with first-class trade, makes a fair profit on each machine sold and has a live prospect list—because quality is in the Schickel motorcycle and the price appeals to a large field of buyers.

Are you interested in securing a quality line that sells at a reasonable price?

We can make a good proposition to live dealers. Applications invited.

The Schickel Motor Company, 59 Garden Street, Stamford, Conn.

Dealer and Rider Alike Have Abounding Faith in the Henderson

The 1913 Henderson, 8 H. P., 4-cylinders, \$325
 free engine, chain drive

Schebler Carbureter, Bosch Magneto, 60-degree range, 3-inch Tires, External Band Brake

In its first year The Henderson made a permanent place for itself in the regard of motorcycle dealers and buyers alike.

Its power—increased for 1913—its flexibility, its comfort, its positive chain drive, made possible only through the use of four cylinders—its silence, the absence of vibration and its smooth

riding, were new features in the motorcycle.

They have proved themselves worthy of the confidence the Henderson engendered on its first appearance.

And this confidence has spread; it has become almost a cash asset for the dealer handling the Henderson.

Are you one of them?

HENDERSON MOTORCYCLE COMPANY, 1158 Cass Avenue, DETROIT, MICH.

DAYTON

1913 WILL YOU SPEND OR INVEST IT?

As a Motorcycle Dealer you will employ 1913 in one of two ways:

ONE WAY—You will **spend** your days (and nights) trying to induce the motorcycle buyer to purchase a machine he doesn't want—one that doesn't appeal to his tastes or satisfy his needs. You will work long and hard and **Spend 1913 for Slim Returns.**

OR

ANOTHER WAY—You will **invest** 1913 offering the motorcycle buyer the machine that meets his every need—the machine he feels was built for him—in short, the motorcycle he wants. Your **Investment** will yield a **Handsome Profit.** That is The Dayton Way—

DECISIVE ACTION NECESSARY

If you want to **Invest 1913** and **Get Returns** write us and return mail will bring our 1913 Catalog and full particulars.

Have You Had Trouble With Your Tires?

A very large percentage of all punctures and blow-outs occur from improper tire inflation.

WOULD YOU PAY \$1.00 TO OVERCOME

delays, difficulties and expense resulting from these misfortunes?

Schrader Universal Tire Pressure Gauge

(Made under patent dated March 1, 1898.)

Accurately registers at all times the exact air pressure in tires.

Simply hold gauge to tire valve for a second and recording sleeve will indicate air pressure and remain fixed until pushed back into place by the finger.

Carried easily in vest or change pocket, being only 2½" long. So simply constructed as to almost never become out of order, and if it does go wrong it will immediately tell by the action of the indicating sleeve that it needs repairs. Leather case comes with it.

PRICE \$1.00 EACH

Guaranteed Simple and Absolutely Accurate

Can be obtained from all tire manufacturers, jobbers and dealers, or

PLANS FOR F. A. M. AND TRADE MEETINGS

Special Session of Federation Directors Proposed for Show Week to Consider Several Important Matters.

SEVERAL of the directors of the F. A. M. have requested President Patterson to issue a call for a special meeting of the Board to be held in New York during the week of the Show. It is probable that the session will be called to order in the office of the Chairman of the Legal Action Committee at 51 Chambers street on Wednesday, January 15, at 9 o'clock in the morning. It was the original intention of the directors not to meet until the week of the Chicago Show, but since the St. Louis meeting in November a number of matters which require immediate attention have come before the Board.

The directors are now voting by mail on a proposal to send one of their members either to the coast or on a general tour of some thirty-five States to preach the gospel of the organization, to explain its workings, to help organize the various State governments and give hearings on disputed matters. It is probable that President Patterson will announce the result of this vote in the course of a few days.

The Touring Bureau is sending out to the various directors a set of fifteen touring books, each containing twenty-five maps, the plates for which can be purchased by the organization at a comparatively low price. The Bureau is also in touch with the American Automobile Association with a view to making special arrangements to furnish the latter's maps to F. A. M. members at discount rates. The Board will be asked to determine which of the several touring propositions to accept, with a view to permitting the Touring Bureau to be in position to give members satisfactory service as soon as the riding season opens.

Members of the Board have requested the New York meeting because of their wish to bring about immediately a better understanding between the president, secretary-treasurer and chairman of the Competition Committee. The directors are of the opinion that the organization has been handi-

capped to a certain extent by the disposition of some of its officers to rush into print, instead of trying to settle their private differences of opinion in a more sensible way. It is only natural that on controverted questions the officers of any organization should now and then hold contrary views. It has been the experience of the Board, however, that problems which seem almost unsolvable through correspondence are easily disposed of when the directors meet man to man. As a matter of fact, none of these questions are of vital importance, although their exaggeration has undoubtedly created a mistaken impression in some quarters.

The New York meeting will be well attended, as the correspondence of the directors shows that they are desirous of clearing the boards for a record-breaking New Year.

FREIGHT RATE HEARING.

IT is announced that the case of the Motorcycle Manufacturers' Association vs. the Baltimore & Ohio Railway Company, et al., has been set down for argument at the office of the Interstate Commerce Commission in Washington, D. C., at 10.30 a. m. on January 8. Arrangements have been made to have the motorcycle manufacturers suitably represented, and there are indications that the long-delayed decision on motorcycle freight rates will be forthcoming, and that it will be distinctly favorable to the complainants.

NEW DIRECTOR NAMED.

AT a special meeting of the stockholders of the California Motorcycle Company, held in Los Angeles, Monday, December 2, E. J. Spaulding retired from the Board of Directors of the company and Barton Brown was appointed to succeed him.

MOTORCYCLIST'S SUDDEN END

J. M. McGRANAHAN, known as the champion motorcyclist of Oklahoma, died December 12 at a hospital in Oklahoma City, following an accident. While speeding on his machine at a rate of more than 60 miles an hour he suddenly encountered an automobile coming from a cross street and, in order to avoid a collision, turned into a ditch.

Busy Meetings Will Feature Show Week in New York and Trade Boosters Will Enjoy Luncheon.

THAT show week in New York City will not have to draw all its interest from the fine array of machines and accessories in the big exhibit, is evident from recent reports concerning meetings for which arrangements have been made. In addition to the midwinter session of the Motorcycle Manufacturers' Association, which is scheduled for the Hotel Breslin, January 15, the annual meeting of the Cycle Parts & Accessories Association will be held at the Hotel Astor, on January 16, at 10 a. m. The National Association of Cycle Jobbers, organized to replace the old association which was dissolved about a year ago, will also hold a meeting at the Hotel Astor, coincident with the Cycle Parts & Accessories session.

Following the meetings the Cycle Parts & Accessories Association will tender a luncheon at the Astor to the Motorcycle Manufacturers' Association and the bicycle manufacturers, and to the representatives of the National Association of Jobbers. Arrangements for the luncheon are being made by a committee composed of Vice-president David B. Smith, Treasurer W. J. Surre and DeWitt W. Page, and it goes without saying that the program will meet all expectations.

The election of officers for the year will be one of the features of the Cycle Parts & Accessories meeting. The officials at present directing the destinies of the association are as follows: President, L. M. Wainwright (Diamond Chain & Mfg. Co.); vice-president, David B. Smith (The Standard Co.); treasurer, W. J. Surre (Continental Rubber Works); secretary, Louis Schwab (Stevens & Co.).

NEW WINONA STAFF.

AT the December meeting of the Winona (Minn.) Motorcycle Club the following officers were elected: R. E. Haesly, president; E. Buchholz, treasurer; Harry Allen, secretary; and George Nelson, road captain.

"BIG SIX" IS SCHICKEL FEATURE FOR 1913

Four Models Are Now Offered in Attractive Two-Stroke Line—The "Big Six" With Belt or Chain Drive, and the "Five" With the Same Transmission Options; Spring Seat-Post of Novel Design, New Compression Release and Other Improvements.

FOUR models of Schickel motorcycles will be produced for 1913, the chief being the new "Big Six," a single-cylinder type having a bore of four inches. The models are: 5 h. belt drive, 5 h. chain drive, 6 h. belt drive and 6 h. chain drive. The 5 h. motors are like the 1912 model of this product, save in a few minor details. Thus there are plugs fitted in the sides of the cylinder over the inlet passage, while the compression release device is also slightly changed, as will be described below. All models are fitted with the company's valveless, two-stroke motor.

The "Big Six" motor resembles the smaller type in the shape of its cylinder, radiating flanges, etc., but the passages for inlet transfer and exhaust are differently arranged. The carbureter is fitted at the rear of the cylinder and the inlet passage is on the left of the center line, turning toward the right before passing below the exhaust passage. The transfer passage comes upward alongside the inlet passage on the right, while the exhaust outlet is at the front, the elbow being at the right and the first portion of the exhaust pipe leading downward and then passing under the magneto casing. The compression release valve and spark plug are situated at the front and rear of the cylinder, respectively, as in previous construction.

Puddle Carbureter Fitted

The compression release valve is fitted with a hood having two ports, one at the top and the other at the bottom. These ports are for the escape of the gases, and each is formed in a short cylinder projecting inward. This arrangement traps any oil that escapes and collects it within the body of the hood, from which it can be drained off through a plug fitted at the bottom. The gases escape through the ports, and the oil is not spattered over the carbureter when the latter is mounted in

front, as on the 5 h. models. The Bowden control sheath and cable pass through the axis of the hood as in 1912 Schickel construction. Both the Six and the Five motors are mounted on ball-bearings, and have the typical Schickel single flywheel and extension-casing housing the magneto. The carbureter used for the coming season is of the puddle type, gasoline being fed from the float chamber to a shallow puddle at the bottom of the mixing chamber, from which it is combined with the primary air to form the explosive vapor. To this puddle there is fitted an overflow con-

Spring Seat Details.

nection alongside of the fuel passage from the float chamber, and a pipe at the lower end carries off the surplus gasoline below the base of the motor. On the 5 h. models, with the carbureter mounted in front of the motor, a curved shield is fitted to obviate any chance of oil splash entering the auxiliary air passage, in addition to the hood over the release valve.

Ignition in all models is by high-tension magneto, the sparking point being controlled by rocking the magnetic field in relation to the motor. The spark is thus passed always at the point of maximum efficiency no matter what the speed. This has been a feature of Schickel construction since the first motor was turned out in 1907. To the muffler is fitted

a tail-pipe whose end is twisted at right angles and flattened, giving a silent but powerful exhaust.

Spring Seat Post.

Transmission is by $1\frac{3}{4}$ -inch flat belt on the belt models and by $\frac{5}{8}$ -inch pitch roller chains, a double chain, countershaft drive being used. On the countershaft is fitted an Eclipse countershaft-type clutch, which is controlled by the left grip on the handlebar. On the belt models this same grip operates the idler, and the motor pulley with cork inserts is continued for 1913, it having been found thoroughly successful. All models are equipped with the Corbin band brake, operated by back-peddaling.

The same frame is used for all models, but compared to the 1912 product there will be a number of changes. A spring seat post is fitted, the springs being carried in the hollow seat tube. A hollow plunger carries the saddle at its upper end, and there are slots formed in opposite sides through which passes the pin carrying the ends of the rear stays at its outer ends. The upper end of this plunger is provided with a second pin, and between this and the other pin is fitted the buffer spring to check the rebound. Below the main pin is fitted the recoil spring, which is kept in position by a plug in the end of the plunger. Below the plunger itself, in the seat tube is fitted the shock spring. A linkage consisting of a pair of flat members on each side is anchored to the saddle frame and main pin at its ends respectively, and the members pivot on a common axis at the rear. There is a through-pin forming the axis, with a spring to prevent side-sway and a shock-absorbing device is fitted to the left side joint. The springing device makes it impossible to "bottom."

Other Improvements.

The front fork construction is unchanged in principle, but rubber buffers are fitted on

Magneto Side of Schickel "Big Six" Model for 1913.

View of Schickel "Big Six" from Transmission Side.

the wheel axle extension to prevent striking of the rockers. The rear forks, crank-hanger and seat post are in one piece with the tank-frame when assembled, as has characterized this construction in the previous model. The rear mudguard is hinged, but fingers are fitted to both the stationary and flap portions, these fingers fitting on the under sides and bracing the joint when the guard is in position. The rear brace fits in a slot formed by the stand-latch extension, this brace being lifted to release the hinged flap of the guard. The latch retains the stand in a forward-facing notch so that the stand keeps the end of the guard toward the wheel, preventing rattle, etc. The stand is fitted with springs and automatically rises into the latch when not in use. A simple motion of the foot releases the stand from the latch and the rider need not use his hands to lower it. The mudguards are finished in black, as is the exhaust pipe and muffler, the color on the latter being permanent in spite of the heat from the exhaust.

The wheels are 28 inches, front and rear, with 2 3/4-inch Goodyear studded-tread tires.

The wheelbase is 57 inches and the speed range from five to fifty miles per hour. The control is that decided on as distinctive of these machines: grips for the free engine and throttle, lift lever for the compression release and horizontal lever for the spark. The tank capacity is three gallons, and the induction oil-

ing system is used, oil being mixed with the gasoline in the tank. The standard saddle is the Troxel and the color scheme is Schickel gray with black enamel mudguards, lettering, and muffler and tail-pipe.

Oil Shield on Carbureter.

The "Big Six" models are especially adapted for sidecar service or where a more powerful motor than the Five is desired for solo work.

MERZ A WINNER

IN the Thanksgiving Day "turkey run," held at Indianapolis by the Indianapolis Motorcycle Club, over a road course 65 miles long, John Merz, riding an Excelsior DeLuxe twin-cylinder machine, finished first, with Otto Sommers, on a DeLuxe single, finishing first in the class for singles, and third against the entire field. Both these machines were equipped with the well-known DeLuxe motorcycle motors.

Erwin G. Baker finished second, on an Indian. Mr. Merz' winning time was 1 hour 24 minutes 28 seconds, which beats the old record by 18 minutes and 32 seconds.

E. F. PERKINS is president of the Wilmington (Del.) M. C., William R. Jacobs, secretary, and A. E. McDaniel, treasurer.

PLUGGED SNOWY ROADS.

FIFTEEN members of the Salt Lake City M. C. recently made a Sunday run to Big Cotton Wood canyon, ploughing their way over the snow-covered roads. A special meeting of the club has been called to discuss the matter of affiliating with the F. A. M.

NEW COMMISSIONERS.

RECENT F. A. M. commissioner appointments are as follows: C. T. Wells, Wichita, Kan.; Hugh Scanlan, Bradley, South Dakota; L. O. Redmond, Lindsay, Cal.; Amos Meginness, San Juan Bautista, Cal.; Tony Perry, San Pablo, Cal.; Howard R. Hunter, Walnut, Cal.

FOUR DOCTORS ON LIST

FOUR physicians are included in the membership list of the Allegheny M. C., of Pittsburgh, Pa. They are: Drs. H. L. Baker, Fred Wetzel, James Witherspoon and C. C. Boyd. "In other words," writes the club secretary, "we are prepared for almost any kind of an emergency."

SECRETARY GIBSON reports the affiliation of the Blue Island M. C., of Blue Island, Ill., and the Anderson M. C., of Anderson, Ind.

Compression Release Valve.

Locking Feature of Schickel Mudguard.

The 1913 M.M.S.

New Models Show Improved Cylinders, Pistons and Rings, More Liberal Reinforcing in Frame and Forks, Strengthened Handlebars and Other Desirable Refinements.

HAVING given the finishing touches to the models which make up its M. M. line for 1913, the American Motor Company, of Brockton, Mass., is now making a complete announcement of the specifications, supplementary to the partial descriptions of the machines which were published in October. The models will rate at 8 and 4½ h., the twin listing at \$240 and the single—known as the "Four-fifty" model—selling at \$200. Both are equipped with enclosed magneto and free engine clutch without extra charge. The twin, with its sturdy 90-degree motor, is intended for heavy service in mountainous country, for extended touring and for sidecar work. It is also an ideal machine for tandem riding. The "Four-fifty," as might be inferred, is designed for lighter service, but it is still capable of giving a good account of itself on hills and in heavy going.

There are several notable improvements in M. M. motors for 1913. The metal used for the cylinder, piston and rings is a new vanadium alloy of close-grain gray iron, which combines hardness, toughness and elasticity. It is capable of taking a glass polish, which is a material aid in resisting wear. The cylinders are cast with the flanges on in order to obtain the benefit of the tough outer scale, and the scale also remains on the inner surface of the rings and piston.

An improved process has been devised for

machining these parts, and when finished each piston and cylinder is of absolutely uniform thickness. Each piston is perfectly round—which, strange as it may seem, is not always the case—and allowance is made for less than a quarter of an ounce of variation in the weight of pistons. The gauges used in measuring the 1913 M. M. pistons and cylinders permit of a variation in diameter of only one-quarter of 1/1000 of an inch. The piston rings are cast, machined and ground separately, thus insuring a thoroughly satisfactory fit and uniform pressure in contact with the cylinder walls.

The wrist-pin in M. M. motors is hollow, and consequently light. It is ground to a fit for the holes in the piston, and is not pressed in, owing to the danger of thus forcing the piston out of round. The pin is prevented from turning by a key on both sides of one end engaging in key-ways cut in one of the piston bosses. It is kept from side motion by a cotter pin, inserted through the wrist-pin and the piston boss on the other side.

More Liberal Reinforcing

The frame tubes and joints in the new machines are reinforced more liberally than in the past, and tubing of heavier gauge has been used wherever there was the slightest sign of weakness in previous models. For example, the lower front frame tube has two D-shaped

tubes inserted throughout its entire length. The upper and lower rear frame tubes, connecting to the rear jaws, are reinforced by a piece of heavy round tubing being brazed into the end far enough to support the pressure of the rear brake arm and resist any tendency to break or bend.

The idler and clutch quadrants are attached to the truss frame bar instead of to the tank as heretofore, this construction being much firmer and also obviating noise from the vibration of the idler pulley, which was sometimes annoying with the quadrant on the tank.

Unusually heavy tubing is used for the stem of the fork in the new models, the wall being nearly ¼ inch thick. The bearing of the tube in the fork crown has also been increased and heavier gauge tubing is being used in the fork frame. A new drop forging is now being used for the side plate extensions at the axle. The spring leaves for 1913 are made of chrome silicon vanadium spring steel, a new alloy. The uprights rising from the front axle are of new design; either side can be replaced independently in case of an accident.

Greater Strength Provided

The fork tip forgings at the lower ends of the fork frame have been increased in thickness, with heavier lugs running up into the four fork-frame tubes. The stand on the 1913 models is made of stiffer metal, and the stand latch is of tempered spring steel, guaranteed to retain its shape. The handlebars have been slightly changed for the coming season, being a little wider, with grips flaring outward. The bar is keyed to the handlebar clamp with a thick washer around the reinforcement, thus making it impossible for the handlebars to force down under long pressure. The grip controls have also been improved and the leverage has been increased in the exhaust lift grip, thus facilitating operation.

All rod ends have been made heavier, thus giving more wearing surface at these joints. Lock washers are used with the nuts on all grip control parts. The original roller bearing construction used on the twin crank-pin bearing, and the "Four-fifty" motor for the 1912 models have proved its effectiveness, but refinements are noted for the coming year. Bosch armored magnetos and improved New Departure brakes are standard equipment.

Other Improvements

Among other refinements is a new gasoline and oil pipe connection which is attached to the pipe without solder; it remains perfectly tight and permits of using the full capacity of the pipe.

For 1913 the M. M. machines will be finished in an attractive shade of French gray. The cylinders, magneto and saddle springs are black and there is a black decorative panel on either side of the tank.

New Piston Rings and Wrist-pin Used in the Improved 1913 M. M. Motor.

On account of the greater length of the handlebars and the greater weight of the twin model, a cross-bar reinforcement has been inserted. This provides additional strength and also adds to the convenience of attaching a gas tank, lamp, horn, speedometer or other fitment.

A new fitting is used in the center of the intake manifold which gives a wide elbow and easy turns, thus providing for easier access of the gas from the carburetor to the cylinders. The twin is also fitted with a larger manifold and a 1-inch carburetor instead of a ¾-inch type as used heretofore. This cuts

Reinforced Handlebars, and Reinforced Frame and Fork-stem Tubing.

down the amount of gas required to fill the cylinders at high speed by nearly 50 per cent. and adds to the speed of this model.

A Muffler of New Design

The muffler and exhaust pipes have also received attention. The latter are given a more gradual curve and are kept out from the motor base to permit of better circulation of air than was possible in the past. The new muffler, while smaller in diameter and proportionately neater in appearance, is credited with being as effective as the old silencer.

A brand of steel known in mechanical circles as "high-ten" is now used in the eccentric magneto gears. It is unusually tough and still can be tempered to resist wearing of the teeth, which undergo a severe strain due to the eccentric principle. One of the improvements noted on the "Four-fifty" model is a large tool-box, capable of carrying an inner tube and batteries for lighting, if desired.

The 1912 features which are found in the new models without change are the 90-degree principle used in the twin motor, the separate cam-shaft compartment in the base, the double truss forks, the multiple disc free engine clutch, the turn-buckle chain adjustment, the spring-tension hand idler and the long, non-grain bronze bearings.

General Specifications

Transmission is by V-belt or endless flat leather belt (Spartan) 1¾ inches wide, on the twin, and by 1¾ inches endless flat belt of Spartan make on the single. Force feed lubrication is used; the Eclipse clutch is standard

equipment, as is the Schebler carburetor, and a choice is allowed of Mesinger Standard or Cavalry saddles. Tires are 2½ inches wide, with options on the leading makes. Gasoline tank holds seven quarts, oil tank three pints. Twenty-eight-inch wheels are fitted. Height to seat-post, 29 inches.

AN ADJUNCT TO THE CHURCH.

OUT in Kansas where the towns are small and the distance between towns just the opposite, there are several up-to-date ministers of the Gospel who are enthusiastic motorcyclists. They find that it enables them to do their work much more effectively out in the country; and it gives them, besides, a chance to secure some of the recreation that they need.

Rev. J. F. Steves, of Admire, Kansas, is one of the men, and he has been a Yale rider since 1909. Besides his charge at Admire, Mr. Steves preaches at another country church. Before he enlisted the Yale in the good work it meant a long, tiresome journey of several hours whenever he preached at both places on the same Sunday. Now it's merely a ride of an hour.

A CORRECTED LIST.

AN error found its way into a recent announcement of the officers of the Pittsburgh M. C. and Secretary W. J. Black has forwarded the following corrected list: S. J. Martin, president; G. G. Powell, vice-president; W. J. Black, secretary; H. A. Neville, treasurer; G. M. Beckett, E. B. Connell and A. G. Schmidt, House and Rules Committee; S. C. Hamilton, R. E. Dennis and John Presy, Entertainment Committee; B. S. Hargrave, E. B. Connell and B. Powell, Membership Committee.

A SIDECAR CLUB.

WHAT is probably the first sidecar club on this continent was recently formed in Toronto, Canada. The city boasts of 150 machines with sidecars and practically all of the sidecar enthusiasts have joined the club.

THE motorcycle is finding its way into the repair department of practically every telephone company in the Union.

F. A. M. GROWTH BY STATES.

F. A. M. membership statistics for November are given by Secretary Gibson as follows: New Hampshire—renewal, 1; Massachusetts—affiliated, 2; unaffiliated, 1; renewals, 8; Rhode Island—renewals, 2; Connecticut—affiliated, 1; renewal, 1; New York—affiliated, 26; unaffiliated, 2; renewals, 31; New Jersey—affiliated, 16; renewals, 4; Pennsylvania—affiliated, 6; unaffiliated, 1; renewals, 13; Maryland—renewals, 10; Virginia—renewal, 1; Tennessee—renewals, 2; Georgia—unaffiliated, 1; renewals, 4; Florida—affiliated, 3; Alabama—renewals, 4; Louisiana—affiliated, 19; renewal, 1; Texas—affiliated, 7; unaffiliated, 1; renewals, 4; Kentucky—affiliated, 2; unaffiliated, 2; renewal, 1; Ohio—affiliated, 25; unaffiliated, 15; renewals, 7; Indiana—affiliated, 23; unaffiliated, 1; renewals, 4; Illinois—affiliated, 31; unaffiliated, 3; renewals, 10; Missouri—affiliated, 26; unaffiliated, 1; renewals, 13; Wisconsin—affiliated, 15; unaffiliated, 1; renewals, 6; Michigan—affiliated, 1; unaffiliated, 1; Minnesota—unaffiliated, 1; renewals, 6; North Dakota—unaffiliated, 1; renewal, 1; South Dakota—affiliated, 1; renewal, 1; Kansas—affiliated, 34; renewals, 2; Iowa—unaffiliated, 1; California—affiliated, 27; unaffiliated, 14; renewals, 25; Nevada—unaffiliated, 1; Colorado—unaffiliated, 1; renewals, 3; New Mexico—renewal, 1; Arizona—unaffiliated, 1; Montana—affiliated, 4; unaffiliated, 1; Washington—affiliated, 4; unaffiliated, 1; Philippine Islands—affiliated, 4; Cuba—unaffiliated, 1. making a total of 277 affiliated, 53 unaffiliated and 166 renewals.

MAY TRY FOR ASSEMBLY.

OFFICIALS of the Chicago Motorcycle Club are considering the advisability of launching a campaign to bring the next national assembly of the F. A. M. to the Windy City. They suggest that the national races could be held on the Elgin automobile course and that the Riverview Motordrome could also be used for professional events.

MEMBERS of the Maryland M. C., of Baltimore, participated in a run to Annapolis on Sunday, December 15.

FERGUS FALLS CARRIERS.

IN the accompanying photograph appear three R. F. D. mail carriers of Fergus Falls, Minn. From left to right they are Messrs. Tomhave, Davis and Haarstick. These men crowd their machines to the limit in covering their routes through all

kinds of weather, but they have obtained uniformly good results. On the day the picture was forwarded the thermometer showed 10 degrees below zero in Fergus Falls, but the motorcycle carriers took to the road confidently. The photograph is forwarded by O. Bertelsen & Co.

The F.A.M. Abroad

GOVERNING motorcycle bodies of nine countries, including the United States, were represented at the international conference held at Olympia, London, November 28, which resulted in the organization of the *Fédération Internationale des Clubs Motorcyclistes*. The F. A. M. had delegated William H. Wells, of London, to act as its representative, and Mr. Wells was honored in the same manner by the Canadian Motorcyclists' Association. An official report submitted by Mr. Wells indicates that the formation of the international body was attended by much enthusiasm, and that it enters upon its career under most favorable circumstances.

It was agreed that the next meeting of the body, to act upon rules and dispose of any other matters requiring attention, would be held in Paris, December 14, and as soon as this information was communicated to the F. A. M. Mr. Wells was requested by cable to act again as the representative of the American Federation. It is quite likely that Mr. Wells will be named by the F. A. M. as its vice-president in the international body, the rules stipulating that each governing body represented shall appoint a vice-president. It is known that the English enthusiast is willing to accept the office.

The List of Governing Bodies.

The countries to participate in the organization meeting were: Belgium, Canada, Denmark, England, France, Holland, Italy, Switzerland and the United States. Belgium was represented by Emile Beukelar, president of the committee L. V. D.; M. Fagard, president Motor Club Liegeois; M. Michant, secretary R. A. C. B.; Baron Northcomb, president Commission Sportive R. A. C. B.

Canada was represented by William H. Wells, and Denmark had two officials on hand—M. H. Christiansen, vice-president of the Danish M. C., and, M. Mathiasen president of the Motorcycle Club of El-lenham. The English representatives were as follows: E. M. P. Boileau, chairman of Relations Committee of the Auto-Cycle Union; T. W. Loughborough, secretary of Auto-Cycle Union; Meyrick Jones, of the General Committee of the Auto-Cycle Union, and G. F. Sharp, vice-president of the Auto-Cycle Union.

France had two delegates—M. Longue-mare, of the Commission Sportif, A. C., de

France, and T. G. Fenton, of the same body. R. R. Lear, president of the N. M. V., acted for Holland, and Italy was represented by M. le Doctor Oreste Togni, president du Moto Club d'Italia. M. Neher, president of the S. M. T. C., was the Swiss delegate, and William H. Wells acted for the F. A. M. as the governing body for the United States.

Officers of the international federation were elected as follows: The Hon. Arthur Stanley, M.P., was unanimously chosen as president for the opening term; George F. Sharp, of the Temple Press (*Motorcycling*), was elected treasurer, and T. W. Loughborough, secretary of the Auto-Cycle Union, was chosen as secretary.

Objects of the Federation.

The prime objects of the *Fédération Internationale des Clubs Motorcyclistes* is to bring about co-operation among national motorcycling bodies, to foster the sport of motorcycling, to encourage international touring, to provide a central bureau of information on all matters relating to motorcycles and to organize congresses and international competitions for motorcycles. The draft rules printed below were submitted to the assembly and briefly discussed; it was expected that they would be adopted with few revisions at the Paris meeting on December 14. Following the business session of the delegates they were entertained at a luncheon by the Royal Automobile Club.

Original Draft of Rules.

The following rules are interesting as giving an insight into the aims and general policy of the federation, as well as into its executive regulations:

Title.—The title of this body, founded in

Paris on December 22, 1904, and re-established in London on November 28, 1912, shall be the "*Fédération Internationale des Clubs Motorcyclistes*."

The Federation shall be a *Société Anonyme*, and the liability of each Club shall be limited to its subscription.

Representation.—Each country is eligible for representation on the Federation by not more than one Association or Club, which shall be the body controlling the sport in that country. In the event of there being no recognized controlling body for sport accepted by the Automobile Club of the country in question, the existing associations may nominate a delegate, whose appointment shall be subject to the approval of the Automobile Club of the country, and he must submit to the Federation the papers necessary to establish this approval.

Objects.—Its objects shall be: To secure and maintain mutual co-operation amongst the national bodies controlling, in their respective countries, the sport of motorcycling. To encourage and foster the pastime of motorcycling. To facilitate international touring, and maintain cordial relations between the national associations. To provide a center of information on all matters relating to motorcycles. To organize Congresses, and International Competitions for motorcycles.

Headquarters.—The headquarters of the Federation shall be as may be determined annually.

Limitation.—For the purposes of these Rules, a motorcycle body shall be: One whose members comprise the users of motorcycles; motorcycles with sidecars and cyclecars.

Freedom of Individual Action.—The Federation shall not interfere with the independence of any constituent association in the conduct of its national affairs.

International Agreement.—All questions relating to reciprocal membership or the interchange of services are left to private treaties of alliance, which each of the constituent associations retains power to contract independently of the Federation, with any other constituent or non-constituent association.

Membership.—Associations desiring to be received into the association shall make application to the Central Bureau before the 1st of

October for membership during the succeeding year. An inquiry shall be made by the Central Bureau, and the information obtained, whether favorable or unfavorable, communicated as received, to those associations already members, one month before the opening of the Congress. Only those associations which are represented at the Congress shall be entitled to vote with regard to the admission of new associations, such admission to take place by a majority of three-fourths of the vote.

Congress.—A. The Federation shall hold a Congress at least twice a year, the first to be in December, and the second about June in the city decided upon by the Congress at its previous meeting.

B. Notices of the Congress, together with the Agenda paper of all matters to be discussed or voted upon, shall be sent by the Secretary of the Federation to the Delegate and Secretary of each representative body at least one month before the day of the meeting, after approval by the Secretary of the date and hour chosen.

Composition of the Congress.—Each constituent association shall be represented at the Congress by one or more delegates, of whom one alone shall have the right of vote. The name of this voting delegate shall be announced at the commencement of the Congress.

In his unavoidable absence he may, with the consent of the Congress, appoint a substitute to vote from the other delegates of the Club. No country can obtain a vote unless its delegate or his nominee is present in person when the vote is taken.

Credentials of Delegates.—Each delegate shall, prior to the Meeting of the Congress, hand to the president or his deputy, a letter from the Association or Club whom he represents, stating that he is empowered by such Association or Club to vote on their behalf, and that they are willing to abide by and be responsible for his actions.

No decision of the Congress shall be valid unless at least half of the constituent associations be represented. For all decisions of the Congress, save only those exceptions which are specified in these rules, a bare majority of votes shall be sufficient.

Quorum.—At least one half of the countries represented in the Federation is necessary for the validity of its deliberations or decisions.

Central Bureau.—In the intervals between the sittings of the Congress, the work of the Federation shall be carried on by a Central Bureau. This Bureau shall consist of a President, three Vice-Presidents, a General Secretary and a Treasurer. It shall have full administrative power, and may act as scrutineers in the ballot in the event of any votes being taken by post.

Election of Officers.—The election of officers, who shall constitute the Central Bureau, shall be by means of a ballot, and shall take place at the December Congress in each year.

Postal Votes.—A vote by correspondence may be taken in the following manner. The motion must be sent in to the President of the Central Bureau. Within the term of a month after its receipt, it must be sent out accompanied by a voting form to all the constituent associations which shall return their votes within two months of the date of issue. The term on which this date expires must be explicitly stated on the voting form. Any Association or Club not having registered its

vote within the time indicated shall be considered as voting in the affirmative.

All correspondence shall be by registered letter post.

Subscriptions.—Each association belonging to the Federation shall pay an annual subscription of 250 francs for the twelve months ending 31st December. All subscriptions shall be paid before the end of January.

In the event of a Club's subscription not being paid by the end of January, that Club shall not participate in any of the advantages and privileges of the Federa-

tion, but its liabilities shall continue, and the Congress may refuse to accept its resignation until all arrears of indebtedness have been paid.

Resignations.—Any association or club wishing to withdraw from the Federation shall give notice of such intention to the Central Bureau by registered letter before the 1st October in any year.

Expulsion.—The expulsion of any Association cannot take place except at a Congress, and there must be a majority of at least three-fourths of the votes.

Finance.—A. All subscriptions and other monies shall be remitted to the Secretary, who will give an official receipt therefor. Any expense other than those arranged for by the Congress can only be incurred on the approval of the Clubs forming the Federation.

B. The Secretary shall periodically hand to the Treasurer all monies received by him, who shall pay same into the bank in the joint names of the President and Treasurer, and that all cheques drawn to meet current expenses shall be signed by the President and Treasurer.

Dissolution.—The Federation can only be dissolved by a majority of two-thirds of the votes of those delegates present at the Congress called for that purpose, and in the event of its being decided to dissolve the Federation, the funds in hand will be divided amongst those associations belonging to and retaining their membership in the Federation.

SPRINGFIELD, Mass., is conducting experiments in mail collecting with the motorcycle van outfit shown in the photograph. George E. Rooney has been assigned as pilot.

M. M. A. PROGRAM

PLANS have been laid by the Motorcycle Manufacturers' Association to print and distribute free of charge, 10,000 copies of a handsome program and trade directory in connection with the independent Motorcycle Show in Chicago. Besides the musical program and trade directory the booklet will contain short sketches of the men back of the various exhibits, and will be of prime interest in other ways. The Show Committee is now accepting advertising copy for this program and those who desire to be represented in it are requested to apply for rates and other details. The program will be 6

by 9 inches and will have about 48 pages and a highly attractive cover.

GIRLS SOLD RIBBONS.

WIVES and sweethearts of members of the Jose (Cal.) M. C. operated a ribbon system successfully in connection with a recent racing program arranged by the club. The girls hustled about and pinned a ribbon on the coat of a motorist wherever they found one, and then collected a nominal fee. The ribbon entitled the wearer to admission to the track and to participation in a big barbecue which followed the racing. The ribbon idea had not been applied to the motorcycle game before in California, and it is stated that a number of other clubs throughout the State may now resort to it in connection with future meets. It enables the girl enthusiasts to give the clubs practical assistance and also results in rounding up every speed fan in the district.

LECTURE BY TOURISTS.

L. H. LANE and G. H. Hammond, who recently completed a 13,000-mile trip through the British Isles, were guests of the Flower City M. C., of Rochester, N. Y., at its last meeting. The guests consented to turn entertainers for the evening and gave the members an interesting description of their tour.

CHARLES DE SALVO, widely known as a motorcycle speedster, has accepted a position as chief tester with the Black Hawk Motor Company.

THE CLUB IN OUR TOWN

Further sidelights on the upbuilding of an organization that encountered more than its share of obstacles

By FREEMAN JARGO

How a Small Squad Struggled Through Early Vicissitudes, Fought Off Trade and Other Jealousies, Grew in Membership, and Finally Came Into Possession of a True Spirit of Fellowship.—Part II.

I RECALL one incident that opened quite a breach in our club. While eight of the boys were on the road on a certain Saturday afternoon three of them figured in a rather serious mix-up. They went over an embankment into a gully about ten feet deep, and while the riders escaped injury each machine was pretty badly battered. Two of the machines were of the make that had six representatives in the club, while the other was of a rival make, represented in our ranks by only three riders. One of the former members located a telephone and informed the city agent for his make of machine of the accident.

There was some confusion, and a messenger from the city finally appeared with repair parts for the two machines of the make handled by this dealer, but without any parts for the other damaged machine. Naturally, this rider figured that he had been ignored for trade reasons, and when it came to being "sore" he had the traditional boil backed completely off the anatomical map. As a matter of fact, the dealer had not interpreted the telephone message correctly, and that accounted for his failure to have his messenger obtain repair parts for the third machine before starting for the scene of the accident. He offered this explanation, but it was accepted "on the half shell," as it were, and that little incident threatened for a time to revive all kinds of factional differences.

The Value of a Road Doctor.

The incident above referred to taught us a lesson, and we lost no time in appointing a mechanic, or "road doctor," as we called him. He was a club member who was unusually handy about a motorcycle engine, and for acting in the capacity of mechanic he was presented with a paid-up membership card for a year. It was the duty of this rider to assist the boys when they had trouble on the road, and if necessary to ride to the nearest town to obtain repair parts. Obviously, no trade lines could be drawn under these conditions, and the mechanic simply put forth his best efforts for the other members, regardless of dealers or machine makes.

It is not always easy to find a competent and reliable rider in a club, who is willing to act as "road doctor," but when it is possible the appointment should be made at once. Our club found that its rider-mechanic was worth ten times the amount of his dues for the year, and he seemed to enjoy the work, which was seldom onerous.

Assessments Breed Trouble.

Owing to the fact that the father of one of our members owned the building in which we finally obtained quarters we were able

to drive an excellent rent bargain, and our expenses in general were not heavy, but even these favorable conditions did not prevent us from having financial troubles. A furniture committee was appointed, and while its outlay seemed quite reasonable—between \$90 and \$100, I believe—it was sufficient, with the rent, lighting bills and incidentals, to give our officials many an anxious moment. The boys usually were fairly prompt with their dues, but we had no other income at that time, and finally it was decided that the members would have to submit to a furniture assessment. This was a mistake, but we did not realize it until later.

At that time our club had grown to twenty-two members, and it was explained that if each rider would make a special contribution of one dollar our committee could meet the next two payments on the furniture and in

it was time to give up the quarters, and perhaps the organization itself. Those were gloomy days.

How a Picnic Saved the Day.

Finally the assessment was reduced from one dollar to half a dollar, and the boys paid it, but not until they had expressed themselves pretty forcibly. It was quite plain that an effort to collect another assessment—however necessary it might be—would result in the disruption of the club. Accordingly, our officers set about solving the financial problem in another way, and as luck would have it they hit upon just the right scheme. Plans were laid for a picnic at a park three miles outside the city, and by handling the three dealer members diplomatically (this was left to the cool-headed officer before mentioned) we soon had them working like Trojans for the affair.

Invitations were sent all the motorcyclists we could locate in our county and to two clubs about twenty miles distant. The idea was a new one, as applied to the motorcycle field in that territory, and we had no less than forty visitors. Each paid a dollar—as did our own members—and this entitled them to all they could eat and drink, and to participation in several games for which prizes of motorcycle accessories had been donated by the three dealers. Incidentally, each dealer furnished one course of the dinner, and in a cheap but tasteful little program his name was used in connection with that course: Watermelon—a la Bill Jones, for example. This gave the dealers a sort of "comeback" for their outlay, and made them feel that we appreciated their generosity. It also introduced them to the visiting riders, and that was a point not to be overlooked. Well, the picnic was a financial success, and with all bills paid we netted about \$30. Don't smile; that thirty-dollar profit looked like a fortune to us at that time, and it probably saved the club. Here's the moral for young clubs: Never force an assessment upon the members if there is any way open to your ingenuity of raising money otherwise—and there usually is.

Dealing With the Road-Burner.

I sometimes think one of the best possible developments for clubs throughout the country would be a decision on the part of manufacturers to make no motorcycles capable of a speed greater than 25 miles an hour; under such conditions the road-burner would be eliminated and a great stride would be taken toward that sociability which is a fundamental of the thoroughly successful club. Such an arrangement is out of the question, of

"The bills continued to pile up until they gave our officials many an anxious moment."

the meantime the dues would have accumulated so that the following instalment, and possibly the one after that, could be handled without difficulty. The proposition shaped up well on paper, but when it came to collecting we struck a snag, half a dozen of them, in fact. One or two of the boys went so far as to state that if the club couldn't meet its expenses without "sandbagging" its members,

course; it is suggested simply as a basis of argument, but the fact remains that if some scheme could be devised to keep the riders together throughout an ordinary run it would dispose of another source of trouble in clubs.

Officers may lay down rules for the road, but the chap with a twin seven is going to chafe a bit and finally give up going on the club outings if he is compelled to purr along peacefully with his brother member who mounts a four. He knows he has the power under him; he has paid for it, and he wants to use it. On the other hand, the rider with a single, perhaps of last season's vintage, objects to being "shown-up" for a mollycoddle along the road. Soon the club is divided on the road into the speedsters and the conservatives, each regarding the other with more or less contempt.

This is a condition to be deeply regretted, for it is on the road that any motorcycle

honest pride in its achievements, and when he does this the organization is on the high-road to success. Not long ago one of our most dependable riders figured in a rather embarrassing mix-up, which will serve admirably to illustrate my point. He attempted to pass a hay wagon on a narrow road, with the result that he found himself in a ditch with a goodly portion of the load of hay on top of him, for the horses had shied and partly upset the wagon.

While our member was straightening a few kinks in his machine and also trying to straighten matters with the owner of the hay, two unknown motorcyclists appeared. Naturally, they stopped and made inquiries.

"I see you're a member of the——M. C.," remarked one of the strangers, pointing to the pennant which still dangled from the handlebars of the damaged machine.

"Nothing doing, objected our rider, this is my brother's machine; I merely borrowed

sacrificed himself to protect his club and maintain the standing of its emblem. There was true club spirit for you! He didn't need to tell the story, for the two visiting motorcyclists rode on into our town and explained how an unfortunate rider on the road had been fair enough to stand by our club. When the member in question arrived home with his battered machine late in the afternoon, he discovered that he had gone up in the estimation of his clubmates about fifty per cent. He found the boys slapping him on the back with a new spirit, and it was worth all he had suffered in the mix-up. See the point I'm getting at? How can a club go wrong, or fail in any legitimate aim if it has half a hundred members like the one referred to in the above incident? It can't.

True fellowship is not indicated simply by a handclasp now and then, and the willingness to supply a few timely drops of cement or a patch for a brother rider on the road.

club's enthusiasm and its spirit of sociability should be at top pitch. Our club worked around the problem to some extent by offering prizes for the members attending the most social runs, and by subtracting ten marks from the score of each rider who abandoned the squad on the road. If a member felt like speeding on ahead of the club the officials did not attempt to restrain him; they simply "docked" him ten points, and the other boys regarded him somewhat in the light of a deserter. This system helped, but the road-burners and the speeding problem we had always with us—and we still have them.

Respecting the Club Emblem.

We have learned through experience that organizers of motorcycle clubs cannot be too careful in fostering respect of the club's standing in the community and of its emblem. The rider who respects his club will take

MOTORCYCLISTS of Trenton, N. J. dining as guests of John Sykes, Indian agent in the capital city, at his second annual banquet held recently. Over fifty riders from Trenton and nearby cities were present.

it for a short run. And, say, if he knew I had disgraced his club by getting into a fool mix-up like this, he'd never let me get within shouting distance of the machine again. The members of the —— M. C. are a careful and experienced lot of boys, and they don't do things like this."

Why a Generous Spirit Pays.

With that our rider rolled up the pennant and stuck it into his pocket, to avoid further embarrassing explanations. He had been obliged to deviate from the truth, but he had

It goes deeper. It implies that you would not injure his feelings, any more than you would deliberately damage his machine or any other piece of his property. It means a willingness to speak a *good word* for him—though a disparaging word may seem handier; it means an attitude of fairness toward your dealer (who usually has troubles of his own), toward all road users, motorcyclists or otherwise, and toward the club upon which your actions reflect—for good or ill. As previously stated, our club has grown to over eighty members—it had sixty at the time of the pennant incident related above—and we feel now that our fellowship percentage is fairly high. Still we did not come by it in a day, and what we have done other clubs can do.

F. J. WILHELM Company, of 114 North Erie street, Toledo, are distributors for the Reading-Standard in northwestern Ohio.

"WITH all our manufacturers figuring on capacity outputs for 1913 and prospects exceedingly bright for the biggest year in the history of the American trade," remarked the veteran dealer who was tinkering with my cranky grip control, "it strikes me that the time is at hand for motorcycle dealers throughout the country to perk up and see that they keep pace with developments. That does not imply simply a new coat of paint on the storefront and a column or two of advertising in the local papers—although both these lines of activity are commendable; it means that the dealer must get down to bed-rock business principles, that he must not only make sales, but get some real money for making them.

"I ought to known a thing or two about the situation," continued the V. D., "for it has kept me pretty busy during the last season making up the money I allowed to get away from me in the two previous years. I don't mean that I ran far behind; if I had I probably would be working for some one now instead of running my own shop, but in one way and another I did lose considerable money and a lot of valuable time.

"Have trouble with collections?" I queried, assuming that outstanding bills must figure heavily in the losses referred to by the veteran.

"Not half as much trouble as might be expected," was the reply.

The dealer straightened from his task and tapped my shoulder portentously with a calloused forefinger.

How Profits Dribbled Away.

"Don't let that bad bill idea run away with you," he went on, "for I have found that very few of the boys will order a job done unless they can see their way clear to pay for it. The same policy is usually applied to the purchase of a machine. I have learned that when a patron comes to my shop prepared to pick out his mount he is quite likely to have two-thirds of the purchase price in his pocket. I am assuming, of course, that he is going to buy a new machine outright. If he is desirous of trading in an old mount he probably counts upon paying very little in actual cash, and I am in line for trouble.

"No," continued the dealer, "outstanding

bills have not bothered me half as much as 'instanding' machines. By the latter I mean old machines on which I have allowed \$75 to \$150 in a deal to dispose of a new model, and which I have often been compelled to sell at such a loss that my profit on the new machine dribbled away, leaving me nothing for my trouble but a broken-down motorcycle which required repairs before I could even offer it for sale.

The Trading-In Bugaboo.

"No matter how you look at it, the exchange system entails the making of two sales," said the V. D., as he returned to my machine, "and the second sale is the one that usually adds to our gray hairs. Even assuming that the original bargain was a good one, and that the used machine was taken in at a fairly low price, it is quite likely that we will be forced to sell it finally for less than we allowed the purchaser of the new mount, thus cutting into our margin on the latter.

"The solution of the exchange problem? Well, strictly speaking, I don't believe there

accompanied by their wives or sweethearts, and the feminine enthusiasts entered into the spirit of the occasion with a vim. The two accompanying photographs tell their own story. In the one at the left the girls are assisting in the demolition of the melons, while the other picture shows the male contingent hard at work, with plenty of melons still ahead of them.

ONE of the most novel and successful outings held at Redlands, Cal., during the last summer took the form of a watermelon feast engineered by C. H. Clem, Harley-Davidson agent in Redlands. Clem drew no lines in sending out his invitations, and riders from near and far gathered at the scene of the melon carnival. About a score of the guests were

is one. As long as dealers take in second-hand machines they are pretty certain to have more or less trouble. I have solved my own problem by refusing to load up with old mounts, unless their owners practically offer them as gifts. But before I arrived at this decision I had to learn my lesson.

"When a rider announces now that he wants to trade in an old machine as part payment on a new model I explain the situation to him, and wind-up by agreeing to store his second-hand mount while I am trying to sell it for him, but I insist upon getting the regular purchase price for the new machine. Then if we are left with the old mount on our hands, the rider suffers the loss, and this is as it should be. He has had a season or two of service out of the machine, and even if the broken-down mount is never sold the owner has not lost much. On the other hand, if I fail to sell a traded in machine it is a clear loss to me.

The Manufacturer's Attitude.

"In spite of all our figuring," lamented the veteran, "there may come a time when the

manufacturer of the machine or machines we represent decides to cover our territory from a centrally located branch, and we are left high and dry, after years of struggling to make ends meet. I have not had to contend with such conditions of course, but I know of motorcycle dealers who have. There is a reason for the action of the manufacturer, he cannot be blamed for running his sales organization as economically as possible, but it does seem pretty tough on a dealer.

"The latter, particularly if he is in a small district, is held directly responsible for the performances of the machines he sells; he introduces a certain make and stands behind the guarantee to keep it running. He must doctor the mount from time to time, so that when the rider decides to buy a new machine, he will not purchase one of a rival make, and much thought and some material go into the mount, without a direct return from the dealer. He is laboring to uphold the manufacturer's reputation as well as his own. True enough, the manufacturer has the cash and assumes the main responsibility, but the

dealer puts his mechanical skill and his integrity into the business, and if he fails in this the manufacturer soon finds that the district is producing no sales.

Justice for the Small Dealer.

"However small the dealer's business may be, I do not believe he should be deprived of his agency with a sharp turn if he has been doing his best and playing fair with the manufacturer," asserted the veteran, "but here enters another problem. The dealer may be doing his best and still not producing half as many sales as an agency in a better location might turn in; is the manufacturer to sacrifice these sales and allow the small dealer to retain the agency simply because of the fact that he introduced the machine in that territory? You see, there are two sides, as usual, and I would prefer to have some other dealer act as judge in the premises. Conditions do not appear to be just what they should be, but in which direction shall we travel to improve them? How are we to give full justice to the small dealer and still play fair with the manufacturer?

CARRIED TON OF MAIL.

THREE rural mail carriers of Haven, Kan., who use motorcycles in covering their routes have compiled figures showing that in one month's time they handled a ton of mail matter on their routes. The total number of pieces carried was 20,710. They complete their day's deliveries in about two hours on motorcycles, while it used to take them nearly all day with horses. The present expense for a trip is 10 cents, whereas \$1 was the usual expenditure with the horse system.

CLUB WORKER KILLED

WHILE crossing a railroad track, Clayton T. Robbins, Yale and Indian agent at Elyria, Ohio, was struck by an engine and killed. With his death the Elyria Motorcycle Club loses one of its most active members and boosters. Fifteen members of the Elyria M. C. acted as pallbearers at the funeral.

A REPORT from the marshal's office shows that more than one hundred motorcycles were sold in Springfield, Ohio, during the past year.

REGISTERED SHOPS.

THE motorcycle repair shops of George O. Murphy, 89 Main street, Waverly, R. I.; Thomas J. Newman, 2718 Atlantic City, N. J.; Habich Brothers (Charles Habich), 170 Western avenue, Blue Island, Ill.; Richard E. Morrison, 108 South Broad street, Middletown, O., and A. R. Horn, of 716 Third avenue, South, Minneapolis, Minn., are now on the F. A. M. registered list.

WHERE SALES ARE RAPID.

STATISTICS gathered by the Marshal of Redlands, Cal., show that more motorcycles are purchased in Redlands than in any other town in the country of its size. During the last year seventy-five machines of one make alone were sold in that city.

A NOTABLE RECORD.

ALTHOUGH the motorcycle has been in use by the police department of Fulton County, Ga., only two years, Z. E. Rowman, chief of police, claims that crime and disorder have been reduced 50 per cent.

BANQUET IN SHOW WEEK

AT the last meeting of the Cleveland (Ohio) M. C. plans were laid for an endurance run, not to exceed 100 miles. It will be held on January 1, and entries are being filed rapidly. The club also decided to hold a banquet on Wednesday, January 8, as a feature of the Show Week. A banquet held last year under the same conditions scored a hit. The club is now holding its meetings in the Hotel Gillsey.

C. M. A. BANQUET

AN unusually attractive program marked the first annual banquet of the Canadian Motorcyclists' Association, which was held at the St. Charles Hotel, in Toronto, on Friday, December 20. A fine spread was followed by addresses and entertainment features, and the whole affair reflected credit upon the committee in charge and upon Canada's recently formed governing body for motorcyclists.

SPOKANE EXACTS FEE.

A NEW motor vehicle law, which has just gone into effect in Spokane, Wash., requires motorcycles to carry a license, for which a fee of \$2 will be charged.

MAPPING FOR MOTORCYCLISTS

F. A. M. Touring Bureau's First Official List of Routes About Ready for Distribution; Timely Suggestions by Official of Automobile Touring Bureau Relative to Developing a New Department for F. A. M. Riders.

OFFICIAL announcement is made that the F. A. M. Touring Bureau is now in possession of information covering nearly 400 routes throughout the country, and it is stated that most of this data will have been tabulated and filed before the middle of January. An official list of these tours has been forwarded to National Secretary G. B. Gibson, who will distribute printed copies with other Federation literature after the first of the year. It will then be a simple matter for any F. A. M. member to make application for a listed route. Supplements to this list will be prepared and distributed from time to time as the Touring Bureau completes its information on additional routes.

A Timely Interview.

Not long ago an official who has been identified for years past with an automobile touring service of national scope found time to lean back in his swivel chair, light a cigar and discuss the possibilities of road-mapping for motorcyclists with a representative of the F. A. M. Touring Bureau, and as a result those in charge of the latter department have been still further impressed with the responsibilities that devolve upon them and with the opportunities at hand for progress.

"While I have not been called upon to make the closest study of motorcycle touring conditions," said the automobile official, "I have kept in touch with the performances of tourists on the single-trackers of late and have arrived at the conclusion that many skeptical folk are due to be startled by the extent to which motorcycles will figure in national touring during 1913. Consider the situation for a moment. The standard motorcycle will travel wherever the automobile has gone, and in many places where the latter's four wheels bar it; admitting this, it is obvious that touring must become the most powerful factor in spreading motorcycle popularity.

The Demand for Special Maps.

"Bicycle boosters of a few years ago made great strides in touring work, but in view of the fact that bicycle touring was necessarily quite narrow in scope it never did and, of course, never could assume the relative importance of motorcycle touring. The motorcycle is naturally a long-distance traveler, and special provisions must be made for its devotees. In the first place good maps are necessary, and it is far from an easy task to obtain them. An ordinary road map will serve the purpose, of course,

but if motorcycle tourists are to be given proper encouragement they should have maps prepared with consideration for their particular requirements.

"The large and rather heavy route books arranged for automobilists are unsuitable for motorcyclists, and it strikes me that the present problem of the F. A. M. Touring Bureau is to provide sectional and State maps in the simplest possible form, so that the tourist over any given route will have all the information he needs on a comparatively small and inexpensive pocket folder.

"In the past motorcyclists have often had to rely upon the heavy automobile route books, and I know of one motorcyclist, liv-

A. M. Touring Bureau at work, of course, such action will not long be necessary. The time is past when motorcycle tourists can put up with makeshifts.

Mapping Is a Complex Task.

"I speak from inside knowledge when I say that probably not more than one agency providing route information and maps for automobile tourists has made any money at all—and that has been through bulk advertising—while thousands of dollars have been laid out by automobile organizations in the work. This money has been made up to a great extent in dues received from new members gained through the touring service, but in some cases it has been quite slow in coming back.

"However, map work done in the future will be much less expensive than in the past, principally because the United States Geological Survey sheets, the only basic reference material available for all, are now being issued more rapidly than ever before; each sheet lightens the expense of route and map work in the locality it covers. Furthermore nearly all the states now have State Highway Commissioners, or some department giving special attention to highway development and several of these bodies of commissioners have already issued maps of their own. The building of through highways and extensive signposting have also been of great assistance.

Some Practical Suggestions.

"All this helps the motorcycle tourist, but after all, his first requirement is a series of small-scale but clear maps, by which he can plan his trip over a large territory, see optional routes in their proper geographical relation and choose the one best suited for his tour. Maps of this character are not nearly as expensive as they were three or four years ago. Still if the financial burden was considered too heavy for the F. A. M. Touring Bureau at the present time, an arrangement might be made to use the plates of automobile maps, with a special motorcycle imprint.

"It might also be well to call the attention of motorcycle manufacturers to the fact that they can be of vast assistance to your new Touring Bureau. For example, a motorcycle manufacturing company in any State could send its testers and traveling men out with instructions to collect general road data in connection with their other duties throughout the State; this would en-

"Most automobile route books are too cumbersome for motorcyclists."

ing in Syracuse, N. Y., who bought two copies of a large road book, at \$2.50 each, and had a bookseller cut them up into sections and bind them so that they could be carried conveniently. The outlay on this basis would be \$10 or \$12 for a single State, and the tourist should not be called upon to shoulder such expense. With your F.

tail little additional expense for the company and would greatly advance the interests of the Touring Bureau. It is well known that the automobile manufacturers contribute liberally to the general work of the American Automobile Association, and the touring department gets a generous proportion of it for road maps. The manufacturers benefit directly through extensive touring and they are usually willing to render assistance.

Working on a Business Basis.

"I do not believe, however, that any map system for motorcyclists will be a success if it is made a display advertising proposition, as some of the automobile route publications have become. The time to prevent such a result is in the beginning. In my opinion a charge should be made for every map, though perhaps not large enough to pay the basic expense of its preparation within the first year or two.

"But if part of the first cost of the maps were divided among the makers of motorcycles and accessories no one would feel the burden, the investment of the manufacturers would soon be returned many fold and it is likely that such a map system would be self-sustaining after the third or fourth year."

A CONSERVATIVE CLUB.

EDITOR MOTORCYCLE ILLUSTRATED: In your December 12 issue The Timely Tipster referred to a Brooklyn motorcyclist who had made an unsuccessful search for a club composed of riders who do not go in for speeding. It was stated that the motorcyclist in question contemplated the organization of a "Forty-Five Club," to be made up of riders between forty and forty-five years of age, in order that he could have company on his leisurely rides into the country.

In this connection I would like to ask the gentleman where he has been keeping himself during the last year, and how the Brooklyn Invincibles have escaped his notice. This club has existed in his own city for quite a while, and I am certain it will meet all his requirements as regards conservative riding. If the dissatisfied rider will step around to 78 Herkimer street, Brooklyn, any Tuesday evening about 8.30 and inquire for a member of the Invincibles we shall be glad to make him welcome, and if he is of the sort that the Tipster's reference to him suggests he will be promptly invited to join our organization.

We have several members who can do some speeding when called upon—myself included—but we reserve our speedfests for the race tracks, where they rightly belong.

JOHN U. CONSTANT,
Publicity Committee, B. I. M. C.

BRAKES ON SIDECARS.

EDITOR MOTORCYCLE ILLUSTRATED: As a sidecar user I was interested in the observations of The Timely Tipster in a recent issue, relative to strains imposed upon motorcycle frames to which the passenger attachments are fitted, and I am moved to call the Tipster's attention to a custom, now apparently growing abroad, of fitting special sidecar brakes. Am I not correct in arguing that such a brake would materially increase the stress to which both the motorcycle frame and sidecar chassis are subjected? I agree with a writer in a recent issue of an English publication, who believes that the braking resistance would impose an unfair and unneces-

sary strain upon the forward members of the sidecar frame, and that the application of the brakes would have to be worked out scientifically to prevent not only undue strain, but the likelihood of a serious smash. As far as I know we are fitting no special sidecar brakes in this country, and I trust that our manufacturers will not take to the idea. In the first place, I believe the extra brake is a trouble-maker, add in the second place, I do not think we need it.

SIDECAR.

A MISSOURI LETTER.

EDITOR MOTORCYCLE ILLUSTRATED: I notice that comparatively few references are made to Missouri motorcyclists in your columns, and I infer that the boys out here do not go to the trouble of keeping in touch with you. This is somewhat excusable because riders are not very plentiful in our State as yet and there is not as much general interest as is found in most other sections. Still, it is my opinion that the Missouri boys who do ride motorcycles thoroughly enjoy them. I am now using my second machine, an Indian twin, which I ride to and from the school where I am an instructor. I have missed only two days since September 1, despite the fact that the mud here is of the variety that rolls up, sticks and causes much trouble after only a slight rain.

Just before the opening of the Fall term of school I made a trip on my machine to Des Moines, Ia., following the Wabash railroad most of the way. The roads east and west through Missouri are much better than those extending north and south, especially in the eastern part of the State. The roads in the northeastern districts are particularly bad in all directions. I returned from Des Moines via Oskaloosa, Ottumwa and Keokuk, in order to see the new dam across the Mississippi river, and it was well worth the extra traveling.

The gasoline consumption for a little over 737 miles was about 11 gallons. On November 16 I rode from Macon to Fayette, Mo., and return, a distance of about 125 miles, and my actual time on the road was seven hours, giving an average of 18 m. p. h. Most of the riders I have met here are inexperienced and their principal trouble is overheating of the motor, due to carbonization. If you decide to print my letter you might state that I would like to hear from motorcyclists along the Northern Pacific railroad in North Dakota.

JESSE FRANCE.

Macon, Mo.

BUFFALO NOMINATIONS.

AT the last regular meeting of the Buffalo (N. Y.) Motorcycle Club nominations of officers for the coming year were made as follows: President, O. H. Peters and A. D. Cook; vice-president, Ira C. Palmer and Bert Barrows; secretary-treasurer, George H. Hair; financial secretary, M. D. McDonald; directors, W. G. Schaack, C. W. Andrews, H. B. Clark, George M. Trefts, A. H. Peters and George Goetzmann; captain, A. J. Meyer, and lieutenant captain, A. Weiland, Charles Liske, William J. Mensch and H. H. Paeters. The election will take place on the evening of January 8.

MOTORCYCLE INSURANCE.

THE revised prospectus of the Auto-Cycle Union, of England, shows that insurance premiums are now based on the horsepower of machines only. There are two types of policies, the first gives complete indemnity while the other embodies certain restrictions.

C. W. WAUGHOP, 4914 Delmar boulevard, St. Louis, Mo., claims to be "the guy who put the son on Henderson." As might be inferred, Waughop has the Henderson agency in this city and is doing well with it.

BANQUET AND ELECTION.

PRECEDING the third annual banquet of the Cortland Motorcycle Club, which was held at the Messenger House in Cortland, N. Y., on Thursday evening, December 12, the members of the club met at the clubrooms and elected officers for the coming year. The new staff is as follows: Paul Parsons, president; E. C. Mead, vice-president; R. H. Ames, secretary-treasurer and W. J. Daymor, captain with F. C. Blankshine and George Green as his

lieutenants. The boys then proceeded to the banquet hall where they found a roast turkey dinner. After the dinner President H. J. Bromhill, acting as toastmaster, called for speeches. Later President Bromhill presented the president-elect with a gavel, decorated with the club colors.

Among the visitors present were: President H. G. Buckley, of the Utica M. C.; Mr. Race and Captain Miller, of the Ithaca club; George W. Fenner, of the Syracuse club, and Chief of Police, Fred Bowker.

Seymour, Crocker and Johnson, three Indian workers who have been "doing things" of late.

new manager of the Hendee branch in Denver, and Manager Johnson, of the new Atlanta branch appears at the bottom.

The panel at the left gives a head-on view of the new M. M. product, showing the neat lines and compact con-

IN the large photograph above is shown a striking view of the Indian stand in the recent English Show at Olympia. It will be noted that the display and the general arrangement of the stand are well up to the standard maintained by the Hendee company in its exhibits at the American Shows, and, what is more to the point, it is reported that the ice was broken for an unprecedented amount of business during the Show period. All the regular Indian models were shown, as well as an Indian with an attractive sidecar attachment, which will be noted inside the stand.

At the right of the Show picture appear three well-known Wigwam boosters, who have been getting into the trade limelight of late in this country. At the top is Ray Seymour, erstwhile Indian speedster, who is now traveling one of the Indian sales circuits. In the center is Crocker,

struction. The lower photo in the center introduces Gene Coughlin, manager of the recently opened Riverside motorcycle establishment in New York City, and in the panel at the right appear Russell Smiley and "Shorty" Matthews, both as well known now in trade circles as they are on speed circuits throughout the union.

BUSY C. M. A. CONVENTION IN TORONTO

Canadian Governing Body Adopts F. A. M. Racing Classifications, Retains President Spencer, Decides Upon Registered Repair Shop List and Considers Several Knotty Competition Problems.

TORONTO, Ont., December 20.—A meeting of the Board of Directors on December 19 opened the second annual convention of the Canadian Motorcyclists' Association at the King Edward Hotel in this city. The session was featured by consideration of an application of the Wanderers M. C., of this city, for a charter and by an application of Bob Scott to have his trophies returned. Scott was recently dropped from the Toronto club. The trophies referred to were won by Scott at the Ontario championship races on October 28, and after the meet claims were entered that he had used a special engine in competing in the private owners' class. The trophies that had been awarded to him were recalled. Now the C. M. A. Board of Directors has decided that there was no conclusive evidence that Scott used a special racing engine in the Ontario races, and an order has been issued for the return of the cups.

The application of the Wanderers M. C. for a charter was voted down, it being asserted that several of the leaders in the new club had caused friction in the Toronto M. C. There are indications, however, that another application will soon be made and that the directorate may reconsider its present action.

President Johnson Opened Session.

President Johnson, of the Toronto M. C., opened the program on Friday, December 20, with an address. This was followed by the report of President Spencer, of the C. M. A. He stated that the Canadian association had grown to about 500 members and that new riders were being taken in daily.

In connection with the report of the Competition Committee a point was raised anent the suspension of Swanson for riding at the six-day bicycle meet at the Arena in Toronto. This meet had no C. M. A. sanction, but Swanson persisted in riding after having received a warning. He has been suspended for two years. Harold Cole, on the other hand, declined to ride at the Arena meet when the conditions were made clear to him.

Application for Big Meet.

There was a discussion concerning the applications submitted by various clubs for the Dominion championship meet, and it seemed to be the consensus of opinion that the races should go to a western city; it is likely that Winnipeg will land them if a suitable track is afforded. Applications are now in hand from Vancouver, Victoria, Hamilton, Winnipeg and Toronto.

Letters were read from President Patterson, of the F. A. M., and from Chairman Thornley, of the Federation's Competition Committee, expressing regret that they were unable to be present at the assembly, and wishing the Canadian association success in all its undertakings.

The directors were authorized to obtain a suitable design for a metal emblem to be carried on the machines of members of the C. M. A.

President Spencer Retained.

President Spencer was retained by a unanimous vote and Fred Johnson was also elected

to the vice-presidency without a dissenting vote. Mr. Schmall, of Welland, was chosen as honorary secretary, and W. G. Tite, of London, as treasurer. Directors: Nelson Chambers, Hamilton M. C.; G. W. Lillie, Victoria M. C.; J. Scott, Toronto Wanderers M. C. (not affiliated); J. W. Cunningham, London M. C.; W. G. Self, Wanderers M. C., Toronto; J. M. Moorehouse, Winnipeg M. C.

After a recess it was decided that the Board of Directors should arrange for the registration of repair shops throughout the Dominion and that a list of such shops should be prepared. The shop registration fee was placed at \$5. The Board also decided to offer \$25 for the recovery of a motorcycle stolen from a member, after the policy of the F. A. M.

Resolutions were adopted providing that the traveling expenses of directors to meetings of the board within a reasonable radius be paid by the C. M. A.; that the C. M. A. receive 10 per cent. of the net proceeds of the Canadian championship meet, and that the sanction fee

be withdrawn if the percentage amounts to more than \$40; that the club handling the big meet be required to stage at least 16 events; that the classification of racers as professionals and amateurs be adopted, in order that racing regulations in the Dominion may be in accord with those observed by the F. A. M.; that all applications for amateur standing must be preceded by six months' absence from professional competition.

Motions providing that no motorcycle dealer be permitted to hold office in the C. M. A., and that the date of the annual meeting be changed to the summer were defeated.

Annual Banquet a Success.

The annual banquet was held at the Prince Charles Hotel and was a complete success. Addresses and toasts featured the programme and the presentation of the Hamilton M. C. cup to Dan Davis, who won the five-mile private owners' event in the Canadian championships, added to the enthusiasm.

A WINTER PROGRAM

GRATIFYING reports from the various committees were read at the December business meeting of the Providence (R. I.) Motorcycle Club. The Entertainment Committee announced an excellent program for the winter months. First on the list was a smoker, which will be held December 31. A nominating committee was appointed to select candidates for 1913 officers, the election of which will be held the third Friday in January.

JAMESTOWN STAFF.

AT the last regular meeting of the Jamestown (N. Y.) Motorcycle Club George Powers was elected captain, and Walter Chamberlain, first lieutenant. The following committee chairmen were also appointed: Albert Johnson, racing and touring; Elmer Ostrander, house, and Clarence Palmer, publicity. The business meeting was followed by a light luncheon.

SUCCESSFUL NEWARK DANCE.

ABOUT one hundred couples were present at the third annual dance of the New Jersey M. C., of Newark, held on Wednesday evening, December 11. Joseph H. Glenn acted as floor manager, and was ably assisted by C. E. Holgate and R. S. Pascall. The reception committee was headed by Walter Goerke. The program was well patronized by the local dealers, and a page was set aside in memory of Eddie Hasha and Johnny Albright.

TRADE STATISTICS.

IT is shown by statistics from Washington, D. C., that during the first ten months of this year motorcycles and other cycles were imported by the United States to the value of \$129,901. In the same report the given value of exported motorcycles and other cycles is \$864,272. A record kept of the motorcycle exports alone, from July 1 to October 31, shows 859 motorcycles, valued at \$155,265.

WILLIAM MAROHN and W. T. Mallow, of Cleveland, O., are motorcycling from their home to New Orleans, La.

PROVIDENCE SHOW.

PREPARATIONS have been completed for the annual Automobile Show in Providence, R. I. The Show is of special interest to the Rhode Island motorcyclists, as the motor two-wheeler will figure prominently. B. A. Swenson, Rhode Island distributor for the Indian, has contracted for three spaces and will not only exhibit a full line of the 1913 models, but will also display an extensive line of accessories and motorcycle clothing.

NEW TORONTO CLUB.

ABOUT forty motorcyclists of Toronto, Ont., some of whom were formerly members of the T. M. C., met on December 10 at the Woodbine Hotel and formed the Wanderers Motorcycle Club. It is stated that Toronto has about 800 motorcyclists, and about 200 of them are members of the Toronto M. C. Jack and Bob Scott took a leading part in the organization of the new club. Officers for the first year were elected as follows: W. G. Self, president; Claud Pearce, vice-president; D. J. Davis, secretary-treasurer, and Jack Scott, chairman of the executive committee.

RIVERSIDE PROGRAM.

NEXT Saturday, December 28, the Riverside Garage, 533 West One Hundred and Tenth street, New York City, will give a housewarming to mark the inauguration of the 1913 season of the Reading-Standard product in New York City, Westchester and Richmond counties. The Metropolitan trade, many of New York's riders, representatives from the R.-S. factory and press men will be present, and the managers will have "eats" aplenty. The fun will start at 8 p. m., and the program is under the direct management of Eugene Coughlin, the manager, and G. E. Wood, president of the company. The proposed new Riverside Motorcycle Club will be discussed.

ABOUT twenty-five motorcyclists of Houston, Tex., met at the Indian salesrooms on December 13 and formed a club.

WHERE ARE STARS OF YESTERDAY

Eastern Motorcycle Speedsters Follow Widely Divergent Paths When Snow Flies, But All Are Keen For 1913's Opening Gun.

FROM time to time followers of racing pass along the question: What becomes of the speed stars during the winter season? and there is no denying that considerable interest attaches to the boys who spin the tracks and bowls, even when their motors have been temporarily laid aside or shipped to distant territory. It is impossible to keep in touch with more than a few of the record-chasers as they go into seclusion for the winter or jump about the country, but now and then a little information sifts in.

Arthur Chapple, the Brighton speed king, recently accepted a position with the Good-year Tire Company and is now traveling in New England territory. He reports brisk business and asserts that a period of actual work goes well between racing seasons. "Chap" expects to run down to Florida early in February and go after a record or two. He has his eye on the two-mile mark particularly, and has hopes of putting a crimp in it. There is also a chance that he may go abroad late in the same month and ride a few races on English tracks.

Billy Wray, another Brighton favorite, is putting in the winter in the employ of a motion picture company, while his younger brother, Howard, was at latest reports still nursing a severely bruised leg as the result of a spill suffered late in the racing season. Shields and Lochnar, winners of the 24-

hour race at the Brighton track late in the summer, are both in Syracuse, their home town. The former has the Indian agency there and the latter is employed by a Syracuse telephone company.

Johnny Cox, the New York boy who is recognized as one of the most popular and consistent speedsters in the eastern division, is working as a demonstrator of motorcycles in New York City and making good, as usual. He is devoting himself particularly to the new Indian models.

Mike Costello, another New Yorker who stands high in the estimation of speed fans, is now running his own shop in Yonkers and is handling the Indian agency. If business picks up, as there are indications that it will, Mike will probably be seen in few races in and about the metropolis next season. He states, however, that he has not retired from the racing game.

Earl Eckel is operating a garage in Washington, N. J., his home town and will not slip into a racing saddle again until the eastern bowls open. Earl is one of the riders who are content to store their motors during the winter in preference to making long jumps to more hospitable climes.

Johnny Constant, the Brooklyn meteorite, whirls into our sanctum under full throttle at regular intervals, announces that he has quit the racing game, then sticks in a proviso or two and finally admits that he may ride a few more races. And so it goes.

TORONTO ELECTION JANUARY 8.

AT the meeting of the Toronto M. C., held December 18, nominations for the ensuing year were made. The election will be held on January 8. A plan was outlined for a membership campaign, whereby prizes will be awarded to the four members bringing in the most new members before the first of June, 1913.

A CLEAN RECORD.

MISS MARY RECKLEBE, of Wichita, Kan., is a young woman who took up motorcycling because her brother did. Miss Recklebe rode a twin all last season, accompanying the boys on many of their outings, and never met with an accident.

GRAND RAPIDS STAFF.

THE 1913 staff of the Grand Rapids (Mich.) M. C. is as follows: L. Berridge, president; C. E. Gable, vice-president; R. O. Chipman, secretary; C. H. Blakeslee, treasurer; S. Veenstra, captain; C. C. Cline, first lieutenant; J. Foster, second lieutenant; R. E. Heath, sergeant at arms, and William Stadel and Howard Ferguson were named directors at large.

NORTH SIDE MOTOR SQUAD

THE entire length of the North Side boulevards and parks of Chicago are patrolled by the North Side motorcycle squad, which is composed of five men. This small body of riders has done much to maintain the traffic laws in the North Side section of the Windy City.

A SUNDAY run, over a 100-mile course, was recently held by the Red Bluffs (Cal.) Motorcycle Club.

GRAVES AND PERKINS WIN

Fast Finishes Mark Events Staged at Emeryville Track, with Perkins a Surprising Newcomer.

SAN FRANCISCO, Cal., December 9.—Marty Graves, the Los Angeles Indian rider, and Dudley Perkins, the San Francisco Wigwamite, took the laurels in the championship motorcycle contest held on the Emeryville track yesterday. Earl Armstrong, who will be remembered as one of the crack riders in last season's events on the Elmhurst motordrome, and who appeared for the first time yesterday in the present meet, came in for marked attention by his clever riding. He issued a challenge to meet Graves in a five-mile match race.

Graves and Armstrong met first in the opening heat of the three-mile professional event, in which the former won out by a small margin. Perkins shows promise of being one of the best dirt track riders in the West. George Renel, who came here heralded as the French champion and who promised to ride rings around Graves, was last in every event in which he competed and showed none of the daring that characterized the riding of the American boys. Lee Flickenstein, who was looked upon to do some fast work, put his machine out of commission in the first event.

A COMBINATION MEET.

AEROPLANES and motorcycles figured in a combination meet held at the Woodland race track near Dixon, Cal., December 7, and speed fans were present from all the towns within riding distance. It is stated that another similar program may be held during January.

NO less than 2,500 spectators witnessed the motorcycle races between San Bernardino (Cal.) and Redland club riders at the former place on Thanksgiving Day.

T. D. ZINN, of Parkersburg, W. Va., riding a 7 h. Indian, recently took five firsts out of seven events at the Parkersburg fair.

President T. W. Henderson, of the Henderson Motorcycle Company, at the Wheel of His Winton Six, Greeting R. W. Wheat, a Henderson Salesman, on Belle Isle.

DE LUXE MOTOR IMPROVEMENTS FOR 1913

Products of Spacke Machine Company Retain Fundamental Features While Introducing Several Noteworthy Changes—Racing Type Roller Bearings for Connecting-Rod Crank-Pin in Twin Models, Improved Splash Oiling, Enclosed Valve Levers and Pins and New Priming Device

WHILE the well-known line of De Luxe motorcycle motors, manufactured by the F. W. Spacke Machine Co., of Indianapolis, will embody for 1913 the same general principles shown heretofore, there are a number of changes and refinements worthy of attention, as pointed out in the formal announce-

The De Luxe Twin, Made in 7 and 9 h. Types.

ment of the firm for the coming season. All the more important original features have been retained, among which are the rigid crankshaft, one piece crankcase with cover, improved cam and magneto drive and large import-

ends of the crankshaft, eliminating friction. The predominantly new points in the De Luxe motors for 1913 are the racing type roller connecting-rod crank-pin bearings for the twin motors, improved splash oiling arrangement, enclosed intake valve levers and pins and a simple priming device. That the new motors maintain the standard of quality which the trade has come to expect in Spacke products is evidenced by the fact that the company has already sold 15,000 motors for the coming season.

Racing Type Roller Bearings.

One of the most notable improvements in De Luxe twin motors involves the use of the De Luxe racing type of connecting-rod crank-pin bearing. The construction of this bearing is such that it is much larger in both width and diameter than other bearings of this style; it is not split into several bearings, each taking a separate thrust, but consists of one long bearing of ample area and great wearing qualities. The bearing rollers, which are hardened and ground, are contained in a steel cage and run between an inner and outer race, which are both hardened and accurately ground to size.

Striking Sectional View of De Luxe Twin Construction.

Improved Splash Oiling.

In connection with the fitting of the new type of bearing in the De Luxe twin motors, the oiling system has been modified, and an improved arrangement of splash oiling has been

adopted. The oil is introduced into the crankcase, between the cylinders and immediately over the crank-pin bearing, where provision has been made to take up the lubricant in such quantities as to insure at all times an adequate oil supply for this bearing.

Enclosed Valve Levers and Pins.

With reference to the enclosing of the intake valve levers and pins, a simple and effective arrangement has been devised. This consists of enclosing the upper end of the intake valve operating mechanism in a case, which is filled with hard grease and graphite, thus providing for the working of the intake valve pin and lever in a grease bath, and eliminating the necessity for the very frequent oiling which would otherwise be necessary. Further advantages are the elimination of the usual accumulation of dirt and grit in these moving parts, and the silencing effect of the covered mechanism.

Simple Priming Device.

In connection with the enclosed valve lever housing, a simple provision is made for priming on the De Luxe motors. By simply removing a screw the rider may inject gasoline, and thus obtain an easy start when exceptional conditions make such a procedure necessary.

On this page are shown illustrations of the interior of the De Luxe 4 and 5 h. single motors, and of the 7 and 9 h. twins. Another illustration of special interest is that which shows a skeleton or sectional view of the interior design and construction of the twin motors.

Four Standard Types.

As in the designing of previous models, it has been the aim of the Spacke experts to produce a line of silent, clean, fast and powerful motors without sacrificing sturdiness or simplicity, and it will be evident from the accompanying illustrations that they have been eminently successful. In this connection a diagram is reproduced on this page, showing the power performance of the 9 h. De Luxe twin special.

De Luxe motors will be offered to the trade, as heretofore, in four sizes: 4 h. single, 5 h. single, 7 h. twin and 9 h. twin special. They will be supplied for either belt or chain drive.

FOR WAR SERVICE.

IN discussing the possibilities of the motorcycle as a vehicle for couriers and for other emergency work in time of war, H. H. Windsor, a writer in *Popular Mechanics*, states that in his opinion the outcome of present tests will probably be a combination of motorcycles and bicycles. He refers to the fact that one motorcycle of any standard make is capable of towing four or five mounted bicycles over ordinary roads at from 15 to 25 miles per hour.

ENGLISH MILITARY TEST.

CONSIDERABLE interest was aroused by a recent run of 500 miles, made by two regulars of a motorcycle squad in the Highlands Division of the English Army. Two army sappers bearing the despatches from Aberdeen to the Lord Mayor of London, arrived at their destination safely after 37 hours of almost continuous riding. The ride was started shortly after 9 o'clock in the morning, and it was after 10 p. m. the next day when the worn-out riders reached London. A heavy rain and a strong head wind lasted for 13 hours of the trip.

De Luxe Single, Produced in 4 and 5 h. Models.

FRICITION IN FRANCE.

A SPIRIT of discord pervades French motorcycle circles. For some time past the Automobile Club of France, which has a subcommittee for motorcycles, has been the governing body. Friction arose a few weeks ago when the Federation of French Motorcyclists was organized at Lyons. While the rules and regulations of the organizations agree, they both claim the right to control competitive events. The A. C. F. is determined to run its own program of events and disqualify any rider participating in meets not having its official sanction. The federation is resolved to do the same. Although the federation has the advantage in numbers, the A. C. F. has the backing of the manufacturers. The Automobile Union of England recognizes the A. C. F.

A CARMINE colored Emblem motorcycle recently was stolen from Jerry Walling, of Saddle River, N. J. The engine number was 4115.

NEW YORK'S \$50,000,000 ISSUE OF ROAD BONDS

THAT New York State does not intend to shirk its responsibility with reference to road improvements is indicated by the authorization, at the last general election, of an issue of bonds to the extent of \$50,000,000, for the completion of the system of State highways and to pay the State's share of the outlay for State Aid county roads. The system of state highways was authorized under laws of 1909 and later amendments, and is intended to cover 3,515 miles in all. About 2,000 miles have already been provided for in the plans of the Highway Department, and the remainder will be covered by \$20,000,000 of the new bond issue. The balance of \$30,000,000 will go to the State Aid county roads.

Recent amendments to the county road law provide that all town road levies shall

Empire State is Now Prepared to Complete Its System of Highways Covering More Than 3,500 Miles.

be reserved for the improvement of town roads, and the maintenance and improvement of country roads, as in the past, will be handled on a basis of 35 per cent. of the cost from the county and the remaining 65 per cent. from the State. The population of each county, the road mileage of each county, outside incorporated cities and villages, and the area of each county are each divided by three, and the addition of these three factors or thirds of population, mileage and area, for each county, as compared with similar factors from each of the 59 counties in the State, indicates the propor-

tion of the fund which each county will receive. Of the county highway system of 8,380 miles a little over 3,000 miles have been completed or are under contract, so there will be available about \$6,000 per mile for the State's share of the outlay for completing the roads in this system.

This arrangement, considered with the fact that there will be approximately \$13,000 per mile for completing the remaining 1,500 miles of the State highway system, gives assurance that both county and State roads are to be well cared for. It is worthy of note that the State and county systems are provided for separately, and that the State highways can be improved and built as rapidly as plans are prepared and contracts awarded, without interfering with the fund set aside for county roads.

NEW MARYLAND ROADS

State Highway Commission Has Been Reorganized and Many Districts Show Improvements.

GENERAL activity followed the reorganization of the Maryland State Highway Commission last spring, and the improvement work was kept up to such good effect throughout the summer that the State is now in possession of nearly 500 miles of good roads. To be exact, there are 465 miles of State roads in use, and with the money available for further work it is expected that this total will be increased to 800 miles in the not far distant future. It is the intention to treat nearly all the macadam roads with oil for the 1913 season; over 200 miles of highways were given the oil treatment this fall. The State has built 275 miles of road and has taken over turnpikes figuring up to 190 miles, thus making up the total of 465 miles above mentioned.

In nearly every county sections of roads are under construction. The Washington boulevard is nearing completion, except at the village of Elkridge, where work has been held up pending arrangements to obviate a dangerous grade crossing over a railroad line. With the exception of the stretch on Hanover street, in Baltimore, the Annapolis boulevard is practically finished, and funds are in hand to carry the work through. With this improvement completed and the new \$1,000,000 bridge constructed across the Patapsco river, a fine highway will be provided from the center of Baltimore City to Annapolis.

In Southern Maryland sand-clay-gravel roads are being built, and on the eastern shore there is no road material except oyster shells. These have proved unsuitable for main roads. Macadam is being used extensively, and in some sections it is likely that concrete will be worked into the more important highways.

SIGNPOSTING A DESERT.

SOME idea of the extent to which road improvements and signposting are receiving the attention of officials may be gained from the announcement that 150 signposts recently arrived in Barstow, Cal., for use in the Mojave desert. Heretofore

the Mojave desert trail has been one of peril, and several motorcyclists and automobilists who crossed underwent severe hardships. The purchase of the signs is the outcome of a campaign waged for years by the Los Angeles Times to have safeguards thrown out for the desert traveler.

MAY ADMIT MOTORISTS.

AS the result of a conference held in October the Yosemite National Park may be opened to motorists some time during the coming season. Walter L. Fisher, Secretary of the Interior, will not oppose motoring traffic through the park if a suitable route is found to and from the floor of the valley. The A. A. A. and the Automobile Club of Southern California are bringing influence to bear to have necessary improvements and road extensions made so that tourists, both automobilists and motorcyclists, may be admitted with safety to the park's scenic wonderland.

BUILDING CANADIAN ROAD.

WORK is now progressing on the King Edward Highway which is part of the Canadian portion of the Montreal and Miami Highway, extending from Longueuil to Rouse's Point at the international boundary. The construction is under the direction of the Provincial Government of Quebec.

WANT CROSS-COUNTRY ROAD.

A PROPOSITION is to be submitted to the Canadian Parliament for a transcontinental highway from east to west, a distance of 3,900 miles, says the *American Motorist*. It is estimated that the road would cost \$26,000,000.

MOTORISTS in Missouri are seeking State aid for the improvement of roads, and a bill may be presented to the next Legislature.

THIRTY days after the fund was opened for the construction of the proposed ocean-to-ocean highway the subscriptions exceeded \$1,000,000. This figure was reached about October 20.

WOMEN of Leanna, Kan., turned out in force recently and built a stretch of rock roadway 800 feet long through a cemetery, after the men of the town had shown a disinclination to make the improvement.

PROGRESS IN CALIFORNIA

State Highway Department Awards Road Contracts Under \$18,000,000 Bond Issue of 1910.

DURING the past summer a number of road building contracts were awarded by the State Highway Department of California, under the bond issue of \$18,000,000 authorized two years ago for a system of State highways. Provision was made in the system for a road down the coast, another along the valleys east of the coast range of mountains, and for various branches to reach the county seats not touched by the main highways.

When the bond issue was provided for it was taken for granted that macadam would meet all requirements as a road material, but the experiences of other states and the rapid development of traffic over California highways have led the officials to believe that a more durable surface is needed. There is considerable sentiment in favor of roads built of concrete with bituminized surfaces, and contracts have been awarded for several comparatively short stretches on this basis. In this connection, however, it has been pointed out that with the present bond issue it would only be possible to improve the roads near the cities, and that the plan for a State highway system worthy of the name would fail of its purpose. The officials therefore have two courses open to them: To proceed on the original specifications, under the \$18,000,000 bond issue, or to seek additional funds with a view of providing highways calculated to withstand the State's rapidly increasing traffic.

TOURING IN THE SOUTH.

MOTORCYCLISTS and autoists who go into Maryland, Virginia and North and South Carolina at this season are often given a surprise by the climatic conditions, says an exchange. While these States average considerably warmer than New York, New Jersey and Pennsylvania, for example, it is often uncomfortable to motor through them much later than the end of the northern season. The hilly sections of these States tend to offset the difference in latitude, and in order to find a marked difference in the climate it is necessary to go farther south.

ELSEWHERE in this issue is a brief but timely reference to the national information bureau maintained for dealers under the auspices of the Motorcycle Manufacturers' Association. It is stated simply that the bureau is supplied with a new batch of helpful literature and suggestions, preparatory to the opening of the 1913 selling season, but this announcement should be sufficient to start a deluge of postcards flowing to the Indianapolis headquarters of the bureau. Here at last is offered something for nothing—if we are generous enough to overlook a moment's time and the outlay for a postcard. There is no other cost.

Acting upon the sound theory that the advancement of one predicated an influence for the uplift of all, the manufacturers of motorcycles have gone to great pains and considerable expense to establish the information bureau and place it upon a practical basis. They ask in return that dealers throughout the country co-operate with them to the extent of applying for the literature, and the specially prepared advertisements, and of using both to the limit of their individual opportunities. Manufacturers realize, of course, that every satisfied, enthusiastic dealer is a valuable asset; that enthusiastic dealers are over the sales-makers, and that all our sentimental interest in the future of the motorcycle will avail us nothing if we neglect to reach out for those thousands of potential recruits to be found from coast to coast. In short, manufacturers need sales, but no more than the dealers need them—and certainly no more than the sport needs them.

After all, what is the psychology of sales-making? Is it to be summed up in contracting for new models, placing them in a showroom and then settling down to wait for the chance patron who may have decided that he needs a motorcycle? We venture the opinion that there is little of psychology—or any otherology—in this. No, scientific selling implies the ability first to produce a need, if necessary, and then to fill it. It means that the dealer must clear away any erroneous impressions concerning the motorcycle that may befog the public mind in his district; that he must sow the seeds of friendly interest during every waking hour, and finally that he is to approach each prospect with the most practical, appealing arguments available for the individual case. The latter is two-thirds of our high-brow, friend psychology—reduced to plain, straight-from-the-shoulder dollars-and-cents English. There's nothing more to it. Simply show a prospect why he needs a motorcycle, and the sale will make itself.

But clearing away the unfavorable impres-

sions, sowing the aforementioned seeds of interest and tucking a productive suggestion into the mind of a near-patron at just the proper time and in the way that will do him and you most good are phases of a fine art. They come naturally to but very few of us. We need training; we need to profit by the experience of others if we are to progress rapidly, and this special training and the advantages of just such experience are offered by the national information bureau for dealers. That's why your postal is bound to bring you something that will advance you as a salesman.

WOULD there not be a field for the sale of a replica in metal of the F. A. M. emblem, constructed so as to be adaptable for fitting to the front mudguard or the top of a lamp? There can be no doubt that such devices are aids to dignified publicity; that they enliven club pride and exert an influence favorable to cohesiveness in an organization, the latter property being especially needed where members are distributed over such a wide area as our own country. Perhaps there is such an F. A. M. device on the market, but we do not recall having seen one. They are quite common among motorcyclists in England and other European countries, and there appears to be no worthy reason why our governing body should not be similarly represented on the roads.

ATTENTION has been called to the fact that the English Auto-Cycle Union classifies its records according to the size of the motor used, and a recent correspondent suggests that it might not be amiss for our own governing body to consider a sub-classification in order to permit of 30.50 records, for example, on this side. This is an idea that may properly come in for consideration by the F. A. M. at no far distant date, especially in view of the fact that the English 30.50 hour record is now quite close to our own 61.00 mark. It is likely that the recognition of 30.50 records in this country would do much for the development of the single-cylinder machine, although such a course would no doubt bring its drawbacks in the way of further complications for the F. A. M. Competition Committee to untangle.

BALTIMORE motorcyclists petitioned the police authorities of their city to rule against the use of certain streets by juvenile roller-skaters, on the ground that the youngsters dodged to and fro in such fashion that riders could not gauge their movements, and with little loss of time a restrictive ordinance was passed. There is a regrettable impression

among motorcyclists that they can never hope for anything but speeding fines and general antagonism from police officials, and the achievement of the Baltimore riders is notable as showing results to the contrary.

THEY presented a dignified appeal on reasonable grounds and found the authorities ready to meet them half way. Life might be pleasanter for both motorcyclists and police officials in many other cities if a similar policy of co-operation were to be persisted in. After all, traffic cops and their superiors are human beings, not merely blue-coated machines fired with a diabolical determination to chase motorcyclists off the map or wring their last simoleon from them on sight. Keeping this in mind will often work wonders.

IT is at least consoling to know that American motorcycle manufacturers who exhibit in the national shows will not have to contend with the elusive cyclecar of our English brethren, which refuses to be definitely cataloged. On the other side the cyclecar's comparatively slight claim to relationship with the motorcycle kept manufacturers of the latter on the anxious seat during the Olympia Show, while the growing realization that the cyclecar is, after all, only a speedy, low-priced automobile gave builders of the standard four-wheelers many an uneasy moment.

THAT the word "refinement" is sprinkled liberally throughout the announcements of 1913 models is significant. It implies that wide-awake designers and engineers have not as a rule, found radical changes from 1912 construction justifiable. Even where several marked alterations are shown in a new model it will be noted that much of the ingenuity of the designer has gone into the refining of parts and fittings, thus indicating that the basic ideas involved in the latter have proved their worthiness.

CLEVELAND'S motorcycle show for 1913 will share 60,000 square feet of exhibition space with the automobiles. Dope from the Ohio city says: "Play Cleveland in the money. New York and Chicago Shows a dead heat, and Cleveland a good third."

ENGLISH motoring circles are agog over the promised advent of a cyclecar fitted with a two-stroke twin engine, a departure in power plant makeup for these vehicles.

MORE motorcycles than have appeared there for years past were shown in the recent automobile, motorcycle and cycle show in Paris.

ENGLISH NOTES "BRITISHER"

Olympia Show Proves
Cyclecar Boom Premature;
Three-Speed James Motor-
cycle Scores a Hit; A. S. L.
with Air-cushion Springing;
More Cyclecar Designs.

THE briefest glimpse of the glittering stands in the leviathan exhibition at Olympia proved that ardent riders and a hotheaded press have hustled the trade along too fast in the direction of cyclecars. If I omit the half-dozen makes which have made good on the road during the last two seasons, there were not four makes in the Show I should care to buy. It is a bad sign when a maker is afraid to exhibit a stripped chassis with naked works; it is a bad sign when you find the floorboard nailed down, so that you cannot scrutinize the innards; it is a bad sign when a maker has no demonstration vehicle waiting at the entrance, for you to make a road trial; it is a bad sign when you see a machine marred by grievous technical flaws, sure to create trouble within a hundred miles on the road.

Beyond contradiction the sudden and artificially-stimulated boom in cyclecars has caught the trade napping. Many firms have hastily gummed together a few bits of metal, dumped a pretty little red torpedo body on top, with a rakish scuttle dash, and called it a cyclecar. Quite a number of the vehicles exhibited have never smelt the road at all; few of the makers have got their jigs set up, or organized their production, or even fixed on their final specification. One much-boomed example was feverishly varnished in the freight van as the express train rushed it up from Coventry. On the whole I much question whether a number of builders will be able to make deliveries inside six months; and when deliveries begin it is doubtful whether the first batch that gets through from some of the factories will be up to much real work. I estimate that the passenger vehicles of 1913 will be chiefly limited to sidecar outfits, to the pioneer cyclecars introduced in 1910-1911, and to three or four of the new débutantes. Nothing startling need be expected of most of the new designs.

Cyclecars on the Road.

SOME twenty samples were marshalled at the big entrance portico, and were kept very busy giving joy rides to the "nuts." Few of them looked at all smart. The majority resembled a coal scuttle on perambulator wheels, and their fair passengers screamed when a huge motorbus loomed close to the low flat seats. Off-hand, one would ex-

pect wire wheels to look their best on such tiny machines; but actually the only really smart cyclecar was the Singer, which has detachable steel artillery wheels (Sankey patent). Others were grossly disfigured by motorcycle engines. A V-twin engine, with cylinders at 50° and small enclosed flywheels does not readily run slowly, and is uneven when throttle down. Add the sharp terrier bark of a motorcycle exhaust, and it is obvious that the cyclecars were not impressive, as they stood by the curb with engines racing free.

I except two or three small four-cylinder engines with good carbureters and efficient mufflers; also one or two twins, with 90° or vertical cylinders, and heavy outside flywheels. One thing is certain, viz., that the 90° twin will soon oust the 50° type for cyclecar use, and that a heavy outside flywheel of large diameter will displace the usual motor-bicycle type. It gives as good a balance as a four-cylinder.

Widely Varying Transmission.

THE firms who make a specialty of supplying engines are all turning out huge 90° twin-cylinders of about 1,000cc. capacity, with heavy-rimmed external flywheels of large diameter; but at the moment the demand for these engines exceeds the supply, and in addition existing chassis are seldom suited to them. When the power reserve is small, it does not pay to set the engine athwart the frame, and lose power by right-angled transmission; but if the 90° engine is set longitudinally, the chassis has to be lengthened and all jigs renewed.

The springing was better than I expected, but varied much in type; a common design consisted of a traverse spring in front, with half-elliptics astern, damped by grass-hopper supplementaries on the rear shackles.

The James Three-Speeder, a Striking Model in the English Show.

These gave quite comfortable riding on city pavements at 20 miles an hour; but, of course, a quarter-ton vehicle is bound to joggle a bit on country roads at high speeds. The seating accommodation was sparse on many types; some of the seats were only 34 in. across and 12 in. deep. Transmission embodied every conceivable type, including belts in various combinations, chains and belts, gear and belts, gear and chain, gear and bevel shaft, gear and worm shaft, chain and friction disc.

Sociable Seats in Demand.

TANDEM seating was obviously at a discount, and the side-by-side method of seating is certain to become standard. Tandem seating is very popular on the light imported French machines, which are too flimsy to make good over here. There were plenty of three-wheeled cyclecars on exhibition, some of them very strong and heavy. The two main drawbacks of this type are the difficulty of making the back wheel easily removable and the difficulty of keeping the back wheel vertical when its tire is deflated (any failure to keep the back wheel permanently vertical and in track spells a smash, being equivalent to a steering failure). Knockout spindles, spring-clip chains and snick-jointed brake rods dealt efficiently with the first problem, and the second is usually tackled by mounting the rear wheel spindle on a rigid rear frame and superimposing quarter elliptic springs which insulate the tail of the coachwork only.

At present confusion reigns supreme; you get three-wheelers with both one and two-driving wheels; four-wheelers; twin-cylinder engines of 1,500 cc., singles of 500 cc., four-cylinders of varying capacities, V and vertical twins; engines set longways and engines set crossways—a dozen different types of transmission; tandem, side-by-side and vis-à-vis seating; air cooling and water cooling; spider, skeleton construction on bicycle lines, and small scale fac-similes of the millionaire's automobile de luxe. Es-saying the risky role of the prophet, I outline future crystallization of stereotyped design along two main lines, somewhat as follows:

1.—Cyclecar de Luxe.

Four-cylinder water-cooled engine of 1,000cc. Three-speed and reverse gearbox, channel or pressed steel frame, cone clutch,

bevel drive with two enclosed universal joints, detachable wheels, full automobile specification, coach-built torpedo two-seated body, selling at about \$900.

2.—Ordinary Cyclecar.

Light tubular frame, air-cooled engine, either 1,000cc. twin or 750cc. single-cylinder long stroke (say 85mm. x 130mm.); engine carried in front under dummy bonnet with wire-mesh front; drive by chain or shaft (through clutch) to countershaft, on which are mounted variable belt pulleys, whence drive goes by 1½-in. belt to drums on rear wheels; solid rear axle, corners being negotiated on belt-slip; light skeleton body, very low, of two-seater torpedo type. Selling at about \$450.

Some Leading Cyclecars.

I HAVE already described the leading pioneers, of which the two to achieve real success are the G. W. K. and the Morgan. The G. W. K. is outwardly a small automobile; it has a dummy bonnet in front, and under its rather long and ugly tailboard is ensconced an 8-10 h. twin-cylinder vertical engine, driving the rear differential axle by friction discs. It costs \$750, complete with hood and screen. The Morgan represents the limit in lightness and simplicity. It is a three-wheeler of the single driving type.

A V-twin air-cooled engine is set athwart the frame in front, under a dummy bonnet;

Lycett Belt Punch, an English Novelty.

this engine measures 85mm. x 85mm. and drives through a cone clutch and propeller-shaft to a gearbox set just forward of the driving wheel; the gearbox consists simply of a sliding dog clutch, which couples up either of two chain and sprocket drives to the rear wheel. The body may be either a single or double-seater, at the buyer's discretion. As the entire chassis only scales 250 pounds, it is plain that this is a very lively and rapid little mount. It costs under \$400.

Three New Cyclecars.

THE cream of the newcomers are the Swift, Singer and Perry. I append brief specifications of each.

Swift.—Small car type, water-cooled vertical twin-cylinder engine, 75mm. x 110mm., in front under bonnet. Bird-fountain oiling, thermo cooling, leather cone clutch, three speeds and reverse (sliding gear, direct on top). Bevel drive, differential axle, tubular frame, with engine and gearbox on tubular sub-frame. Rack and pinion steering. Price \$682, with hood and screen.

Singer.—Channel steel frame, inswept at dash, unswept astern. Four-cylinder water-cooled engine, cast in pairs, 63mm. x 88mm. (top speed, 45 miles per hour; runs 45 miles per gallon of gasoline). Forced pump lubrication, propeller-shaft drive to three-speed

and reverse gearbox mounted on back axle. Five detachable steel artillery wheels. Streamline torpedo two-seater body, with side doors, taper bonnet and scuttle dash: 7 ft. 6 in. wheel base. Tires, 700 x 80mm.; domed mudguards; automobile control. Price \$925.

Perry.—Two-cylinder vertical water-cooled engine, 72mm. x 108mm.; chain-driven timing gears and magneto, clutch-case and three-speed gearbox bolted to crank-chamber on unit lines; shaft-drive to overhead worm on rear (differential) axle; De Dion type plunging joints at both ends of shaft; channel steel frame; four brakes on rear hubs. Price, \$800.

The James Three-speeder.

TWO motorcycles in the show struck me as embodying the lines on which future progress in Great Britain is most likely to be based. The three-speed gear is already admitted to be our ideal, but only two or three makers have succeeded in perfecting a light and reliable three-speed box for the countershaft position. Of these I illustrate the James, which has an 86mm. x 96mm. single-cylinder engine, with staggered radiating fins, effecting the maximum cooling effect. The three-speed gear is mounted as a bottom bracket countershaft, thus concentrating the weight in the center of the wheelbase and securing an easily removable back wheel. The drive consists of two totally enclosed chains. The front chaincase is a very handsome aluminum casting, longitudinally split, and the rear chaincase is of sheet steel; both contain oilbaths. In the gearbox is embodied a neat kick-starter, and the labor required to operate the kickstarter is considerably reduced by means of a decompressor; the decompressor operates on the exhaust cam and is controlled by a handlebar lever and encased flexible wire.

The gear is very simple, consisting of a layshaft and sliding dogs. It is controlled by a substantial lever, working on a spindle carried in a lug brazed to the lower top tube of the frame, just under the tail-end of the gasoline tank. This model costs \$315, and scales 240 pounds. It may be had with lugs brazed to the frame, ready to hold sidecar fixings immovably; and it presents the thickest cream of our motorcycle industry. Its rivals will follow these lines next year, though the three-speed hub makers are trying to adapt their gears for the countershaft position, in which case all-chain drives are not likely to be popular.

Riding on Air.

ONE of the finest spring frames I have ever bestriden is made by a firm known as "A. S. L. Patents," and their system consists of hydraulic pistons. The spring forks and rear frame unit terminate in blunt-headed pistons working in metal dash-pots, but the pistons operate not against coiled metallic springs, but upon cushions of air. The joint

English A. S. L., with Air-Cushion Springing in Rear.

is preserved by what is known as a "mitten"; in other words, a small cylinder of rubber-proofed fabrics, of which the exact composition is a secret. The fabric has necessarily to be exceedingly tough, as it is subjected to continual friction, and is fixed by metal locking rings.

I find that such a mitten will last about 1,000 miles, and its cost is \$3. This is a trifle expensive, but for really rough roads it is well worth its price, for I have found the machines comfortable when fitted with only 24-inch wheels, and a rigid saddle, even over the worst going. One great merit is that the strength of the springing is always adjustable, for a tire valve is mounted on the dash-pot, and the pressure of the air can always be raised or lowered at will. The success of the firm has been hampered in the past by a freakish liking for 24-inch wheels, and the substitution of a church hassock for a saddle. However, they are now manufacturing on more conventional lines, and they are selling a separate spring seat-pillar which will serve to advertise the merits of their patent. When they can cheapen the cost of replacement mittens they will make good over all metal springs. A cut shows the outline of a complete A. S. L. machine.

A RUN TO SALINAS.

MEMBERS of the San Francisco M. C. participated in a run to Salinas, on Sunday, December 15. The course was via Pescadero and Santa Cruz, and the return was by way of Gilroy and San Jose to Oakland.

H. B. Cohen, Secretary of the National Capital M. C., of Washington D. C., and a Motorcycle Booster of the New School.

MOTORCYCLE IMPROVEMENT CONTEST

First Prize, \$50 in Cash

Second Prize, \$25

Third Prize, \$15

Fourth Prize, \$10 Total, \$100

FINAL SELECTIONS IN CONTEST

BELOW are the final selections in the Improvement Contest, received before December 20, the closing date assigned. Over one hundred contributions have been received since the first announcement, but only a moderate proportion of them could be considered eligible. There were numerous cases of contestants submitting similar ideas, and those whose letters reached the Editor first were given the preference, in cases where merit was equal. We recapitulate the more important conditions of the Contest herewith:

Points that will be considered in judging are: (1) necessity, (2) safety, comfort and convenience, (3) adaptability, (4) mechanical per-

fection, (5) reliability, (6) manufacturing cost, (7) durability, (8) simplicity, and (9) neatness.

In the event of a tie for any prize on the above method of scoring points, such a tie will be broken by considering the extent to which the suggested improvements would respectively add to the popularity of the sport or the commercial value of motorcycles.

The prize winners will be determined on the point system as outlined above by the editors of *MOTORCYCLE ILLUSTRATED* who, in making their announcements, will give the detailed scores of at least the twelve best suggestions.

The four winners will be announced in the next issue, that of January 9, and the prize designs will be republished.

TANK FRAME CONSTRUCTION.

A TANK FRAME with special arrangements for oil and gasoline, and a space for a Presto-tank is offered in the Improvement Contest, as shown herewith. The tubing is to be $3\frac{1}{2}$ inches in diameter with the cradle loop $1\frac{1}{8}$ inches only. A reserve section for gasoline is controlled from the lower tube, and a pet-cock is fitted to draw off the

contents when desired. A sight-glass is fitted to the lower tank member as shown. The drive is a combination one; chain to the countershaft and V-belt to the rear wheel. The Presto-tank is carried in clips in the space between the top and lower horizontal tubes. To the front rockers are fitted friction disc shock absorbers of the automobile type. Contributed by H. H. Canterbury, Redlands, Cal.

AUXILIARY OIL PUMP.

A POSITIVE oiling system which will give an amount of oil according to the speed of the motor and regularly instead of at intervals is here shown, adaptable to any motorcycle. All working parts are easily reached for adjustment and the cost of making would be low. The impulse piston is operated by the motor piston, moving to the left on the suction stroke and to the right on the compression, firing or exhaust stroke. As soon as a "working" stroke has been completed, the return spring forces the impulse piston to

the left again. Within the pump body is fitted the oil piston, forming part of the impulse piston. When the latter is moved to the left by the spring, the oil piston draws a charge of oil through the supply pipe, unseating the upper ball valve. On the pistons moving to the right, the upper ball valve closes and the lower one opens, the oil being sent into the chamber having the oil delivery valve and pressure valve at opposite ends. The rider can regulate the amount of oil in this chamber by the pressure regulating valve, there being a by-pass returning surplus oil

to the tank. The drip through the sight feed is regulated by the delivery valve. By adjusting the stroke regulating valve, the pressure (from the cylinder) on the impulse piston can be adapted to suit the running of the motor. Contributed by J. R. Paddock, Jr., East Orange, N. J.

REMOVING CLUTCH PLATES.

IT is sometimes a very tedious task to remove the plates from a multiple disc clutch, especially when they are clogged with gummy

oil. The tools shown herewith are made from pieces of stiff iron wire, having a loop handle at one end and a small hook at the other. The tools are inserted in the notches on opposite sides of the plate, when the latter can be removed in a few seconds. Contributed by Jerome S. Farnsworth, New York, N. Y.

DUPLIX FRAME.

TO prevent side-swing when striking bad
ruts, etc., a duplex frame with the mem-
bers connected by cross-pieces is suggested.
There is but one fork head, C pieces from
this head fit within cylinders A and B as
shown in the main view and in detail. Con-
tributed by Harry Townhill, Cleveland, O.

A NOVEL STAND

WITH a view of producing a motorcycle stand device that will enable a rider to place his machine in motion without dismounting to raise the stand after starting his motor, Samuel T. Steinberger, of Peoria, Ill., has invented the attachment illustrated herewith and obtained patent 1,039,838. Figure 1 shows

a side view of the Steinberger device and discloses the cylinders upon which the inventor depends for results. The cylinders permit of a telescopic action, which takes place when the rider releases a valve in a duct or pipe connecting the cylinders, and thus the rear wheel of the machine is lowered gently until it strikes the shoe of the stand and pushes it backward, the rear wheel of the machine being in driving motion at this time. When the stand is pushed backward the wheel reaches the ground and the stand device is automatically carried up until it is caught in the regulation holding clip on the mudguard.

ACETYLENE ADAPTER.

TO run out of fuel occasionally is the lot of most users of the two-wheeler, but the rider who has an acetylene tank and fits the following attachment can get home on the dissolved acetylene contained therein. The shell of the auxiliary air valve casing is formed with a canal whose exit is in the bevel seat of the leather air valve. The outer end is connected to tubing communicating with the gas tank, a cock with graduated index being interposed in the line. When the gas is to be used, the cock is opened and the air valve spring has its tension adjusted to suit. The gas is fed only when the valve lifts, and the device thus acts like a mixing-valve, such as is used on motorboat engines. Contributed by Earl Cline, Marietta, O.

PRIMER COMBINATION.

A COMBINATION priming attachment and carbon remover is here shown. An auxiliary tank is fitted to the frame and divided into two compartments, to a Y connection are fitted two tubes C and C', communicating

The operation of the cylinder system to produce the telescopic action is rather intricate. The valve above referred to may be adjusted to the weight of the rider, so that when it is opened—by any connecting arrangement the rider may desire—it permits of a varying flow of oil or other liquid between the cylinders, and this coupled with the action of coil springs that are housed in the cylinders allows the rear wheel of the machine to be lowered slowly to the ground to disengage the foot of the stand.

NEW MOUNT STOLEN.

A 7 H. BELT-DRIVEN Excelsior, 1913 model, is reported as having been stolen from the Ford Motorcycle & Auto Supply Company, of White Plains, N. Y. The words "Ford Motorcycle Co., White Plains, N. Y., Distributors" were stamped in the top of the valve-gear case. The engine number is 38,624. A reward is offered for the recovery of the machine.

A MOTORCYCLE GUN.

FOLLOWING the adoption of the motorcycle for army service in England, a motor-mounted quick firing gun has been produced.

OFFICERS FOR 1913.

AT a recent meeting of the Butte (Mont.) M. C., officers for the coming season were elected as follows: Mike Cannon, president; W. M. Buzzo, vice-president; B. Opie, treasurer, and Will Sherwood, secretary. Jack Conway was chosen captain.

A membership gain of 50 per cent within the last year is the boast of the Atlantic City (N. J.) M. C.

respectively with the gasoline in A and the carbon remover fluid in B. A pipe D leads to the air intake of the carburetor E. By opening either cock and turning the motor over, it may be primed or have the carbon cake loosened. Kerosene is recommended as the carbon remover. Contributed by Karl Knoerle, West Plains, Mo.

ENCLOSED MOTORCYCLE.

AN enclosed motorcycle is suggested, the enclosure being made by a shield A on each side fastened with brackets B in five places. At C the shield is bent to act as a scoop and force the air to the cylinders. A cut is made along it at D, and a door is fitted at E to give access to the carburetor. G is a hole for the pedal crank and at F it follows the frame line again. The shield protects the rider from oil and the motor from dirt and water. Contributed by B. B. Hitterdal, Hitterdal, Minn.

GUARD AND SILENCING DEVICE.

A DEVICE for fitting around the valve stems and springs of a side-by-side motor to render the operation quieter and guard the rider from oil, etc., is here illustrated. The guards are in the form of half circles BB and are channeled at their center parts for a collar C which locks them together fitting into the channels D. The parts B are to be made of thin tin and C can be made from a clock spring. Contributed by Walter Butler, Calistoga, Cal.

NON-LEAKING TANK CAP.

WITH a full tank of gasoline, many vented tank filler-caps are prone to leak, and when fitted to a threaded collar often are removed with difficulty. A cap to overcome these disadvantages has a bayonet-lock, the cap carrying the studs E on the body A. The collar D is grooved for the joint and there is a washer B for sealing against leakage. The cap has a chamber C and is provided with a hollow metal bottom, which has a vent in it. The upper part of the cap is also vented at V. Any gasoline that enters the lower vent is held in the chamber C and drains down again into the tank. Contributed by Harold R. Shoemaker, Syracuse, N. Y.

QUESTIONS and ANSWERS

WHILE the answers to Question No. 11—"Why are the cylinders of a twin motor fitted at an angle?"—were, as a rule, most excellent, the matter of cooling apparently did not occur to any of the contributors. Some of the reasons given were susceptible of questioning; thus there might be a four-cylinder motor with cylinders at 15 degrees arranged as a square, in block, with each pair working on a crank and taking up but slightly more space across the frame than a single or twin. Now, with water-cooling this type has been very successful, but never with air-cooling. The weight would be about the same as that of a twin of equal power, and the crankcase would be no longer than on a single. It would be adaptable, therefore, to any motorcycle frame, and the twin would not be the only type.

To Leo. J. Egelberg, of La Crosse, Wis., is awarded the first prize, while Harry C. Sundgard, of Frankford, Pa., receives the second.

This series of contests closes with the present issue, and announcement of the final winners will be made in the next issue, that of January 9. Contributors should submit answers to the last question as soon as possible so that the work of judging and awarding prizes may be facilitated. All answers, and communications referring to the contest, should be addressed to: "Editor Questions and Answers, Motorcycle Illustrated, 51 Chambers street, New York."

Below is given question No. 12, that for which answers are now being received. Answers to this question will be published in the January 9 issue with the closing awards.

Question No. 12. How can the proper operation of a battery and coil system be best determined?

CYLINDERS AT AN ANGLE.

(Question No. 11.)

FOR answers submitted to this question, Leo J. Egelberg, of La Crosse, Wis., has been awarded the first prize, and Harry C. Sundgard, of Frankford, Pa., the second. Egelberg's answer was as follows:

"Practically all two-cylinder engines designed for motorcycle propulsion are of the V-shaped type, having the cylinders fitted to the crankcase at various angles with each other, usually 42, 45, 50 and 90 degrees. In view of the general adoption of this type of engine, it is reasonable to assume that such construction offers advantages not obtained with any other in use today.

"Of these advantages, the most important would seem to be the considerable reduction in engine weight and the compactness of design obtained. This practice of placing two cylinders directly opposite and at an angle with each other is noticeable in aviation work, where weight reduction is an important factor. The V-shaped twin permits the working of two cylinders on one throw of the crankshaft, and the size and weight of the shaft and crankcase are practically no greater than in a single cylinder motor and considerably less than in any other type of two-cylinder engine.

"Considering the question of appearance, this type unquestionably is capable of producing a very pleasing effect, lending itself perfectly to the form of frames in general use. The design is neat and at the same time one that utilizes space to the best advantage.

"The type under discussion admits of much simplicity in transmitting the power to the

rear wheel. The crankshaft being placed crosswise in the frame, no bevel nor worm gears are necessary; the drive is a line one. An important viewpoint on the part of the manufacturer is the absence of complication where both single and twin motors are built in the same factory, this being due to the great similarity of the two types. As regards mechanical and explosion balance, the V-shaped twin is not equal to any other two-cylinder types, but this is not a very serious argument against it in view of its superior qualities."

Sundgard's Answer.

Sundgard's answer follows: "The requirements of the motorcycle are such that the power plant must be as light as possible and occupy the least amount of space. Now, suppose we consider the various arrangements possible for a twin motor. First, the cylinders could be opposed. The weight would be about the same as the present type of twin, but the engine would be too long to be accommodated on a motorcycle without making the machine either too long, or the center of gravity too high. Second, the cylinders could be set upright on the ordinary barrel type of crankcase and with a two throw crankshaft. With this arrangement we encounter, first of all, transmission complications. Obviously the motor must be set so its length lies with the length of the machine. This puts the direction of rotation of the crankshaft across the machine and necessitates an angle drive, which adds to the cost of manufacture. Again, we have the added weight of the longer crankcase, two throw crank and long cam shaft,

besides the weight of the more complicated transmission.

"We have remaining but one arrangement, that is with the cylinders set at an angle. Here the direction of rotation of the crank corresponds with the length of the machine. Transmission is accomplished either by belt or chain with a minimum of weight and great directness. Practically the only added weight over the single cylinder type is the extra cylinder, piston and connecting rod. The crankshaft is only slightly heavier than for the single and the crankcase weighs about the same. Finally, I firmly believe that with the direction of rotation across the machine the vibration is felt more. I think that the smooth and easy running of the angle twin is due largely to its direction of rotation."

THE SPARKING POINT

CHAS. KAPPLER.—The explosion of the charge should take full effect exactly on dead center no matter what the speed of the motor. As it takes a relatively long time between the instant that the spark occurs and that when the charge explodes the instant of the passing of the spark has to be "advanced" to compensate for this loss of time, and the faster the motor runs, the greater must be the advance. The longer the time taken between the spark-instant, as it is called, and the explosion-instant, the greater must be the "retard" for starting. On a magneto-ignited motor, turn the crank-shaft over until the piston is between $\frac{3}{8}$ and $\frac{11}{16}$ of an inch before reaching upper dead center finishing the compression stroke, with the contact-maker cas-

FRANK

MERRITT

ing in maximum advance position. The contact-points will at that instant be about to separate, and the motor will be timed properly for ignition. The exact distance *before* dead center depends on the motor itself. With a battery machine on the one hand, the piston should be brought to firing dead center with the cam just about to "wipe" the point on the trembler-blade, the distance between the point when it wipes and the point when the motor is on dead center varying between $\frac{1}{4}$ and $\frac{1}{64}$ of an inch, depending on the motor. The less the distance, the greater range of advance obtainable, and the greater the speed of the motor.

A complete work on motorcycle repairs, which includes actual rebuilding of the machine, is probably not yet published, and may never be. We refer you to the *Motorcycle Manual*.

MOTOR WILL NOT RUN FAST.

J. E. DONALDSON.—There are a variety of causes to any or all of which might be due the troubles you mention. We think that wrong carbureter adjustment is responsible for at least a good part. As you do not state the make of motor and carbureter, we can only give general directions for re-setting. Having assured yourself that the slots in the piston rings are not in line and that compression is good by standing on the pedals, place the motor on the stand and screw down the needle-valve. Adjust the tension of the auxiliary air-valve spring by means of its knob or nut until it just seats. Next open the needle-valve about one and one-quarter turns, put in the switch-plug and pedal the motor over. When it fires and runs gradually reduce the opening of the needle-valve and increase the tension on the auxiliary air-valve spring until the motor runs slowly and shows power. It is advisable to remove the exhaust pipe and note the color of the exhaust, the only sure method of determining the proper mixture yet discovered. For slow speed this color will be a *dark blue verging on violet*. When such color is attained the carbureter is set for slow speed. Keeping the spark well advanced, give throttle until a high speed is attained. The blue tone should still be in the exhaust, but it should be lighter as the speed rises. If the carbureter has a high-speed adjustment set this adjustment till the motor runs at the speed desired. If the auxiliary air-valve is not working properly, the color of the mixture will be red, indicating too much gasoline, or yellow, showing too little and there will be a falling off in power. Next start off on the road, running at slow speed and getting the dark blue exhaust color, and then gradually opening the throttle until as high a speed as desired is reached, making the high-speed adjustment as before. Avoid any changes in color away from the blue. Directions which are more specific will be found in the *Motorcycle Manual*, page 23, and it would be well to read page 9 also.

Above all things, use the spark and throttle intelligently. Make all advances and retards gradually; don't "dump" the throttle into the motor. It will only choke it up, you will not start off any sooner and will have trouble later on in getting it to go at all. Take your time in changing pace. The itching desire to jump away quickly puts money in the repairman's pocket as much as any thing that the rider can do to his mount.

A hot crankcase may be due to leakage past the piston rings, the slots being in line. Broken rings will also give the same results. We refer you also to the *Manual* for advice on this subject.

WHAT TO START WITH.

W. F., JR.—Start your motorcycling career with a single, say of five horsepower. You are not "going where the crowd goes" in getting the one-lunger, but as you are going to do the riding and foot the bills, learn on the single. With a tandem attachment you can take a lightweight passenger almost anywhere within reason on Long Island, Eastern New Jersey, and as far up the State as Peekskill. You will, of course, find a number of hills that will necessitate the passenger dismounting, but you need not hunt them out. By gearing down a bit, you can take any grade you meet, riding solo. Of course your speed on the level will be cut down in that case, but as you are not a road-burner by instinct, this will not be of great moment.

A twin machine weighs at least the amount due to the second cylinder with its connecting-rod, piston, and valve gearing more than the single. As to its slow running, the twin, in the hands of most riders, can be run slower than the single. This is due to there being one explosion per revolution of the flywheels instead of only one per *two* revolutions in the single. With some of the new singles, however, as slow a pace as is desired can be had.

Amos Shirley is located at Eighth avenue, near 56th street, New York City. For R-S machines, the agent in New York is the Riverside Motorcycle Garage, 533 West 110th street. F. A. Baker, the Indian agent, is located at Broadway and 75th street.

KNIGHT-BECKET.

ERNEST J. KNIGHT and Miss Agnes Becket, of Aurora, Ill., will be married on January 1. Mr. Knight is well known as the general sales manager of the Aurora Automatic Machinery Company, makers of Thor motorcycles, and Miss Becket is popular in Aurora social circles.

RAILROAD MOTORCYCLE.

D. R. E. DOZIER.—Your inquiry about a light motorcycle car to be run on a standard 4 feet 8½ inch gauge railroad track

brings up the question of a class of vehicles not yet well developed. There are a number of gasoline-motor hand-cars and light inspection cars, but all of them require the services of at least two men to remove them from the rails. Something in the line of a velocipede would be a one-man vehicle, but with the bicycle part fitted with a motor we doubt whether anything as light has been produced. If you will communicate with Fairbanks, Morse & Co., Wabash avenue, Chicago; the Sheffield Velocipede Car Co., Three Rivers, Mich., or the Buda Co., Harvey, Ill., you will perhaps get some idea of the motor-velocipede. Some years ago there used to be an attachment whereby a push bike could run on a standard gauge track; probably one of the firms mentioned will list it or will know of it.

REMOVING RUST.

A. F. K.—Unless it has eaten too deeply into the plating and stock of the spoke, rust can be removed by the use of kerosene or "Three-in-one" oil, applied with a rag. Aggravated cases can be treated with 00-emery cloth, finishing off with an oily rag. A certain amount of the plating comes away with the rust, and this leaves a weak spot, which soon shows rust again. A brother rider has protected his spokes after rust was removed with "Voltite," a solution applied with a wetted rag, and has had pretty fair success with it. Most of the nickel polishes on the market will remove rust. Rust-removers in general contain an acid or other substance which thoroughly removes the oxide, but which also does away with the plating or skin of the spoke. We recommend the rag and kerosene method as the most suitable from all points of view.

FOREIGN LIGHTWEIGHTS.

C. ANUCK.—The lightweight motorcycle is essentially a European machine. The power varies from $1\frac{1}{4}$ to $3\frac{1}{2}$ horse, the latter being made in twin models only in this class. About $2\frac{1}{2}$ h. is the average. The René Gillet machines used in competition were medium weights, and are sold from 10 villa Collet, Paris (14 me.). It is doubtful whether you could get duplicates. The Lourquin-Coudert machines are to be had at 19 rue Planchet, Paris.

ELECTRIC LIGHTING.

A. MESSMAHL.—The Willard Storage Battery Company's address is Marquette road, Cleveland, O. Write them for further details as to costs, etc. William Hetherington is an electric engineer and is deeply interested in electric lighting for motorcycles. His address is 417 Ridgewood avenue, Brooklyn, N. Y.

STORAGE BATTERIES USED.

H. C. WALTHAM.—See the answers to H. De Lander (Nov. 28 issue) and A. Messmahl, in this issue. Storage batteries are used for electric lighting almost invariably, as there appears to be no satisfactory generator for use on the two-wheeler at present. Dry cells are sometimes used for small lights, but we cannot recommend them.

A SPECIAL racing committee of the Auto-Cycle Union, of England, has just decided that a half mile is not to be considered a distance for recognized record-making. An English rider put in a claim for such a record.

INDIAN FLYING SQUAD.

WHEN the traveling staff of The Hendee Manufacturing Company assembled at the factory for orders for the 1913 campaign, prior to returning to the front, there was organized from it a special corps known as the "Flying Squad," to operate in the

South. With the opening of the new Southern Indian branch at Atlanta, serving the solid South, intensive development of this fertile territory was decided on, and accordingly the forces in the field were massed in Dixie to insure a thorough execution of war plans.

Composing the "Flying Squad" are: F.

L. Hunt, F. D. Shomo, A. Zimmerman, W. J. Teubner, Wilmer Reichert and H. M. Seibold. All available members of this corps were conscripted for the accompanying photograph of a portion of the sales organization after a convention session at the factory.

HELPING THE DEALER.

FOLLOWING up its lively campaign to assist motorcycle dealers throughout the country, the National Motorcycle Dealers' Information Bureau, with headquarters at Indianapolis, is sending out a number of sprightly circulars and other helpful literature. One attractive folder is headed "Five Ways to Make a Noise." It calls the dealer's attention to the value of display advertising, of reading notices in local newspapers, of window displays, of systematic circularizing by mail, and of persistently "talking motorcycles." There is something of value for every dealer—the beginner as well as the veteran—in the latest batch of rapid-fire suggestions from the Information Bureau, and the material will be forwarded promptly upon receipt of a postal.

AJAX-GRIEB ADDITION

WILLIAM R. GRIEB, president of the Ajax-Grieb Rubber Company, Trenton, N. J., believes the new addition to the plant, consisting of a three-story building, which will increase the company's manufacturing capacity by 36,000 square feet, will be ready at the end of this month, and will enable full advantage to be taken of the extraordinary demand for the firm's products. The additional plant has been rendered necessary by the fact that although Ajax business increased 15 per cent. this year as against 1911, despite a reduction in price units of approximately 25 per cent., the company was quite unable to cope with the demand for pneumatic tires. The factory has been going 24 hours per day since February, 1911, is still doing so, and seemingly will go on with day and night shifts indefinitely.

MORE TERRITORY.

PUTNAM COUNTY, N. Y., has been added to the territory of the Ford Motorcycle & Auto Supply Company, of White Plains, N. Y. Last year the company sold the Excelsior in Westchester County only.

ANNOUNCEMENT is made of the resignation of R. M. Hawkins, assistant purchasing agent of the Standard Welding Company, of Cleveland.

CONTINENTAL WARNING.

NOTICE has been served on all tire manufacturers by the Continental Rubber Works that steps will be taken to prosecute firms failing to respect its trade-mark, made up of knurling or indentations, in the form of zig-zag lines, that have served as a distinguishing mark on Continental tires for years past. When the company entered upon the manufacture of its first bicycle tires the mark was adopted, and an application was made to have it registered as a trade-mark on May 4, 1911. The Patent Office registered the mark on December 3 last, and the Continental company is now in a position to take action against other manufacturers who may continue to use the mark on their tires.

YALE SQUAD DIVIDED.

SO successful was the work of the Yale "Flying Squad" in Ohio, that the riders are to continue their work in other territory and one detachment, headed by Harry Capron, has left Toledo on an eastern invasion. They will cover New York State first and then move north through the New England section. The photo shows a Yale demonstration stunt.

CAMPBELL BRANCHES.

ANNOUNCEMENT is made by G. W. Campbell & Co., of Waterloo, Iowa, that they will within the next few weeks open branches in Charles City, New Hampton and Vinton, Iowa. Guy Campbell, president and general manager of the company, has just obtained a lease on a large store in Charles City and expects to have it open for business by January 1. Fred Campbell, who has been in the employ of the company for some time, will have charge of the new branch, which will control Butler, Michael and Floyd Counties, and portions of Chickasaw and Cerro Gordo. The Campbell company handles a general line of sporting goods and is agent for Indian motorcycles. It disposed of three hundred machines last year and has booked orders for 500 thus far for the new season.

BAKER EXPANSION.

F. A. BAKER & CO., 10 Warren street, New York City, for ten years distributors of Indian motorcycles in Greater New York, is making preparations for a big expansion for 1913, and with this in view a new uptown branch will be opened January 1, at 208-210-212 West Seventy-fifth street, near Broadway. The uptown branch will be equipped with a complete repair shop, in charge of a competent mechanic.

A special offer of free motorcycle storage will be made to residents of New York City purchasing new 1913 models. Indian motorcycles only will be sold.

There will also be a general garage business for the accommodation of motorcycle tourists visiting New York. A full line of Indian parts, motorcycle accessories, clothing, etc., will be carried in stock, both at the uptown and downtown stores. The Indian agency in Brooklyn, controlled by A. H. Patterson, is located at 1080-82 Bedford avenue, will be similarly equipped to the New York store. The downtown store at 10 Warren street will have general supervision and will be the main distributing headquarters.

Dr. T. J. Foster, a veterinary surgeon at Monticello, Ind., uses a motorcycle in responding to calls.

TIPS *And* TOPICS

BIG twins will be featured for 1913," say quite a few makers and garage-men. They intimate that the 8-10 h. twin will no longer be looked upon as a speed-monster, and that we may expect to see "Dad" taking out three of his girls in a special sidecar fitted to carry the extra passengers. The writer sometimes wonders how much power we are eventually going to find in twins. Are we going to travel along the lines of the automobilists, who not so many years ago considered that a runabout should be fitted with a 50 h. motor, or is it going to be a case of 14-16 h. twins for solo work in the near future? The motorcycle industry has followed the course taken by the automobile trade very closely since it first assumed respectable proportions, and it may emulate the "big car" craze of 1907-10 with a "monster-twin" mania in 1914. Let us hope not, for the sake of the hospital statistics, if not for the good of the sport.

Twins and Twins.

SPEAKING of big twins, we all hear of poor roads in the West and of how riders of 7 h. mounts have had great trouble negotiating them. I have ridden both singles and twins myself, but the experiences of a friend, just returned from the Rand in South Africa, throws new light on the twin (and horsepower) question. Just before leaving for London he took a holiday trip of 375 miles across the veldt, and rode over only 67 miles of "road" during the entire distance. The remainder was foot-tracks, prairie and fords, with an occasional descent to cross a *sluit* (arroyo or deep gully). He had some photographs taken on the trip, showing the country crossed; one of these was a ford where three husky natives were carrying him and his bus over four feet of water. When I told him about the gumbo here he smiled, and concerning the big twins his remark was: "Fancy carrying 300 pounds across a *sluit*." He told me in confidence that a 4 h. single for such work was out of the question, being too bulky for use on the velt, and that the best all-around mount was a 2¾-twin, with foot-rests, the type that he had made the 375-mile trip on. And this in a country where our wallows would be considered wagon roads, and where 13 inches clearance on automobiles is desirable for fear the fly-wheel will smash on a rock. In one or two of my friend's pictures, the mud was up to the foot-rests and resembled our own precious gumbo in consistency.

THE twin mentioned has been pretty often described by "Britisher" and has its cylinders opposed horizontally, the bore

and stroke being 2.36 inches each. One wrinkle in construction worth copying is a pressed-steel outside flywheel and the motor gives one explosion every revolution at equal intervals. It has a peculiar oiling device, a combination of hand and pressure feed to the crankcase. When the rider pulls the pump plunger up, oil is taken into the barrel from the tank, and a spring then forces the plunger down, the oil going through a sight-feed device by means of which its flow is regulated. I like this idea better than the gravity drip arrangement, but do not think it is anywhere near as desirable as the apparatus I looked over on an old 3 h. single bike the other day.

Novel Oiling System.

WHAT first attracted my notice was a triangular well in the bottom of the crankcase. Next I saw three leads, one to the rear wall of the cylinder and the others to the pulley and valve sides. There was a mechanical pump and also a hand-pump on the tank, and a pipe from the latter to a three-way connection attached to the leads. The owner showed me that there were three oiling systems in one on his 'bus. In the first, the mechanical pump fed oil through the leads, and this oil passed through channels in the shafts, whence it dripped back into the triangular well where a siphon tube drew it out at intervals and sent it over the chain. Should the mechanical pump go bad, all that was necessary was to open a cock and use the hand pump at regular intervals. This was the second system. The hand-pump was also used for such speed work as the rider did when the mechanical pump did not flow enough oil. Both of these systems did not recirculate the oil, but after it was used in the bearings applied it to the chain, and there was no splash. The third system was by splash, the crankcase being filled to the proper height through a breather which was plugged when the siphon tube was used, while the latter tube in this system is plugged and the breather left open. This is the emergency system, and so far has not been used by the rider except when he first bought the bus. Some such arrangement as his ought to be on every motorcycle pretty soon.

Circulation Oiling.

I WAS talking about this system with a rider shortly before the Editor let out a howl for my manuscript, and he seemed to think the circulation system is better. (He rides a machine with this system of lubrication.) I think most of us know how the circulation apparatus works, but not very many have examined the oil after it

has gone the rounds a few times. To cut a long story short, I worked some oil out of his crankcase and after distilling it, showed him some chips and fine powder which remained. Part of this was aluminum, part bronze and some cast iron; all came out of the oil. You can imagine these little chips rubbing on the bearings as the pump passed them through the gutters again and again. No gauze screen is of fine enough mesh to catch all of these particles of metal. This same thing will happen with the systems described in the last instalment of "Britisher's" Notes, the Enfield and W. & D.

Increased Brilliancy.

NOW and then someone announces that if you add this or that to the water in your generator, there will be an increased brilliancy of light, and the generator will not freeze in cold weather. Judging from some of the substances used in the metropolis recently I conclude that Nihilist publications were the authorities from which the information was derived. So long as hydrogen-peroxide was employed in a very weak solution, about 1:25 to 1:50 increased brilliancy and a lower freezing point was obtained with moderate safety, but experiences like the following show that a little knowledge is often dangerous.

In company with a brother rider I was approaching a motorcycle garage when we were hailed to enter and be witnesses of a new mixture for winter use in the generator. We entered and stood at a respectful distance from the experiment. On turning on the "water," the top of the generator opened like a lily and there was a rain of acidulated water and carbide burning with a copper flame. Prompt and liberal use of a chemical extinguisher subdued the conflagration, and on questioning the seeker after new mixtures while applying oil to his burns, we were startled to learn that he had employed the base of a very potent high-explosive for the solution; one that detonates on pressure. He had read about it in a book. A ten-acre lot with a coroner in attendance is recommended as most suitable for these demonstrations; personally we think it advisable to stick to alcohol as a non-freezing solution where human life is precious.

A Criticism.

"TIPSTER" in the last issue seemed to take exception to what was a rather harmless arrangement of motorcycle driven from the sidecar, describing it with a delightful alliterative phrase in which "m" figured prominently. Well, to the rider of a fat-cylindere bus, driving from the sidecar must seem somewhat soft, but it should

be remembered that from such individual arrangements of control and other things in the past came the standard practice of the present, and so it goes always. Not that driving from the sidecar seat is likely to influence the design of motorcycles decidedly in the near future, but it might, indirectly. At present, any motorcycle is rather difficult to make accurate tests on, being a one-man outfit. When a sidecar is fitted two men are needed; one to drive and the other to make the tests. There is too much of a chance of misunderstanding in the latter case, but if one man can sit down alongside the machine and observe it while controlling it a lot more will be known about air-cooled motors. Then there is the case of the man who is incapacitated from riding but who can drive a sidecar outfit; he ought to be considered in the economy of things as well as the highway incinerator. So the desired arrangement might be of some use after all.

Cocked Saddles.

PROBABLY some of you readers will notice that you occasionally cannot ride for the usual length of time without feeling a strain more on one side than on the other. This is often due to the saddle shifting out of level to one side, usually the right, as many riders have a tendency to throw the left leg over to the right to ease themselves. It is an easy matter to glance at the saddle before starting out and note whether it is level or not. Those who have ridden push bikes seem to do this unconsciously before dropping into the motorcycle seat. Around the big cities, cocked saddles are very noticeable, it being rather difficult to get at the clamp bolts, especially with a big wrench, the "boulevardiers" stock tool. It is just about this time of year that the saddle tops are bulged out of shape from careless sitting. If you are getting a 1913 model it may not make so much difference, unless the saddle turns down and dumps you before the new bus arrives.

Care of Lamp Burner

IF your gas is supplied by generator, never let the light go out gradually after the water flow is shut off. A dying acetylene flame carries much soot, which will be deposited in the burner until the tiny holes are completely plugged. Exactly the same thing will happen if you leave the gas from your tank turned very low; for example, when the machine is standing outside waiting for you to finish your call on the young lady. If the flame is kept up to moderate brightness, no soot will form, or at least, not enough to cause trouble.

Should your burner become plugged, the only remedy is to fit a new one or clean the old one, and as cleaning is rather a difficult task in the dark, a prudent rider will carry an extra burner in his kit, thus being ready for the emergency when it arises. The tips are rather brittle, so be careful when screwing one home that you do not wreck it. A coating of white lead or shellac on the threads will prevent any leakage of gas, or even a few turns of soft string before the burner is screwed down tight will often do the trick. Your repair kit should also include a few inches of fine stiff wire, small enough to be pushed through the burner's tiny holes, for cleaning out any particles lodged there. Another good way to clean a burner is to attach it to a pump and force out the obstacle by air pressure.

MUFFLER DESIGNS

BELOW are shown seven designs of silencers found on motorcycles at the recent English Show in Olympia.

(1) Novel silencer on Quadrant twin. (2) B. S. A. muffler system. (3) Silencer and long exhaust pipe on the W. D. (4) Shown on the Levis two-stroke. (5) The Corah design. (6) The Indian muffler, showing cut-out. (7) Triumph's long exhaust pipe with spatulate end.

AN INDIAN POW-WOW.

AN INDIAN pow-wow was conducted recently by the Wisconsin Motorcycle Company, of Milwaukee, by way of celebrating the arrival of the 1913 Indian models. The affair, which included an excellent musical program and an exhibition of articles used by the original red men, such as Indian pottery, war clubs, decorated blankets and scalping knives, was held in the company's salesroom and was well patronized by local motorcyclists.

BOSCH AGENCIES.

FOUR new Bosch agencies are announced as follows: Dallas A. Shafer & Co., 106 North Eighth street, Richmond, Va.; Fry & McGill Motor Supply Company, Denver, Colo.; Pence Automobile Company, 800 Hennepin avenue, Minneapolis, Minn., and the Johnson-Gewinner Company, of 124 Peachtree street, Atlanta, Ga.

ON THE MERKEL LIST

AMONG the agencies recently placed by the Miami Cycle & Mfg. Co., are a number over the Canadian line, as follows: The Dominion Cycle Co., of Winnipeg, Man., renewed its contract and ordered a carload of machines; the contract of the Western Cycle & Motor Co., of Regina, Sask., was also renewed, and Walter Andrews, of Toronto, was signed up as a new representative. He will handle the Flying Merkel line throughout the Province of Ontario. F. L. Valiant, assistant manager of sales at the Miami factory, dropped in at Toronto on a flying trip and closed the deal. Joe Bourne will continue to retail the Merkel in Toronto.

NEW LOCK PRICES.

THE Sabo Manufacturing Company, of Cleveland, O., which recently patented and put on the market the Sabo Motorcycle Lock, has found it necessary to revise its working basis. The cost of manufacturing and advertising the article permitted of no profit at the old rate of \$1. After a careful study of the situation they have appointed the Aermore Manufacturing Company, of Chicago, as sole distributor for their product, and they will devote their entire attention to the manufacturing. The revised prices will be forwarded upon application to the Aermore company, 1536 Michigan boulevard, Chicago.

A NEW ENGLAND DEALER.

H. K. AUSTIN, Eagle agent at Reading, Mass., is one of the New England live wires. Mr. Austin has handled the American Motor company's products for the last six years with great success, and reports the outlook for the coming season far in advance of last year. Mr. Austin is also the manufacturer of the Austin frame pump for bicycles and motorcycles, and does a large business in this line. An order for 5,000 of these pumps has just been placed with him by the American Motor Company.

PHAY SAVED MONEY

L. PHAY, a motorcyclist of Cedar Rapids, Ia., has been riding a Yale single since the summer of 1910, and in the three seasons has covered 25,000 miles. He states that in running up this mileage his total outlay on the machine, aside from gasoline and oil, was \$2.30.

HARRY BEHREND, of Huntington, W. Va., has been appointed State Commissioner by President Patterson.

HALF MILLION DOLLAR PREST-O PLANT

THAT the Prest-O-Lite Company, of Indianapolis, is building a new factory, costing over half a million dollars, and with four times the capacity of the present plant, is ample evidence that the company has strong faith in the continued growth of the gas tank business. Appropriately enough, the new plant stands just across the road from the Indianapolis Motor Speedway, in the construction of which Carl G. Fisher and James A. Allison, president and secretary of the Prest-O-Lite Company, played such important parts.

The new factory is about five miles from the center of the city of Indianapolis,

Ten Buildings Are Under Construction by Prest-O-Lite Company Near Motor Speedway on Out- skirts of Indianapolis.

quarters of an acre floor space; and a model garage for the use of the company's employees; engine and boiler house, and four warehouses constitute the rest of the new Prest-O-Lite plant.

Construction work was begun six months ago, and the company hopes to be in its new quarters by the first of March. A part of the factory, indeed, is already in use. The gen-

erator and charging plants have been running since the middle of October. The other buildings are more than half finished.

Every step in the manufacture of a gas tank will be carried on at the new plant. Manufacturing processes that have been scattered over the city of Indianapolis, and even in other cities, will here be gathered together.

The whole factory has been planned so as to permit the utmost economy of time and labor in handling the product. The sheet steel comes in at one end of the plant, and comes out in finished tanks at the other. No effort or expense has been spared to make the

and is the first of a colony of automobile and accessory factories which, it is planned, shall constitute a "Horseless City" near the famous speedway.

There are ten buildings in the Prest-O-Lite group, occupying fifteen acres of ground. The main factory building, 300 feet by 400, occupies an area nearly equal to a city block. A charging plant (one of sixteen such plants scattered throughout the United States and Canada); a generator house, where the acetylene gas is produced; a big gas-holder of 25,000 cubic feet capacity for storing the gas; a spacious office building having three-

working conditions in factory and office ideal. Liberal use of windows and skylights provides good light and ventilation.

Already plans are under way for the accommodation of employees and their families near the factory. Two railroads, a traction line and an excellent stone boulevard furnish transportation into Indianapolis.

Ten years ago The Prest-O-Lite Company began business in a little concrete block building about twenty feet square. This summer a Canadian factory was opened, and two Canadian branches were installed. The first little Prest-O-Lite factory building is still standing in Indianapolis.

Top of Page, Side View of Office and Factory; Center, Part of Charging Plant; Bottom, View of Entrance to Office.

NEW BUCK CAPITAL.

A NNOUNCEMENT is made by the Buck Sales Co., of St. Louis, Mo., manufacturers of the Simplex sight oil gauge, that H. G. Reid, a St. Louis capitalist, has taken an interest in the company and will hereafter look after the firm's business in foreign territory. Mr. Reid will leave for an extended European trip early in January, and will also visit Australia.

Among the new accessories that the Buck Sales Co., is placing on the market are a new magneto cut-out and a carburetor control, the latter being a device which gives a correct mixture at all speeds. The control is sold under the trade name of the "Auto-Thermos."

NEW MERKELITES

G. W. BROWN, of Denver, Colo., formerly agent for the Flying Merkel, has sold his motorcycle business to O. F. T. Daenitz. Mr. Daenitz has contracted for a carload of Merkels. Other new Merkel agencies are given as follows: W. A. Buff, Pontiso, Ill.; Spahr Brothers, Canal Dover, Ohio; Falls Garage Company, Chargin Falls, Ohio; R. W. Thompson, Tidioute, Pa.; W. B. Apple, Walkerton, Ind.; C. T. Ranere, Hammonton, N. J., and H. E. Linde, Seneca Falls, N. Y.

HIPPO-FRENCHO SALE

HOWARD A. FRENCH & COMPANY, of Baltimore and Washington, have bought out the interests of the Hippo-Frencho Company, manufacturers of the Hippo-Frencho Indian free engine clip, Hippo-Frencho quick detachable Presto tank brackets and the Hippo-Frencho foot rests. In the future these products will be sold by H. A. French & Company, under the name of "Hafco."

L H. MESKER, manager of the St. Louis branch of Manning, Maxwell & Moore, Inc., has resigned his position and will be connected after January 1 with The Ferro Machine & Foundry Co., of Cleveland, Ohio.

**THE CANADIAN WIGWAM.**

ONE of the most important advances made of late by the Hendee Mfg. Co., is the establishment of a Canadian branch in Toronto, Ont. This up-to-date headquarters will handle all the firm's business in the Dominion, and will afford Canadian riders the highly efficient service which patrons of the company throughout the States have come to expect. The new branch, situated at 12-14 Mercer street, is in a four-

story brick structure, so equipped that all branches of work will be facilitated to the utmost.

Edward Buffum, of the sales department at the Springfield factory, has been appointed general manager of the Canadian branch. As a pioneer of the motorcycle industry, possessing a keen insight into the requirements of the trade and riders in general, Mr. Buffum is admirably fitted for blazing new Hendee trails in Dominion territory.

Fitting Improved Corbin-Brown Speedometer

IN addition to showing exceptional strength and simplicity of mechanism the Corbin-

Corbin-Brown Speedometer, Stripped to Show Internal Mechanism.

Brown speedometer for motorcycles, made and marketed by the Corbin Screw Corporation Division, American Hardware Corporation, of New Britain, Conn., possesses another desirable feature. It is calibrated up to 80 miles and can be attached to either the front or rear wheel of the motorcycle without disturbing the wheel adjustment of the machine.

One of the accompanying illustrations shows the front wheel attachment. Absolutely positive recording is assured by the perfect interlocking of the driving sprocket and gear. The large driving sprocket is made in one piece and bolted to outside of spokes with secure clamps. The spring fork is compensated for by a special bracket.

The rear driving attachment is so constructed that the speedometer may be instantly disengaged from the driving sprocket. A slight pull of the cable does it. As a result there need be no recording of mileage while the motor is being tuned up on the stand. The driving sprocket is made in two parts so that it may be slipped into place easily. The Corbin-Brown folks are prepared to fit their instrument to all standard makes of motorcycles, with either front or rear wheel driving.

A LOOPED MUFFLER PIPE.

A FOREIGN exchange illustrates a muffler pipe of flexible metallic tubing which makes six fairly large loops, under and slightly forward of the motor, before leading to the rear. It is credited with an unusual cooling effect upon the exhaust gases.

Members of the Bay City M. C. recently moved to their new club rooms on Fifth avenue.

R. E. ULLMAN, of Ironton, Ohio, reports the loss of his 1911, 7 h. Indian. The frame was red with blue motorbase and the motor number was 73 C 099.

Corbin-Brown Front Wheel Fitting.

68 Miles an Hour

FRANK LIGHTNER'S stock 8 H.P. Harley-Davidson twin attained a speed of 68 miles per hour in the Bakersfield road race held at Bakersfield, California, Thanksgiving Day. P. C. Taylor's single cylinder Harley-Davidson won the single class, finishing 49 seconds ahead of James Dupes on another Harley-Davidson, and over an hour ahead of the nearest machine of another make.

Harley-Davidsons are not racing machines, but because they are designed right and built right they will outrun any other stock machine of equal horsepower or equal piston displacement.

The 1913 Harley-Davidson twin is the fastest stock motorcycle built, barring none, and to our knowledge has not been defeated in any contest which it has entered to date.

How Far Can You See at Night?

Do you slowly creep along—seeing a few feet ahead of you, by means of a feeble oil lamp or small carbide generator—or do you ride along at a good speed with a flood of Prest-O-Lite brilliancy telling you of coming ruts and puddles IN PLENTY OF TIME to avoid them?

The pleasure of night riding is made possible ONLY by Prest-O-Lite—the practical light for motorcycles.

Turn on just like a gas jet and touch a match. Convenient, clean, dependable. Nothing to freeze in cold weather.

Gives you a steady flood of bright light that neither flares up or dies down. Insure yourself and your mount against accidents. It is, in every way, the only economical kind of light.

Prest-O-Lite For Motorcycles

Exchange service practically everywhere has been provided for you through our 20,000 dealers (automobile and motorcycle).

NOT AT ALL Expensive

Any rider who has used Prest-O-Lite will tell you that the operating expense of it is no greater than the cost of the carbide a generator consumes.

The first cost, \$10, does not represent money spent, but INVESTED, because the genuine Prest-O-Lite is always in demand and is always salable for about its first cost.

Therefore you can easily afford it—in fact, you cannot afford to be without this combined Convenience, Pleasure and Insurance. One accident due to poor light may cost you more than years of Prest-O-Lite service.

Prest-O-Lite Owners

Louis F. Bradburn, 45 Chapel Street, Canandaigua, N. Y., agent for the Harley-Davidson in his locality, finds Prest-O-Lite the only safe light for night riding.

Price, \$10

(Equipped with Gauge)

Dimensions: Length, 13 1/4 inches; diameter, 4 inches; weight, 8 1/2 pounds.

Don't Let Anyone Cheat You With an Imitation

The genuine Prest-O-Lite, when empty, can be immediately exchanged for a full one ANYWHERE and ALWAYS. Imitations can not.

The dealer who slips on a counterfeit in exchange for your Prest-O-Lite gets the best of you. Don't let him!

Protect yourself by accepting only tanks filled by the Prest-O-Lite Company. Look for our name.

The Prest-O-Lite Co. 246 East South St. INDIANAPOLIS, IND.

CANADIAN GENERAL OFFICE AND FACTORY, MERRITTON, ONT.

Branch offices in all principal cities. Charging plants in all parts of the country. Extensive foreign service.

EXCHANGE AGENCIES EVERYWHERE

Mr. Dealer: Get into the habit of talking to your customer about Prest-O-Lite. A simple statement of the facts about this light will make sales.

And, if you want to retain your customer's trade on other things, don't get him into the habit of going elsewhere for his Prest-O-Lite exchange.

Start Your Engine Easily Even on the Coldest Day

When you have the proper amount of oil in your engine you can start and pedal with the utmost ease. Even on the coldest day.

Only with the Simplex Oil Gauge can you tell the exact amount of oil that is in your engine.

Fits all machines that have no oil gauge on the crankcase. Easily attached in a few minutes. Riders often ruin their engine cylinder because of insufficient oil. With the Simplex you can run thousands of miles without taking down your engine to remove carbon, because it keeps oil at the right level.

THE SIMPLEX OIL GAUGE.
"In sight and out of the way."

The Simplex is handsomely nickelplated—a little larger than a silver dollar and is only $\frac{3}{16}$ " thick.

The Simplex keeps clean. It prevents your plugs from fouling—saves its cost in oil in a few weeks.

Fits Harley-Davidson, Excelsior, Thor, Flanders, Etc.

Order One Today—\$1.50, Postpaid.

Without any obligation or charge on your part, you can try the Simplex Oil Gauge for 30 days. If it is not O. K. you can return it and your money will be refunded. Nothing could be more fair.

Order today. Mention your dealer and name of machine. Circular free.

Keep your feet always on the Pedals

The deep rubber corrugations in the big cushions on

STANDARD PEDALS

keep the feet in the proper position. When going over rough roads, the constant jarring and bumping makes it very uncomfortable for the rider who cannot make his feet stay "put"—not to mention the fact that he cannot readily use his brake.

STANDARD PEDALS insure the utmost comfort for the feet. They have been in consistent use by the majority of motorcycle manufacturers for many years, and you can have them on your motorcycle if you insist on Standard Pedals.

Dealers—send for electrotypes and description of our line. It is well worth handling.

THE STANDARD COMPANY
TORRINGTON, CONN.

1913 Agencies Open

Our factory facilities have been increased so that now we can care for many times the business we had in 1912. Those dealers, as our competitors, who were disappointed in the machines they sold should look into the merits of the

JEFFERSON

The 1913 Models are marvels of mechanical perfection—and any dealer will be proud to sell them. In this small space we can't tell of the features of these new machines, but if you are interested write today for specifications and dealers' special proposition for 1913.

WAVERLEY MFG. CO., Waverley Pl., JEFFERSON, WIS.

Dealers! Riders!

Here's the ideal luggage carrier. Built scientifically—can withstand considerably over two hundred pounds weight. Just the thing for tandem riding. Adjustable to all motorcycles.

The "Star" Luggage Carrier

is sold by the leading jobbers in the country. Write for our catalog.

"A FEW CENTS IN THE LOCK IS WORTH FIFTY IN THE REWARD"

"Motorcyclist's Book of Proverbs"

¶ Keep your name off the list of "Stolen Motorcycles." Almost daily you see mention of another machine stolen. Laws against motorcycle thieves are weak and the only way to thoroughly protect yourself is by locking your machine so it cannot be moved except by YOU—and the only lock that prevents machine being moved and that cannot be picked, pried or cut, is the "SABO."

¶ You can safely leave your motorcycle anywhere if you have a Sabo lock. It fits tight to the frame—cannot be pried off—there are no chains to be cut by pliers. You've got the goat of every motorcycling "Jimmy Valentine" that wants a ride on your gasoline. The lock is scarcely noticeable. The would-be thief will perhaps not see it; will walk up to the machine acting as if it were his own. But when he tries to move it from the stand he'll learn "Sabo's on the Job."

¶ It's made of bronze metal, neat, simple, strong—fits your smallest pocket—lasts forever. The stand is locked securely to the frame—the machine cannot be moved while the lock is there—no danger of breaking spokes or chain by forgetting the lock and pushing machine from stand. It is impossible to wheel or ride the machine away.

¶ We prefer to have you buy from your dealer, but, if he does not have it, send this order blank with \$1.25 and the lock will come back to you, satisfaction guaranteed, prepaid, by return mail.

JOBBERS

List this in your 1913 Catalog. Cuts, literature and advertising matter furnished. Write for proposition.

Brown Scientific Non-Deflating Pneumatic Tube

AN AIR-FILLED MOTORCYCLE TUBE POSSESSING VERY UNUSUAL FEATURES:

- First: It withstands a tread puncture without deflating the tube.
- Second: The higher the pressure the tighter the puncture closes.
- Third: It eliminates the risk of destroying casings by reason of punctures.
- Fourth: The danger of loss of control of machine is removed.
- Fifth: It assures you of not being obliged to repair a puncture on the road and gets you "there and back" on full tires.

AIR FILLED ONLY.

Punctures are self-closing by reason of a scientific but simple principle of construction.

NO "DOPE," GUM, PASTE OR OTHER STUFFING MATERIALS.

Write for prices, full description and sectional sample.

Your Motorcycle

should be equipped with chains that will stand up under all conditions. You can depend upon the "Whitney" Chain whether in rain, mud, sleet or snow; they are always on the job. They give the maximum amount of service because they are made by men with years of experience in chain making.

When making replacements insist on a "Whitney."

*"Whitney" Chains
Are Built for Strains*

The Whitney Mfg. Co.
HARTFORD, CONN.

Motorcycle Valve Stems

get the hardest use of any gas engine valve. The problem is to make them so they will not break or burn up.

By using the toughest steel, properly heat treated, we overcome the breaking, and by welding a cast iron seat to the head we eliminate the pitting, burning and warping.

Long service in the most popular machines has proven these things.

If you are not using them, will you go into the matter with us?

Motors DeLuxe

Superiority Wins! Ten months ago we announced to the trade for the first time our now famous line of DeLuxe Motorcycle Motors. Today many prominent motorcycle manufacturers are using DeLuxe motors and they are the most talked of sensation of the present season.

Why?

Because of the following noteworthy features, some of which are:

- Rigid Crankshaft.
- One Part Crank Case with Cover.
- Improved Cam and Magneto Drive.
- Oil Tight Motor.
- Positive Oiling System.
- Silent Operation.
- Simplified Design Throughout.
- Reduced Number of Parts.
- High Power Development.

FOUR SIZES

- 4 H.P. Single Cyl.
- 5 H.P. Single Cyl.
- 7 H.P. Twin Cyl.
- 9 H.P. Twin Special

1913 Will Be a DeLuxe Year

Motorcycle Manufacturers, place yourselves in a position to supply the certain demand.

A Porcelain Motorcycle Spark Plug!

Made for Motorcycle Service Only

No need any longer to use the inferior mica plug or a makeshift porcelain. This new Motorcycle Standard Spark Plug, built by the greatest manufacturer of spark plugs in the world, gives motorcycle riders a plug with a porcelain insulator that is faultless, defies heat and insures perfect ignition.

\$1.00

Motorcycle Standard Spark Plug

Leading motorcycle engineers of the country have pronounced this plug right in principle and construction. The length over all is 2 1/4"—just the right size for the limited dimensions available for a spark plug in the motorcycle motor. The porcelain is made in our own potteries. Heat cannot crack it. The bushings are case hardened. The terminal nut will take ordinary wire, ring, or special "Indian" terminal.

Comes in half-inch or metric sizes. Your dealer will supply you—or sent prepaid on receipt of price and size.

PRICE—\$1.00 per plug

Our guarantee—"Your money back or a new plug, unless you are absolutely satisfied."

JEFFERY-DEWITT COMPANY

55 Butler Ave.

Detroit, Mich.

Mott Rims for Strength

THE superiority of the Mott motorcycle rim lies in the little points that the average riders never notice, but that show up strongly in hard service. For instance, take the way the spoke holes are punched. On Mott rims this is carefully and accurately done so that there is ample strength to hold the nipple securely. Sketch No. 1 shows the idea. Most other rims come out like No. 2. This part of the work is hurried over, carelessly done, and as a result the holes are counterpunched too deep, making a weak spot, which often allows the nipples to pull through the rim.

Mott thoroughness shows up in the tests. Note the wheels that come through the severe endurance runs in the best condition. You'll find them fitted with Mott rims. To be sure of satisfaction, specify Mott rims for your machine.

SPEED With Economy

The M&M requires a 1/4" pipe tap to insert into manifold. It is made with six portholes, which when open, admits auxiliary air into the manifold.

The M&M Economizer will save you from 40 to 50% of gasoline, and will give you 20% more speed and power with less gasoline and less carbon.

It is the only known carburetor adjuster on the market. Do not throw your old carburetor away, before you have tried our device. **THEN NOTICE RESULTS.**

It is great for priming the engine. When going down grades, it cuts off all gasoline and ignition.

PRICE \$1.25 PREPAID.

The M&M is a nickel-plated device, highly polished, and it is positively air-tight when closed.

Guaranteed to give satisfactory results.
Money refunded in 30 days if unsatisfactory.

"All The Power Without The Jerk"

Combine tremendous strength, absence of stretching, with durability and that flexibility so desirable in a motorcycle transmission, and you are assured perfect transmission service. Smooth, easy, non-jarring riding is possible with the SPARTAN BELT.

There must be some good reason why 90% of the belt-driven motorcycles are equipped with SPARTAN BELTS. The secret lies in our method of tannage. By this process every SPARTAN BELT is given an "immunity bath" and is proof against all weather conditions.

No heat, cold, water or other element can cause the

SPARTAN

Belt to lose its flexible, powerful efficiency.

If comfort, convenience, strength, long life, simplicity and silence hold any weight with you in the selection of a transmission, then

Spartan Belts

have gained still another firm adherent.

We wish to extend to all our friends our most cordial holiday greetings and best wishes for a bright New Year.

Conclusive Proof that this is
the ideal Tourist's Motorcycle—

The *Indian*
Motocycle

Of the hundreds of motorcyclists who took part in the four F. A. M. tours to Columbus, Ohio, last week, no less than 70 per cent. were riding Indians.

When you are familiar with the Indian Motocycle's illustrious record, it is easy to understand its popularity.

"Count the Indians on the Road!"

In the racing contests at Columbus, the Indian Motocycle made a clean sweep of all F. A. M. Championships, *amateur and professional*.

Over 16,500 Indians of the 1912 Model are now on the road

Goodyear Motorcycle Tires Make Another Killing at Columbus

At The Largest And Best Motor- Their Splendid Speed And Reliability.
cycle Track In The World, These Goodyear Machine Made Motorcycle
Durable Tires Dazzle All With Tires Prove Superior At Every Turn.

Never before in the history of tiredom has a single make of motorcycle tire captured so many honors and so indisputably proved the claims of its makers as did the Goodyear at the F. A. M. Meet, Columbus, from the 18th to the 21st.

Previous to these events every world's speed record, both amateur and professional, was held by Goodyear motorcycle tires. Men have come to look upon these as the winning tires—tires that never fail to render the service demanded.

Note in the bulletin below how these winning tires swept all before them in the Columbus Races.

BUILT ON TIRE MACHINES.

The unequalled quality of Goodyear tires is due to the manner in which they are constructed. Thirteen years of No-Rim-Cut auto tire experience is back of them.

The Goodyear tire machine, one of the evolutions of these thirteen years of experience, is responsible for the durability of these tires.

This machine abolishes the possibility of flaws that are bound to creep into the common tire—the tire that is stretched by hand.

For this machine stretches on every layer of fabric with absolute **uniformity of tension**. No matter how big or little, strong or tired the operator is, this machine does its work without the slightest variation.

The result is a tire that the world recognizes today as being the leader—

A tire that holds every world's record for speed, and a tire which, in countless tests, has proved to be the most durable motorcycle tire in existence; a tire that reduces the danger of punctures and blow-outs, that minimizes tire cost, that affords riders the very maximum of service at the price they pay for common tires.

Because of the unequalled durability of Goodyear Motorcycle tires, every motorcycle manufacturer in the country has made contract for, and is recommending our tires wherever possible.

GET OUR BOOK ON MOTORCYCLE TIRES

An interesting booklet on motorcycle tires is yours on request. It is full of information that every motorcycle rider should have. Send for it at once.

BULLETIN OF COLUMBUS MEET

Columbus, July 21.—National F. A. M. Amateur Championship won by Constant, receiving Bosch Trophy. Seymour broke 3-mile record in 1:56; fastest rider in America. Every race at Columbus was won on Goodyear tires, twenty-one in all.

The Most Popular Motorcycle
for Public Service—

The *Indian*
Motorcycle

The Indian has been for many years the favorite machine for use in the service of the public. Over 200 public service bodies now patronize the Indian exclusively. This is not counting the many telephone and electric companies, gas companies, etc., which equip their men with Indians.

Philadelphia, Pa., has recently ordered 50 additional twin cylinder 1912 model Indians for their motorcycle squad equipment. They have been using the Indian for the past six years exclusively.

Over 17,000 Indians of the 1912 Model are now on the road

Let Motorcycle Riders Answer These Questions on Tires

The oldest and most experienced and most successful motorcycle riders, both of endurance and race track fame, use Goodyear Motorcycle Tires. Why is it?

Every amateur and professional world's record is held by these tires. Why is it?

Goodyear Motorcycle Tires have won and to-

One or two victories on the race track do not establish the speed supremacy of tires. Neither do one or two endurance runs with a wonderful show of mileage, point to anything definite as regards durability. It is the perpetual performance of the tire that counts.

There can be no coincidence, no mere good luck when a tire continuously wins everything in sight; nor in a tire that continuously renders more mileage than all other tires—as do Goodyears. It is in these daily performances that you find the unquestionable proof of highest quality.

Because of these performances, now known to all the riders of the single-tracker, every other motorcycle will be equipped with Goodyear Tires next year.

day holds contracts from every motorcycle manufacturer—Why is it?

Goodyear Motorcycle Tires hold not only a speed records but they also hold the record for durability. Countless tests prove them the most durable tires in existence. Why is that?

The answer solves the question of real tire service.

And riders will save an endless amount of trouble and expense as a result. Their tire troubles will be practically ended.

Made by Makers of No-Rim-Cuts

Men now admit that the No-Rim-Cut is the kind of auto tires. Over 1,400,000 of these tires have been used. There has been plenty of chance for comparison. Results have proved their superiority.

Goodyear Motorcycle Tires, designed for ordinary road use as well as for racing, are built under the same roof and by the same makers as No-Rim-Cuts.

Is it any wonder that these motorcycle tires have gained precedence over all others?

Built on Goodyear Tire Machines

The Goodyear Tire Machine is an evolution of our thirteen years tire making experience. Unlike the hand method commonly used, this machine stretches on each ply of the tire fabric with an absolutely uniform tension.

So unlike the hand-stretched tires there can be no too-loose or too-tight plies to break down and cause blow-outs, in a Goodyear Tire. Durability is no longer a matter of guess work. With Goodyears it is a matter of science.

This is but one of many ways we take to build excellence into Goodyear Motorcycle Tires. The most durable tires in existence, yet they cost no more than any standard tire.

Why don't you begin today investigating Goodyear tires—tires that render most service at least cost?

BULLETIN

Newark, N. J., July 27: Eddie Hasha on Goodyear tires makes new Eastern record for mile. Time, :38 2-5.

Riverview, July 31: Eight events and all won on Goodyear Tires. The stars were Renel and Champion Raymond Seymour who never lost a heat, winning three straights and taking Edgewater sweepstakes, 6 miles. Time, 4:09 2-5.

Application for 1913 Agency of

The *Indian* Motorcycle

Should be forwarded to us now. We are ready to consider them for the next year's model.

With over 100% increase in manufacturing facilities, machinery equipped with every modern device, an engineer staff constantly working out improvements and a host of expert mechanics making the motorcycles—our 1913 year will be not only the greatest in the history of the Indian but of the whole motorcycle industry.

By September 1st we will have shipped over 19,000 Indians of the 1912 model. Each one sold through an Indian Agent.

Now is the time to apply for 1913 Indian Agency.

A SAVING TIRE FOR MOTORCYCLISTS

Goodyear Motorcycle Tires are saving thousands of dollars for motorcyclists.

Next season they will mean a still bigger saving. For every motorcycle manufacturer in America has contracted for them.

Tests without number on our tire testing machine have proved the utter superiority of these tires.

These tests in which every other make tire is tried out, prove Goodyears to be the most durable tires in existence.

We build resiliency into our tires, too. They hold every world's amateur and professional speed record.

They are the tires that are satisfying all classes of riders.

MADE BY MAKERS OF NO - RIM - CUT TIRES

Goodyear Motorcycle Tires are made by the makers of Goodyear No-Rim-Cut Tires. Over 1,400,000 of these automobile tires have been sold. They render incomparable service. Now the world recognizes their superiority.

The same kind of quality that has made this tire famous is doing the same now for our Motorcycle Tires.

OUR TIRE MACHINE

Out of our years of tire building experience, we invented the tire-machine. This machine builds a flaw-proof tire. It is the only positive method by which flaws and weak spots can be kept out of tire construction.

A tire is made by stretching one ply of fabric over another. The usual method is to do the stretching by hand. But no human being can stretch on these plies hour after hour at the same tension. Yet uniformity of tension means strength of tire. Lack of it means weakness.

But with the Goodyear Tire machine weights do the stretching. The weights never vary. So the tension is always the same. Weak spots are thus eliminated. And our tires are thus able to successfully withstand tests of durability.

A TIRE THAT LASTS

This machine-built feature is only one of the many points of interest in our construction.

Altogether they have resulted in a motorcycle tire that is as perfect as a tire can probably ever be built.

Altogether they mean a vast saving in time and trouble and expense to riders.

Altogether they have been big factors in simplifying motorcycling and making it the popular sport of today.

SEND FOR OUR BOOK ON MOTORCYCLE TIRES

Every rider or prospective rider of a motorcycle should have this book and the vital facts on tire construction that it contains.

Write for it at once.

Goodyear pneumatic tires are guaranteed when filled with air at the recommended pressure. When filled with any substitute for air our guarantee is withdrawn.

BULLETIN Ray Seymour on Goodyear Tires won four cornered match race, three miles, time: 2 minutes, 1-5 second; won six mile Irving Park Sweepstakes, time: four minutes, eight seconds, also on Goodyears. Latter is track record.

SOME MOTORCYCLE DEALERS ARE unfortunate in starting wrong. They rely too much on misleading advertisements and the promises of traveling men,—who themselves are not familiar with manufacturing conditions. The dealer, too, often fails to investigate the capital, organization and manufacturing facilities of the concerns seeking to do business with him.

Hundreds of dealers have been disappointed this past season—which means that they have been compelled to conduct their business at small profit, if any.

If you are contemplating handling motorcycles in 1913, we believe you will be interested in becoming a dealer in **Indian Motorcycles**. Vacancies occur from time to time in choice territories. We occasionally find it desirable to make a change.

We are ready to consider applications now. Write today.

*NOTE—Over 19,000 Indians of the 1912 model,
all sold through dealers, are now on the road.*

“Count the Indians on the Road!”

These Motorcycle Tires Set Every Pace

Motorcyclists who want to ride fast have learned that they can rely on Goodyear Motorcycle Tires.

So have those who want to ride far.

When all these are counted there are but few riders left for other tires.

Goodyear Motorcycle Tires are the fastest, easiest riding, most resilient tires on the market. They hold every world's record. Both amateur and professional.

And tests on the Goodyear testing machine where all tires are tried out side by side, prove that they excel all others in durability.

So between greater speed and greater durability, it is not strange that Goodyears have captured the good will of the great majority of motorcyclists. It is not strange that thousands of experienced riders give them the preference.

Built on Tire Machines By No-Rim-Cut Experts

Goodyear Motorcycle tire riders do not fall heir to the troubles that overtake riders of hand-made tires.

For Goodyears are made by a scientific method on the Goodyear tire building machine. This machine forever does away with the danger of human mistakes creeping into the construction of the tire. It builds a tire that is absolutely flaw-proof.

This is the same machine on which experts build the

GOODYEAR

For 1913— **35,000 Indian Motorcycles!**

To produce this number of machines for the supply of Indian dealers, we placed our contracts for material last Spring. Deliveries were made commencing July 1st. At the same time we contracted for new machinery to be installed in the addition to our plant. Deliveries were made before the completion of the building operations.

With our increased manufacturing facilities, we are endeavoring to take care of the requirements of Indian dealers when the purchaser requests delivery.

Over 1,300 skilled mechanics are now employed in the Indian factory, each one a specialist in some branch of motorcycle construction.

Our 1913 agency contract season starts November 1st. If you are desirous of handling Indian Motorcycles, write us now.

Over 19,000 Indians of the 1912 model, all sold through dealers, are now on the road.

What Goodyear Tire Machines Afford Motorcycle Riders

MOTORCYCLISTS on all sides appreciate the *security* and the *saving* offered by Goodyear Motorcycle Tires.

These tires—the most durable made—have back of them a mighty organization. This organization renders a perfect service. This service is delivered through our innumerable branches and agencies which bring riders in hundreds of localities into close touch with the factory.

Such service, with such tires, makes Goodyear quality worth any man's while.

Riders—thousands of them—are insisting on *Goodyear Motorcycle Tires*.

Every American Motorcycle Manufacturer—30 in all—has made contracts for these tires.

For countless tests have proved these the most *durable* tires in existence.

The durability of these premier motorcycle tires is due to the materials of which they are made and the *way* they are made.

Thirteen years of Automobile Tire Building experience has taught us that it pays to use only the best of rubber and the best of fabric in our tires. None better than that used by us can be procured.

**Tires That
Stand Abuse**

GOODYEAR
AKRON, OHIO
Motorcycle Tires

**Extra Quality
Priced the Same**

Out of our years of experience we evolved a more scientific way of building a tire. We invented machines for the purpose of building our tires.

These machines—the same as those on which are built the famous No-Rim-Cut Automobile Tire—banish a fault common to all hand-made tires.

Instead of a tire built up of unequally stretched plies of fabric, you now have one that is absolutely uniform in tension—and in strength.

Instead of a tire apt to blow out any time because of hidden weak spots, you now have a tire whose construction is absolutely safeguarded against these weak spots.

Instead of a tire that may be a constant source of trouble, you now have one that thousands of riders will tell you is a constant source of satisfaction.

And all because of the service built into the tire by the machines we have invented and use.

Yet these machine-made motorcycle tires—these tires that render dependable service, cost riders no more than other kinds. Our enormous output has permitted us to pare the costs down to the quick. Riders can now obtain **Quality** tires at a **Quantity** price.

Realize that defective tires render useless the best motorcycle on earth.

Realize that here are tires vouched for by the greatest known authorities.

Realize that Goodyear Motorcycle Tires under every known condition of service are accomplishing more than all other tires put together.

Then choose the tires which you feel will best serve your own interest.

Wherever You Find Motorcycles There You Find Goodyear Tires

A glance at the tire equipment of the rows of motorcycles parked at races and elsewhere would make it appear that about every other single-tracker is Goodyear equipped.

The popularity of Goodyear Motorcycle Tires is one of the mightiest arguments supporting their now recognized superiority. The vast majority of motorcyclists are too practical-minded to adopt these tires so universally if they didn't render unusual service.

Nor would all the manufacturers—30 in all—have made contracts for these durable tires, had it been otherwise.

These tires—results of over 13 years' tire building experience—have solved the tire problem for both riders and manufacturers. Are they solving your tire problem?

A Knock-Out Blow for Blow-Outs

The constant danger of punctures and blow-outs has been practically eliminated by Goodyear Motorcycle Tires.

Manufacturers can now send out machines knowing the tires will give their full quota of efficiency.

Riders, no matter what roads they travel, no matter what the special duty they demand of their machines, no matter whether single or tandem, can now ride tires of **proved service**.

All because we have learned how to build endurance into motorcycle tires.

We have been building tires for over 13 years. The Goodyear No-Rim-Cut—with sales of over a million and a half—is the greatest triumph of tiredom.

And now we have motorcycle tires that are just as good as No-Rim-Cuts—tires that countless tests prove to be the most durable tires in existence.

Machine-Made Tires

From our long years of experience, we invented **machines** with which to build tires.

These machines produce tires, which, unlike hand-made tires, are absolutely free from the mechanical imperfections that result from an **unequal stretching** of the plies of fabric forming the tires.

These machines stretch on each and every ply with scientific accuracy. One is no tighter—nor looser—than another. The tire, uniform in **strength** because uniform in **tension**, **LASTS**—gives the service to which every motorcyclist is entitled.

WRITE FOR BOOKLET ON MOTORCYCLE TIRES

Do Most—Cost Least

Goodyear Motorcycle Tires cost no more than other tires. They actually cost less because they have reduced tire **up-keep** to a minimum, because they give **maximum service**. They are most economical because they last longest.

And remember, they are endorsed and used by the **greatest riders**—by the greatest tire authorities known, including the 30 big manufacturers who have made contracts for them.

Don't you think such tires are worthy of your investigation?

Hold Every World's Record

TELEGRAM! Another Astounding Proof of Goodyear Durability.

THE 1913 ANNOUNCEMENT

OF

The *Indian* Motorcycle

will appear in this publication the last week in October, and will be of extraordinary interest to the trade and motorcycle riders in general.

The 1913 Indian embodies improvements which will not only insure the retention of its supremacy, but will place it on the very pinnacle of motorcycle design and construction.

As an example of what can be accomplished in perfecting the efficiency of the machine and the ease and comfort of the rider, the 1913 model of the Indian Motorcycle surpasses all expectations.

What Men Have Decided Who Think for Themselves

Goodyear Motorcycle Tires Their Final Choice

For 13 years, we have been building tires. Out of this experience, we have evolved remarkable tires for motorcycles—tires in which motorcyclists who think for themselves have found the solution to the tire problem.

They have found tires that render the utmost of service. For these motorcycle tires excel in resiliency—excel in durability.

Their superiority has been demonstrated by an almost uninterrupted series of track victories—

victories which include the winning and the holding today of every world's record, amateur and professional.

And tests without number have proved Goodyears the most durable tires in existence.

So naturally men everywhere are turning to these tires. For they are tires of proved service—tires that practically end the liability of tire trouble—tires that treble the pleasure of motorcycling.

The Great MACHINE BUILT Tires

All Goodyear Tires must measure up to the high standard of quality set by the now famous Goodyear No-Rim-Cut Automobile Tire.

No tire built by ordinary methods could do this. No hand-built tire could possibly stand the Goodyear tests.

But machine-built tires can.

So our motorcycle tires are built on Goodyear tire machines—the same machines that built such spectacular durability into No-Rim-Cuts.

Most Durable Built Without Flaws

These machines are marvels of precision and accuracy. They stretch each ply at exactly the same tension. No too loose plies to shirk their duty. No too tight plies to break down under the unequal strain.

The result is a tire that is uniform in tension—uniform in strength and absolutely free of the flaws that make hand stretched tires uncertainties.

Backed By 13 Years

This is the only sure way of building Sure tires. And built thus out of the materials that our 13 years of experience has taught us guarantees most service, these tires guarantee their riders

most satisfaction—a satisfaction that two out of every three riders will experience the coming year.

The Popular Tire

For the majority of riders will ride Goodyears. Every motorcycle manufacturer has contracted for them for their next year's output. And riders on all sides are demanding of their dealers these more dependable, vastly more economical motorcycle tires.

Why Sacrifice Service?

Thousands of riders have learned the folly of accepting tire uncertainty and the wisdom of insisting upon Goodyears. They have learned that it is no longer necessary to sacrifice service for the sake of economy.

For Goodyear Motorcycle Tires, proven and dependable as they are, yet cost no more than riders expect to pay for a standard equipment.

If the advantages of such tires appeal to you, let us send you our book on Motorcycle Tires.

**Write for our Motorcycle
Tire Book Today**

"Count the Indians on the Road!"

The End of Aggravation Relief in Goodyear Motorcycle Tires

Tires that at once free riders from the tire trouble bugbear and save money.

Tires that are the utmost in easy riding qualities.

Tires that hold every world's amateur and professional **SPEED** record.

Tires proved by countless tests to be the most serviceable, the most durable motorcycle tires in existence.

Tires made by the makers of No-Rim-

Cuts, and up to the standard of these famously long-lasting automobile tires.

Machine made tires—tires that motorcycle manufacturers everywhere have contracted for—that two out of every three riders will ride in 1913—yet that cost no more than ordinary tires.

Such are Goodyears—the motorcycle tires of service. You pay for this service! If you are not getting it, why don't you?

The Perfected Tire

Motorcyclists can now have dependable tires—tires that as perfectly meet the demands of the motorcyclist as the best-known auto tire meets the demand of the automobilist.

Goodyear Motorcycle Tires are in reality small auto tires. They have over 13 years of auto-tire building experience back of them, and are made by the same experts who have perfected Goodyear NO-RIM-CUT Auto Tires.

The Goodyear tire machine, one of the evolutions of these thirteen years of experience, is an important factor

entering into the durability of our motorcycle tires.

This machine abolishes the possibility of flaws that are bound to creep into the common tire—the tire that is stretched by hand.

For this machine stretches on every layer of fabric with absolute **uniformity of tension**. No matter how big or little, strong or tired the operator is, the tire machine does its work without the slightest variation.

The result is a tire that the world recognizes today as being the leader—a tire that practically ends the aggravations of tire trouble.

A tire that has proved the most durable motorcycle tire in existence; a tire that reduces the danger of punctures and blow-outs, that minimizes tire cost, that affords riders the very max-

imum of service at the price they pay for common tires.

What Kipling Said About Imitators:

"They copied all they could follow,
But they couldn't copy my mind,
And I left 'em sweating and stealing
A year and a half behind."
—Kipling.

The 1913 Indian Motorcycle

We are advertising "11 IMPORTANT NEW FEATURES" in the 1913 models of the Indian. But in addition there are no less than 29 new minor features.

We call these "refinements." But on some other makes they would be loudly proclaimed as IMPROVEMENTS.

And mark this: The Indian models for 1913 were finally approved eighteen months ago. So that the machine you buy now is precisely the same as advertised in our 1913 Announcement, the same machine which will be exhibited at the motorcycle shows and at 1500 agencies throughout the country.

Ever notice how many "new" models of other makes come out AFTER the Indian? Some of them are not even laid down till the Indian appears, while others make hasty revisions before Show time. Therefore watch for the counterfeits of original 1913 Indian features—as usual.

Prices: 4 H. P. Single, \$200. 7 H. P. Twin, \$250. F. O. B. Factory

Made by Makers of
Goodyear No-Rim-
Cut Automobile
Tires

Hold Every
World's Record;
Amateur and Pro-
fessional

GOODYEARS—the machine-made motorcycle tires—have changed men's ideas on Motorcycle Tire service. What used to be the standard of quality no longer is—these tires have raised it. Two years of uncontested

leadership, thousands of tests of all kinds and the unqualified endorsement of these tires by the great authorities above prove them the most durable—the most serviceable tires in existence.

Read above the names of the great concerns we have *lined* up and *signed* up for Goodyear Tires next year. Think what it proves about Goodyear Quality. Then ask us to send our booklet telling all.

Mr. Motorcycle Rider

Please Answer These Tire Questions

Why is it that the oldest and most experienced motorcyclists use Goodyear Motorcycle Tires?

And why have these tires been able to consistently win and hold every world's record, amateur and professional, as they are doing today?

And why have the motorcycle manufacturers listed below adopted these tires for 1913 as they have done?

We'll tell you why it is.

It is because these tires are by countless tests the most durable motorcycle tires in existence. They serve where others fail.

That is why they are favorites with men who would avoid tire troubles.

That is why they are able to stand up under the terrific strain of racing.

And that is why they have won contracts from these manufacturers — manufacturers who know that by adopting Goodyears they are increasing the service and the value of their own manufactured product.

Can you think of any reason why you shouldn't be getting the advantage of such exceptional tire service as this must be? We can think of none. For our prices are the same as any standard tire, and our branches and agencies are everywhere.

Let us tell you why these tires have come into such prominence:

Our Tires Are Built On Machines

We have been building tires for over thirteen years. During this time we have learned about all there is to know about successful tire construction. We have learned how tires should be built to endure.

The Goodyear Tire Machine is an evolution of these thirteen years of experience. On these machines we build the famous No-Rim-Cut Auto Tire. No other method of building strength into pneumatic tires is so sure as this one. To it is now largely due the unequalled durability of these tires for motorcycles.

This machine forever does away with the danger of flaws and weak spots that are bound to creep into the common tire — the tire that is stretched by hand.

It stretches on every layer of fabric with absolute uniformity of tension. Regardless of size or strength of the operator the tire machine does its work without the slightest variation.

The result is a tire that the world recognizes today as being the leader—a tire that has proved the most durable motorcycle tire in existence—a tire that gives added mileage—that reduces the danger of punctures and blow-outs, that minimizes the tire cost, that affords riders the very maximum of service at the price they pay for common tires.

There are five great tires—one for every road condition. Every one is a proved success—an actual money saver. Let us tell you all about them. Write us or go see the nearest dealer.

*"The Twin's
the Thing!"*

The
1913

Indian

7 H.P. Twin Cylinder has the reserve power that carries you at any pace over any road. Through deep mud and sand and up steep, rough hills. Wonderfully smooth running motor.

New Cradle Spring Frame:—Equipped with recoil leaves and rubber bumpers. Positively no "bottom" to spring action. Normal working zone of 4 inches. Double scrolls at rear shackles, coming into action successively under light and heavy jolts. Hinged joint bracket has wide bearing surface, steel on steel. Oilers placed at all working points. Frame motion does not cramp chains. Rear seat-mast cluster a horseshoe-shaped steel casting of ample proportion for the service intended.

"A free demonstration from any of our 1500 dealers throughout the country. Wherever you ride, you're always in Indian Territory."

Prices { 4 H.P. Single, \$200 } f.o.b. Factory
 { 7 H.P. Twin, \$250 }

Another "Line-up" for Goodyears—the Machine-Made Motorcycle Tires

The above is a reproduction of a photo taken recently at the Los Angeles Motordrome.

It shows that here Goodyears are the popular tires. And the same condition will be found to prevail wherever you go.

Men prefer these tires because of the service they render—because they are the most dependable tires. Dependability is the vital essential of tires for motorcycles.

Two years ago our motorcycle production was in its infancy—

But we have forged ahead, until now we are in the lead. Our this year's output is nearly 5 times greater than that of the year before. And 26 motorcycle manufacturers have adopted these tires for 1913.

Next year there will be, we figure, more Goodyear Motorcycle Tires in service than all other makes combined.

All because men have found them out.

By Countless Tests The Most Durable Tires In Existence

We have been building tires for over 13 years. The Goodyear No-Rim-Cut Automobile Tire is probably the best liked tire today. Its sales have gone considerably over the seventeen hundred thousand mark.

It took an enormous amount of testing and experimenting—an enormous amount of human energy—an enormous amount of expense to produce this tire. But it paid. For the No-Rim-Cut has been crowned king.

And now motorcyclists come in for their share of the profit. They get tires

that are made out of the very cream of all these years of experience. They get tires proved by our metered tire testing machines to be the most durable tires in existence. Yet these tires cost only what motorcyclists expect to pay for any standard make.

Goodyears are more than just durable tires. They are the fastest tires made. They hold every world's record, amateur and professional. Which would indicate that our experts had about solved the tire question.

We build our tires on tire-machines

—the only sure way of proofing a tire against the danger of weak spots due to an **un-uniform** stretching on of the fabric. This is one of the big factors entering into the wonderful success of these tires.

When tires outsell all others as ours do—when they hold all world's records, when they are adopted by 27 motorcycle makers—the best known authorities on tire-service, then there must be something **distinctive** about them—something that **must** make them worthy of your investigation!

A new book on Motorcycle Tires is now being printed. Let us enter your name for one of these books to be sent you gratis as soon as it is off the press.

CONTROL!

ECLIPSE

There's a keen delight in the knowledge that your motorcycle is under your absolute control. The ability to curb your mount by a slight motion of the hand; at one moment crawling at a snail's pace—at another "burning up the road"; stopping and dismounting while the motor still throbs, ready to obey your every command—these are some of the delightful possibilities that the motorcycle affords, when it is equipped with the

ECLIPSE FREE ENGINE PULLEY and MULTIPLE DISC CLUTCH

No 1913 motorcycle will be without a Free Engine clutch of some sort. Watch the specifications of the leading manufacturers and see how prominently the Eclipse is displayed. It's a powerful asset to a motorcycle's reliability claims. You can rely upon the machine equipped with the Eclipse Free Engine Clutch because no manufacturer would be foolish enough to put such a high-class product as the Eclipse on an otherwise inferior machine.

Merry Christmas

Charles Dickens
Robert Louis Stevenson

Clement C Moore
James Whitcomb Riley
F Hopkinson Smith

Henry Van Dyke
Eugene Field

"My friends, my vely dear friends, I should say, for I omit none of you—befo' I kindle with the torch of my love these little beacons which are to light each one of us on our way until another Christmas season overtakes us; befo', I say, these sparks burst into life, I want you to fill yo' glasses!"—Col. Carter's Christmas Tree.—F. Hopkinson Smith.

"I don't know what to do!" cried Scrooge, laughing and crying in the same breath and making a perfect Laocöon of himself with his stockings. "I am as light as a feather. I am as happy as an angel. I am as merry as a schoolboy. I am as giddy as a drunken man. A merry Christmas to everybody! A happy New Year to all the world. Hallo, here! Whoop! Hallo!"

"He had frisked into the sitting room and was now standing there, perfectly winded.

"I don't know what day of the month it is," said Scrooge. "I don't know how long I've been among the spirits. I don't know anything. I'm quite a baby. Never mind. I don't care. I'd rather be a baby. Hallo! Whoop! Hallo here!"

"He was checked in his transports by the churches ringing out the lustiest peals he had ever heard. Clash, clang, hammer, ding, dong, bell. Oh, glorious, glorious! Running to the window he opened it and put out his head. No fog, no mist; clear, bright, jovial, stirring, cold; cold, piping for the blood to dance to; golden sunlight; heavenly sky; sweet, fresh air; merry bells. Oh, glorious. Glorious!"

"What's to-day?" cried Scrooge, calling downward to a boy in Sunday clothes.

"To-day!" replied the boy. "Why, Christmas Day."

"It's Christmas Day!" said Scrooge to himself. "I haven't missed it. The spirits have done it all in one night. They can do anything they like. Of course they can."—Dickens.

"To be honest, to be kind; to earn a little and spend a little less, to make upon the whole a family happier for his presence to renounce when that shall be necessary and not be embittered, to keep a few friends, but these without capitulation; above all, on the same grim condition, to keep friends with himself—here is a task for all that a man has of fortitude and delicacy. He has an ambitious soul who would ask more; he has a hopeful spirit who should look in such an enterprise to be successful."—Robert Louis Stevenson. A Christmas Sermon.

Probably more grown men and women can repeat to-day: "Twas the Night Before Christmas" than can remember any other poem of equal length in the language. They may have forgotten the name of the author, Clement C. Moore, but they can reel off the beginning glibly enough:

"Twas the night before Christmas and all through the house
Not a creature was stirring, not even a mouse;

The stockings were hung by the chimney with care

In hopes that St. Nicholas soon would be there;

The children were nestled all snug in their beds,

While visions of sugar plums danced in their heads.

And how these elocutionary lights, as well as the rest of us who are not vocally inclined, have revelled in Eugene Field's delicious "Jes' 'Fore Christmas."

"Father calls me William, sister calls me Will,

Mother calls me Willi—the fellers call me Bill!

Most all the time the hull year round there ain't no flies on me,

But jes' 'fore Christmas I'm as good as I kin be!

And the pious smugness with which this interesting imp concludes its unctuous joy to the soul of the reader:

But Christmas, with its lots and lots uv candies, cakes and toys,

Wuz made, they say, fur proper kids and not fur naughty boys!

So wash yer face an' bresh yer hair an' mind your p's and q's,

An' don't bust out yer pantaloons an' don't wear out yer shoes.

Say "yessum" to the ladies an' "yessir" to the men,

An' when they's company don't pass yer plate fur pie again;

But, thinkin' uv the things you'd like to see upon that tree,

Jes' 'fore Christmas be as good as you kin be!"

"They's a kind o' feel in the air to me When the Christmas time sets in

That's about as much of a mystery As ever I've run ag'in.

Is it the bleat o' the whistle and beat O' the little toy drums and blare

A' the horn? No! No! It is jest the sweet—

The sad-sweet feel in the air!"

James Whitcomb Riley.

"Hang up the baby's stocking;
Be sure you don't forget;
The dear little dimpled darling,
She ne'er saw Christmas yet."

Henry Van Dyke preaches another pretty good sermon in "The Spirit of Christmas," which was published seven years ago. He says there is something better than keeping Christmas Day, "and that is keeping Christmas. Are you willing to forget what you have done for other people and to remember what other people have done for you; to ignore what the world owes you, and to think what you owe the world, to put your rights in the background, your duties in the middle distance and your chance to do a little more than your duty in the foreground; to see that your fellowmen are just as real as you are, and try to look behind their faces to their hearts, hungry for joy; to own that probably the only good reason for your existence is not what you are going to get out of life, but what you are going to give, to life to close your book of complaints against the management of the universe, and look around you for a place where you can sow a few seeds of happiness—are you willing to do these things even for a day? Then you can keep Christmas."

"Are you willing to stoop down and consider the needs and desires of little children; to remember the weakness and loneliness of people who are growing old; to stop asking who much your friends love you, and ask yourself whether you love them enough; to bear in mind the things that other people have to bear in their hearts; to try to understand what those who live in the same house with you really want, without waiting for them to tell you; to trim your lamp so that it will give more light and less smoke, and to carry it in front so that your shadow will fall behind you; to make a grave for your ugly thoughts and a garden for your kindly feelings, with the gate open—are you willing to do these things even for a day? Then you can keep Christmas."

"Are you willing to believe that love is the strongest thing in the world—stronger than hate, stronger than evil, stronger than death—and that the blessed life which begun in Bethlehem nineteen hundred years ago is the image and brightness of the Eternal love? Then you can keep Christmas. And if you can keep it for a day, why not always?"

"And so, as Tiny Tim observed, God Bless Us, Every One!"

Says Longfellow:

"I heard the bells on Christmas Day
Their old familiar corals play.
And wild and sweet
The words repeat
Of peace on earth, good will to men!"
